the Tool Company are of good capacity and can lift the water higher than it was formerly supposed that centrifugal pumps could.

Copper.

The outlook for an advanced price for copper this coming spring is not very bright. The great Lake Superior Company is delivering several million pounds this month and next at 11

amount exported by each copper producing section. Copper produced in one section goes to other works for treatment, is refined in another locality, so that its identity is entirely lost. For instance, copper matte made in Montana goes with material from other sources to the Argo Works of the Boston and Colorado Smelting Co., and, after extracting the precious metals, a part of it is sent abroad; another part is refined in the East and is sold to consumers. It

Arizona product, it is stated, is consumed at home. The more refining works we establish in this country the better it will be for our copper industry.

Metallic Manganese in Ore.

Very little has ever been done with what manganese deposits have been found in this State. In one instance last year a deposit was opened and several tons shipped from Santa Clara county, but it was found that the demand was limited here, and further work stopped. The distribution of manganese ores in this country is almost co-extensive with the deposits of brown hematite ore. At times the manganese displaces so much of the iron as to make the ore a manganiferous iron ore, while at other times, in close association with the iron ore, veins or pockets of manganese ores will be found. This statement is specially true of the hematite ore beds of the great Appalachian range from the northern to the southern extremity.

Though manganese is found in many sections, there are but three or four localities that are yielding any amount of ore. These are the Crimora and Mt. Athos mines, in Virginia; Cartersville, Georgia; and Batesville, Arkansas. So far as known the valuable deposits of manganese have been in pockets usually imbedded in a tenacious clay which requires washing to remove.

Most of the ores utilized in this country are oxides. Mr. Joseph D. Weeks, who has written an excellent article on manganese for the last Report on "Mineral Statistics of the United States," gives the following description of the four oxides utilized:

Protoxide—known also as the monoxide or manganese oxide. Multiplying the amount of protoxide in an ore by .7746 will give the metallic manganese in the ore.

Sesquioxide, braunite or brown oxide, is known also as manganic oxide. This oxide occurs in nature as braunite, and in the state of hydrate as manganite. This, in the form of braunite, is one of the most important ores of manganese occurring in this country. Multiplying the amount of sesquioxide in an ore by .6392 will give the amount of metallic manganese in the ore.

Peroxide, pyrolusite or black oxide, is, with braunite, the most common ore of manganese in the United States. Psilomelane contains the peroxide. Multiplying the amount of peroxide in an ore by .63218 will give the amount of metallic manganese in the ore.

Hausmannite is a brown manganese oxide, containing, theoretically, 72.1 per cent of metallic manganese.

THE erection of reduction works at Reno, Nevada, has given an impetus to private mining, and large lots of ore, from even remote camps, are being sent thither for shipment by individuals who have not the means with which to erect mills or furnaces.

THREE large stamp mills at Butte, M. T., closed down on the 20th for want of salt, and two more will close, thereby stopping work in all the silver and copper mines and throwing about 3500 men out of work. The trouble is due to the snow blockade.

THERE is more demand for mining property, and more sales have been made in New Mexico and Arizona in the last six months, than there has been for several years.

CENTRIFUGAL PIT PUMPS FOR IRRIGATING WORKS.

cents, it is true, but the impression prevails that the coming summer will see the price at 10 cents, as it was last year. Of course, in case of a war in Europe, the market might be influenced so as to keep prices up. The Arizona mines, with the disadvantage of long distance from, and high freight to, commercial centers, need a better price to make much money. They can make a profit, however, even a cent below the present price, but with such competition as the Montana and Lake Superior mines, will have to look sharp after expenses.

We produce a vast amount of copper in the United States, which is sent to foreign markets. It is very difficult to get at the exact

will be seen the original source is uncertain.

The refiners themselves, receiving furnace material from many quarters, ship ingot to Eastern markets, and they probably could not, if they desired it, ascertain whether it was Montana or Arizona product. The figures for exports, furthermore, do not exactly tally with the shipments from some localities like Montana, because varying quantities are in transit from the Rocky mountains to the Atlantic and Pacific coasts. It is a matter of moment to the different producing sections to obtain some clear conception to what extent its product is placed on the more valuable home market, since export shipments imply a sacrifice. The bulk of the

Treatment of Black Sand.

The following is a brief description by J. F. Sanders, in the *Arizona Enterprise*, of treatment of concentrations, as obtained from placer mines, and many gold ores: There are two methods of treatment, the first by acids—the wet way or analysis—and the second by fire or dry way.

First—The wet process or analysis, as furnished by Bruno Kerl, is one which gives absolute accuracy, but requires considerable skill and experience. The concentrates are dissolved in aqua regia (one part of nitric and two parts of hydrochloric acid); when completely dissolved a solution of manganate of potassium is slowly added, which precipitates the iron, etc., as oxides. This precipitate is filtered off and a current of sulphuretted hydrogen gas is passed through this neutralized solution until yellowish crystals of sulphur appear in the same. The resulting precipitate is of a dark-brown color and contains gold, silver, platinum, copper, bismuth, tin, cadmium, etc. (of course, provided that these metals existed in the concentrates). The precipitate is now freed from the solution by filtration or decantation, and then alternately treated with nitric and hydrochloric acids. In this manner, silver, copper, tin, bismuth and cadmium are entirely dissolved and thus taken out of said precipitates, and only gold and platinum remain. Diluted aqua regia will now dissolve the gold, and none, or but very little, platinum. This solution is then evaporated to nearly dryness to remove acids, and then again dissolved in pure water; the gold may now readily be precipitated by a solution of ferrous sulphate. The ensuing precipitate is dried and weighed, or may be first smelted into a button of pure and solid gold.

Another method, which gives very good results in gold out of these concentrates, is practiced by the jewelers to obtain the gold from the filings, etc. Such filings contain, besides gold, large quantities of steel, iron, and some silver, copper, etc.

By this method, as above, a certain quantity of concentrates is weighed out and then dissolved in aqua regia. When dissolved, a little sulphuric acid is added to the solution, and some iron nails or other suitable pieces of metallic iron are introduced into it. The ferrous sulphate is thus produced in said solution, and the iron, chrome, etc., is suspended in the acidulated solution, and only gold and some little iron are precipitated after some time, and is generally finished in from 10 to 15 hours. The precipitate is the same as above, and is, like it, dried and smelted into a button and weighed.

To dissolve the gold in aqua regia and then precipitate it out of such solution directly by ferrous sulphate, as practiced for pure gold, or metallic alloys of gold with silver, copper, etc., does not and cannot give any results for such mixtures of metals and metalloids as are found in the above concentrates, or the so-called black sand.

Second—The dry way or fire process. The best, quickest and most practical process (thus far) of obtaining good results in gold from the concentrates in question is the hydro-oxygen blowpipe, invented in 1797 by Prof. Hare, of Philadelphia, Penn. In a furnace constructed by M. St. Clair Deville, of Paris, France, a charge from a very little up to 100 pounds, properly fluxed and mixed, is completely reduced in from 20 to 60 minutes. This process has not only the advantage of giving the greatest pyrometric effect, but also by its oxygen gas may at any moment be put on in excess, and thus the operation be changed from a reducing to an oxidizing smelting, and vice versa. When such concentrates contain any bismuth, tin or other desirable metals that are likely to be oxidized, they are extracted by lixiviation before smelting, if possible. The regulus is then refined in the usual way in case platinum, silver, etc., were present in the original charge.

The ordinary silver assay, as is commonly practiced, gives very unsatisfactory results, because these concentrates contain 40 per cent of metallic iron, and usually a still larger amount; and these oxides of iron, with chrome oxides, etc., inclose to a great extent the fine particles of gold—both of some native gold and sulphide of gold. This fact may readily be seen by placing some of such concentrates under a powerful microscope, which will thus show particles of gold protruding out of the sides of some of the grains of concentrates. Again, by dissolving some of the larger pieces of concentrates in nitric acid (some pieces may thus be dissolved) a residuum of very small particles of gold will result in most cases. Moreover, in many placer mines large pieces of iron are found which have native gold, visible to the naked eye, on them or protruding out of them.

It is an absolute fact that in a common assay furnace, hardly ever sufficient heat is produced to smelt such iron ores, or to fuse to such an extent that the mass becomes sufficiently liquid to permit the gold to settle out of the slag to the bottom, or to come in contact with, or be absorbed by, the test lead. Moreover, the lead employed in an assay of such concentrates fuses and settles to the bottom of the crucible long before the iron in the same has even become a thin paste or is fused, while the smaller particles of lead are held suspended in the half molten mass. According to good authority, it is all a large blast furnace can do to reduce

such ores even in small quantities added to other ores that fuse easier.

In order to obtain better results by the ordinary assay, it is well to roast such material very carefully and in a good heat. The particles of iron, while thus taking up more oxygen, break into smaller pieces and some of the gold is freed from its inclosures, pulverizing to an extremely fine powder and then fluxing for and smelting at a tolerable high degree of heat. In smelting, oxidizing fluxes should be added from time to time, until sulphur fumes cease to escape. The smelting mass should be stirred up at intervals, and then, finally, a charge of litharge is added. When the mass fuses quietly again, or is well fused, it is poured off, and the regulus treated in the usual way.

Another way which gives approximate results, is to treat the concentrates before smelting alternately with nitric, hydrochloric and sulphuric acids, taking care that no aqua regia is formed, which would dissolve the gold. Much material that interferes with the bringing out of gold is thus removed; it is then again dried, pulverized and smelted as above.

In the Ural mountains, in Russia, and other places in the same country, the concentrates are obtained by this sweeping process since 1824, which has been a success both in a financial and technical way.

Cheap Ore Treatment.

The following is condensed from an article by T. J. Hough in the *Golden (Colo.) Transcript*:

Since the opening of this new year a number of bona fide transfers of gold-bearing lode properties, located in undoubted gold-bearing localities, have been reported. The two most noted transfers occurred at Idaho Springs, and which conveyed very rich gold-bearing lodes in the new gold belt of Soda creek. These properties referred to have been successfully worked for a number of years, but not with the profit that mill-runs and sample assays of the ore would seem to warrant. This is owing to the vast quantities of low-grade ore, or gangue, associated with this high-grade or smelting ore, which alone can be profitably shipped by rail, at the present freight rates, 20 or 60 miles to the smelters for treatment. Below \$30 a ton, dry gold ore is practically valueless to the miner, as the high prices usually charged by the smelter for treatment, combined with rail and cartage charges, leaves little or no margin to the mine-owner and miner or leaser, as the case may be. The great loss to miners consequent upon their inability to turn low-grade gold ores to profit has long been fully appreciated; but outside of Black Hawk practically nothing has been done toward building extensive stamp mills for the reduction of gold ores. Efforts have been made, it is true; but, with the possible exception of the English company's mill at Fall River, above Idaho Springs, the Barber mill on Soda creek and a ten-stamp water mill on Chicago creek, wreck and ruin mark the sites of blasted hopes and wasted ducats. The cause of failure must be sought elsewhere than with the mines and the miners. A ton of ore that will assay \$20 gold should yield, by the most careless treatment under stamps, \$10. Allowing six tons to the cord of surface gold ore (it is oftener eight), we have \$60 as the product of one cord. A battery of heavy stamps, such as is in use in Gilpin county, will reduce one ton of ore every 24 hours, if properly tended. A mill of ten such batteries would reduce ten cords a day and 260 cords a month, which would yield \$600 a day, \$15,600 a month of 26 days, and the handsome sum of \$187,200 a year, from 18,720 tons of mill-dirt that to-day is valueless owing to the want of a cheap method of treatment.

The old-time stamp mill in use in Gilpin and Clear Creek counties, for cheapness and efficiency in reducing gold-bearing rock to a pulp, is not excelled by any other method yet discovered. The only difficulty to be overcome in the successful treatment of the low-grade ores so abundant in the gold districts of the above counties is the great cost of the power necessary to keep the stamps in continuous and steady motion all the year round.

Water-power is both cheap and efficient where practicable, but no gold district in either of our neighboring counties can depend on water as a motor for more than seven months in the year. Steam is out of the question except for exploring and experimental purposes in the treatment of surface auriferous ores, the cost being so great that only the most urgent necessity should ever induce the erection of steam mills for the reduction of precious metal ores by the stamp process.

This article is written with the desire to attract the attention of capitalists to the vast unappropriated water-power of Clear Creek canyon, which can best be utilized for the production of a force in a conductive form for many miles from the place of generation without losing any of its energy, and this can only be done cheaply in the present state of scientific knowledge by means of compressed air.

THE U. S. Senate has passed the bill giving to California, for school purposes, 5 per cent of the sale of all public lands since California became a State. It is estimated that this will bring the State about \$500,000. It is said that there is a very good prospect that the bill will be got through the House.

THE 22 quartz mills in Storey county, Nev., crushed during last year 228,743 tons of ore,

Carbonate Hill.

The New Southern California Mines.

Messrs. Hampton, Wason, Smith and Halvey returned from the mining regions Saturday evening and bring encouraging reports from that section. Martiu Halvey, a mining expert sent out by a Los Angeles company, gives his opinion about as follows:

I am a mining man of many years' experience and may be called an expert upon the subject. I have visited about all the mining camps on the Pacific Slope—Virginia City, Grass Valley, Ivanpaw, Calico and others—and must say that I have never seen anything in my life to compare with these mines discovered by Col. Smith. The whole country seems to be full of gold and there is room for a great many miners. The claims shown me by Col. Smith beat anything I ever saw. I am satisfied that this is a continuation of the Calico belt. I shall return to Los Angeles to-morrow with some specimens of ore I obtained over there, and will return to the mines in about two weeks. The company I represent will undoubtedly put in a large mill in a very short time, but I am not prepared to give other particulars at present.

The party located several claims, from which they bring very rich specimens.

About 150 men are in the camp now and more coming in every day. J. V. Jesse, surveyor of Santa Maria, has been engaged during the past week in laying off the town site of Lexington. Several lots have been sold and a lively mining camp will doubtless spring up in a few weeks' time. The town is situated at the northern base of Alamo mountain, at the junction of the Piru and Lockwood creeks, and covers 640 acres. Pine timber and water are there in abundance and parties contemplate putting up a sawmill. Miners from all parts of the State are flocking in, and soon the camp will boom in earnest.

The country for several miles square contains rich mineral matter, and there appears to be room for a great many more claims; several parties have taken up placer claims. A party will leave Ventura some time this week for the mines by trail, and later a four-horse wagon-load of provisions, tools, etc., will be sent over. Some of the specimens brought in have been tested and found to be very rich in gold and silver.

The parties who seem to have located the richest claims so far are Messrs. Chas. Wason, Col. Smith, J. D. Hampton, Mr. Halvey, W. H. Reilly and DeMoss Bowers.

Since our geological reconnaissance several years ago, we have been convinced that somewhere near the head of the Piru creek was a ledge of rich gold quartz from which came the deposits in that stream. We shall not be greatly surprised to learn that the section alluded to yields a wonderfully rich harvest to the miner. Of course no one can fully determine the value of this find until it is scientifically tested; but the experts who have examined the locality each and all claim that it is rich in the precious metals. We do not want people to go there on our recommendation, but we have sufficient faith in it to have a claim recorded and expect to have it worked in due time. We learn that parties who have had much experience in mining will put up a 50-stamp mill soon, and the probabilities are that by the time the rainy season is over there will be several hundreds, if not thousands, of miners in the new town of Lexington prospecting for gold. If any one interested will call at our office, we will show him specimens picked up from the surface of our claim, carrying plenty of free gold. But we repeat that the only way to know certainly what it is worth is to have it tested by a competent assayer.—*Ventura Free Press*.

AT BALLONA.—Work at the lake is just beginning with a vim. The schooner Conner is lying off shore some distance with a cargo of 250,000 feet of lumber (piles), and she is now discharging by floating them ashore. A donkey engine is on the beach ready for operation. A heterogeneous mass of bolts, bars, ropes, etc., is heaped all around. No piledriver was in sight, but there is one somewhere, which will be in position as soon as needed. The tide flows in and out through the channel that has been cut between the lake and the ocean. The water at high tide is from five to six feet deep. It will be a herculean labor to make a harbor down there, but no doubt money, energy and capital will do it. In the mean time we understand that it is the intention to project a wharf out into the ocean. This will bring ship and rail together, as it used to be at Santa Monica. The grading of the railroad to Los Angeles is to be completed by the first of June, which will give ample time for the completion of the wharf. The indications are that the locomotive and the steamship will mingle their smoke not later than the first of July at La Ballona.—*Santa Monica Outlook*.

SENATOR STANFORD appears to have caught the prevailing infection in regard to appropriating money for coast defense. In furtherance of this object the Senator has introduced a bill to provide for plants, to cost not less than \$1,000,000 each, to be established by private parties at San Francisco, Birmingham, Ala., Pittsburg and South Boston, who are to be given contracts to build such mortar guns or other armament as the service, army and navy, may from time to time require.

American vs. Russian Petroleum.

There has been some fear expressed of late, lest the Russian oil wells at Baku might supersede American petroleum in the markets of Europe; but a recent English writer sets all such fears at rest by the following, which we take from quite a lengthy article upon the subject in a late number of the *Pall Mall Gazette*:

1. United States crude petroleum-oil is to Russian crude as cream to skim milk. United States crude yields about 75 per cent of the finest illuminating oil the world produces. Russian crude yields only about 29 per cent of an inferior illuminating oil. United States crude yields about 12 per cent naphtha or spirit of such a valuable character that it readily sells for 20 per cent per gallon more than the oil. Russian naphtha is unmarketable and it is mostly burned to get rid of it. United States lubricating oils, another product of crude, are now so low in price that Russian lubricating oils are practically debarred from competition in many of the European markets. United States crude yields a considerable percentage of scale, used for candle-making, and this is a product of great value; weight for weight it is worth four times more than refined petroleum oil. The Baku crude yields no scale. Thus the United States in the surpassing richness of its crude has an enormous and unapproachable advantage over Russia.

2. The daily production of the United States is in excess of the world's demand, and has been so practically for the last 10 years. In addition to the excess in the daily production of the United States, there are stored there, above ground, 31,800,000 barrels of 42 gallons each, the actual unmarketed accumulations.

3. United States oil is superior as an illuminant to Russian oil. A comparison of the respective prices of the United States and Russian oil at the chief European markets will show the commercial appreciation of the superiority of United States oil.

4. The United States command the available markets of the world with an organization backed up with immense resources, economic, complete, perfect, the power of which the Russian industry now knows to its cost. (In 1876 the United States refiners sold their oil at 33 cents per gallon; recently their price has been 6½ cents per gallon, barrels included, and yet the American companies pay good dividends, and the shares for the greater part command high premiums.)

The writer of the above further says that the Baku petroleum trade is said to be in the throes of a crisis; that it has for the past few years been laboring under extraordinary pecuniary difficulties; that prices for Russian crude and its products have declined to such a low figure that sales, except at a loss, are difficult to make; and that over 40 of the Baku refineries were recently closed, and many others partially so, all of which is attributed to the reckless manner in which the Russian trade has been forced in the effort to compete with American oils in the European markets. As to the large production, the writer says that an official government statement reports the territory in which the remarkable well is located as showing "evident signs of exhaustion."

MR. WILLIAM DODGE, JR., some of the Baku Divids mine-owners, and a few other Oakland parties, have lately purchased from a Chinese company the bar in the Middle Fork, known as Boston bar, and have arranged with the owners of Horseshoe bar to purchase that also. This gives them nearly two miles of river-bed to work. They intend cutting a tunnel under Horseshoe bar, the length of which need only be about 180 feet, and large enough to carry all the water in the river, which is there very crooked, and, as before stated, gives them nearly two miles of river-bed to work, most of which has not been worked for 20 years. They have lately filed articles of incorporation under the name of the "Horseshoe Bar Mining Company."—*Placer Argus*.

THE editor of the *San Mateo Times and Gazette* has put on foot and has urged with perseverance a movement to create a park in the redwood forests. The object is to perpetuate, through the instrumentalities of a State law, a large acreage of redwood forests as a public resort and as an evidence of the beauty and magnificence of the famous tree. A bill to this effect is before the Legislature. A very good place would be the fine grove near Russian river, where the Bohemian club has of late years held its "Midsummer Jinks." The trees are fine and large, and the place is a favorite for campers, as it is readily accessible from the city by rail.

STOPPED FOR WANT OF FUEL.—Several of the smaller quartz mines of this district have been compelled to suspend operations on account of the difficulty and expense of obtaining fuel. The winter was so mild up to the first of the present month that it was supposed there would be no trouble in getting wood as required, and hence they have been "caught out" by the succession of storms that have invaded the "Bartlett Pear Belt" in the last few weeks. But the gold in the ground will not diminish in quantity on account of being buried beneath the snow, and the miners will renew their boom when the spring opens.—*Grass Valley Union*.

Efficiency of Different Forms of Boilers.

At a recent meeting of the Engineers' Club of Philadelphia, Mr. John E. Codman presented an account, illustrated by blackboard sketches, of the results obtained from the recent tests of the efficiency of different forms of boilers now in use by the Philadelphia Water Department. The boilers first tested were four in number, and known as double-decked, a popular form in Philadelphia, and supposed by many to be an economical steam generator. The lower boiler generally contains about as many tubes as the tube sheet will safely hold; the upper boiler, or drum, is connected to the lower one by two or more necks, and the water is usually carried so as to half fill the upper drum. In the trials mentioned, the height of water was measured from the bottom of the upper drum. For 16 hours it was kept at 5½ inches from the bottom, and for 8 hours at 12½ inches from the bottom. This difference is not very great, but the results obtained show the advantage of keeping the water as low as possible in the upper drum, as, with high water, much that is obtained is only apparent evaporation.

Some discussion followed. President Washington Jones said: "In the so-called double-decked boilers, the contracted passages or necks connect the upper and lower sections, through which the steam formed in the lower section rises to the upper one with such a high velocity as to carry entrained water, which passes to the steam pipe and is credited as steam, unless the calorimeter test reveals its presence. This disposition to carry water is augmented by the increased velocity of the ascending steam, caused by the injudicious crowding of the tubes nearly to the top of the lower section, and by insufficient space between the vertical rows, so that the passageways through the necks are thereby obstructed. The better practice is to omit such tubes as come immediately under the necks, leaving a space of several inches (say one-half the diameter of the necks) between the shell at the necks and the adjacent tubes, so as to obtain a more quiet liberation of the steam bubbles. The necks should be of limited diameter, ordinarily from 10 to 14 inches, so that the strength of the shell shall not be impaired by the holes cut in it to match the necks. More than two necks are injurious, as the upper and lower sections should not be rigidly bound together, but should be permitted to alter their parallelism if unequal expansion demands it. The greater quantity of steam formed at the front, or furnace end, of the boiler should establish a circulation upward through the front neck and downward through the back neck. This, however, is evidently not the fact, as the quick and frequent fluctuations of the water line, shown by the glass gauge, prove. When a volume of steam greater than usual is generated in the front end of the boiler, the quickened ascent of the current causes a larger quantity of water to flow through the front neck into the upper section, and the water line rises momentarily at the end of the section, and is so shown by the glass water gauge; meanwhile, the water is passing down the neck at the back end. When the ebullition at the front becomes quieter, and the upward current slower, the water line falls to a level, or possibly below it, at the front end, if the back neck is giving a passage to steam formed at the back end of the boiler, and so reverses the currents. One requisite of the first importance to the evaporative efficiency of a boiler is the production and maintenance of a constant current of water, passing without change of direction, over the heated metal surfaces, so as to sweep off the steam bubbles adhering to those plates, and bringing into their place fresh particles of water to be, in their turn, converted into steam bubbles."

HODGDON, of Eureka, Nevada, who was acquitted of the charge of arson by the court the other day, was given a ride on a rail by the miners of that camp, and ordered to leave. The charge was that Hodgdon attempted to set fire to the Geddes & Bertrand Hoisting Works, in Secret Canyon, by pouring upon the shingles around the smokestack a large quantity of turpentine, and that giant or Hercules powder had been cut up and pressed under the shingles. These explosives were also saturated with turpentine, and were placed around and near the smokestack and in the immediate vicinity of a number of pitch pine sticks that had been emersed over with giant powder, and in the crevices of which matches had been placed. The supposition was that these had all been placed so that the heat from the smokestack would ignite them and cause an explosion, and through that means destroy the hoisting works and at the same time kill Engineer Dennison, with whom Hodgdon had some trouble in regard to a mining patent. There was not sufficient evidence to convict the prisoner, but the miners of the camp thought him guilty.

A COSTLY CATHEDRAL SINKING.—St. Isaac's, the great cathedral at St. Petersburg, which was finished in 1859 and cost over \$25,000,000, is slowly sinking into the ground, and the authorities do not know how to stop it. Possibly they might learn a lesson from the American engineers who arrested a similar settling of the Washington monument, the highest artificial structure on the globe.

Yerba Mansa.

We give on this page an engraving of a native plant which, no doubt, many of our readers have observed, as it is quite a conspicuous plant and sometimes occurs in considerable masses, especially in the Southern counties, although it is widely distributed over the State. It is found in moist places and is most abundant where there is a tinge of alkali in the soil. It is a plant of valuable medicinal properties, and, for the purpose of giving opportunity to test these, some of the plants were set in the medicinal division of the Garden of Economic Plants at Berkeley. The root stock of the Yerba Mansa was much employed by the Indians as a remedy for a number of bodily ailments, and was probably most useful in diarrhea because of its astringent

cal receptacle above the involucre. They are very small and numerous, each with a small, whitish bract at its base. Each flower has six to eight stamens, and three or four spreading stigmas joined below in a many-seeded ovary.

The Elsinore (San Diego) News contains the following important information: Parties at work in the shaft being sunk by J. D. Hoff & Co. for coal were successful the latter part of last week in striking coal of a very good quality. This gave them new energy and encouragement, and they went on sinking for other veins which Mr. Hoff, who is well versed in the nature of coal fields, was confident would be struck. The second vein was struck at 118 feet, and is 20 inches in thickness and of extraordinary quality, being very hard and bright. Between each vein is found a layer of clay, also of superior quality. The 20-inch vein Mr. Hoff proposes to work, and at

YERBA MANSA—Anemopsis Californica.

properties due to the amount of tannin contained in it.

We reproduce this engraving of the Yerba Mansa from the report of Dr. Vasey, Government botanist, in the Department of Agriculture Report for 1885. The botanical name of the genus *Anemopsis* was given because of the resemblance of its head or cone of flowers, with its white involucre, to an anemone. The plant is an herbaceous perennial, and grows in California, Arizona and Northern Mexico. It belongs to the natural order *Piperaceae*. It has a thickish, creeping root-stalk, which has a pungent, aromatic, and astringent taste. From this proceeds a number of oblong or elliptical leaves, from two to six inches long and half as wide, on stalks as long as the blade. These leaves are entire, obtuse or obtusish, with a thick midrib and a two-lobed or heart-shaped base. From the same point also proceed one, two or three flowering stalks, six to eight inches high, which are naked below, near the top producing a broadly ovate, clasping leaf, and one or two leaves like the radical ones, but smaller, terminating with a conical, compact flowering spike, one-half to one and one-half inches long. This flower spike has at its base an involucre of five or eight whitish, oblong leaves, which look like petals, and are about an inch long. The true flowers are on the con-

the same time continue the sinking of the shaft, which be thinks will reveal much greater beds of coal. In the Chaney coal mine, being one and one-half miles distant, five veins have been struck, and it is on the fifth that they are now working. In that mine each vein was better than the one just before; this will undoubtedly be the case in the latter discovery, as the veins are thought to be a continuance of the former discovery. Judging from the quality of the coal of the second vein, and as each vein grows better, the fifth will be equal to imported coal. The clay, which will be excavated and pressed into brick, will pay for the mining of the coal. Machinery sufficient for hoisting 200 tons per day will be immediately procured.

THERE is an awakening at Eureka, Cal., in the redwood timber purchase. Lately thousands of acres of timber have been bonded to representatives of Western and Northwestern capital, and other speculators who live beyond the Mississippi are on their way here. In many instances the late holding prices have been doubled. Minnesota, Wisconsin and Michigan speculators take the lead in bonding for purchase.

THE six petroleum wells at Puente are now yielding 100 barrels a day.

MINING LEGITIMATE.—Many people do great injustice to the investor in mining properties or prospects when they call him a "gambler" or "speculator." There is a large element of chance in mining, but that element exists in a greater or less degree in almost every one of the occupations called legitimate. Speaking of the chances one takes in making an investment, an exchange truthfully remarks: The miller lays in a big stock of wheat in the hope that the price of flour will advance while he is grinding it. The wholesale grocery merchant buys a large stock of sugar when it is cheap and stores it away in anticipation of an increase in market value. The clothing merchant purchases a large invoice of overcoats in the hope and belief that the winter will be long. All of these are speculators in their various ways. The miller may find the price of flour, when he comes to sell, lower than it was when he bought this wheat. The grocer may be caught with a large stock of sugar on hand when there is an unusually good crop of cane. The winter may be short, and the clothing merchant may have to sell his overcoats at a loss. They take the chances of making or losing money. The mine-owner also takes chances. He has put his money into a piece of property which may or may not develop a crop of precious metal. If it does, the chances are that his reward will be much greater than it would have been had he invested his capital in any other enterprise. The man who buys a piece of property with the intention of digging in it for gold or silver is no mere a "gambler" than the man who cultivates the soil in the hope that it will bring forth a good crop of grain. Mining is as legitimate as any other business enterprise.

HISTORICAL SOCIETY OF CALIFORNIA.—This society, at its first annual meeting, elected the following officers: President, John T. Doyle; Vice-Presidents—William Ashburner, Edward S. Holden, J. De Barth Shorb; Secretary, Bernard Moses; Treasurer, Joseph A. Donohoe; Committee on Publication—John T. Doyle, Bernard Moses, F. E. Perkins; Directors—William Ashburner, Horace Davis, Joseph Donohoe, John T. Doyle, Ralph C. Harrison, Edward S. Holden, John R. Jarboe, Bernard Moses, William Norris, J. De Barth Shorb, A. Varsi. After the election of officers, President Doyle called the meeting to order and the regular business was proceeded with. The Printing Committee reported that it had arranged with Mr. Boequet for printing the society's annuals. Treasurer Joseph A. Donohoe's report showed that the finances of the society were in a healthful condition, there being a balance of \$478.20 carried forward from last year.

THE TEREDO.—W. H. Dall, curator of the Department of Mollusks, U. S. National Museum, writes as follows to the San Francisco Chronicle: "In yours of the 23d of January is a long, and for the most part, accurate article on the teredo; this name being taken in the general sense of referring to the whole group of timber-destroying mollusks colloquially so termed. But the writer has fallen into an error which is worth correcting. The siphonal end of *teredo navalis* which he copies from Appleton's Cyclopaedia, is correctly drawn and named. The animal which hores the piles in San Francisco harbor, and which is figured in the same article, is not the *teredo navalis*, but a *xylotrypa*, probably the *x. pennatifera* of Blainville. The teredo does not have the feather-shaped processes near the siphonal end (which are called pallets by naturalists), but has an oval or spoon-shaped pair, as represented in the figure copied from the cyclopaedia."

SENDING ABROAD FOR STEEL PLATES, ETC.—The importance of the new discoveries and heavy plants for large steel products is comprehended by only a very few, even among our extensive workers in steel. The fact also that our own foundries and shops are not fully up to the demands of the times in these matters has recently been forcibly brought to the attention of the public, by the reports which come from those building the new cruisers that they cannot obtain the steel for shafts in this country. We are told that the Messrs. Crampe will have the shafts for the vessels which they are to construct made by the great English steelmaker, Whitworth, while the Union Iron Works, of this city, has been obliged to order similar work from Krupp, the German cannon-maker.

L. J. HANCHETT is the general manager of the Manhattan property for the new company. It is the intention to begin work soon in adding new improvements, and increase the capacity in the reduction of ore. Four Hamilton mills will be set up in the old Boston mill, after it has been thoroughly overhauled, and 12 concentrators, some of them Frues and one or two of the Richmond patent, will be tried. The company will discontinue the lease system and put on day's pay men to develop the mines. The old furnace of the mill will be replaced by a Howell & White furnace, with driers attached. The mill will be repaired from top to bottom.

DURING January the Drumlummon mine, Montana, ten-stamp mill crushed 456 tons of ore, yielding \$24,500; the 50-stamp mill crushed 2670 tons, \$117,500; the 60-stamp (low-grade) mill crushed 2646 tons, \$38,000; a total of 5772 tons, yielding \$180,000.

THE population of the State has increased considerably in the year 1886, between 30,000 and 40,000.

Passing Events.

The stormy weather has continued, and, on the mountains, has caused great inconvenience, delaying trains, causing accidents, and putting a stop to a great deal of outdoor work. Up in Nevada county, the accumulation of snow in some of the ditches has had the effect of shutting off water from the mines, resulting in a temporary shut-down of several properties. The miners have had to quit work.

In Montana they have had to shut down a number of mills and mines, because the railroads were unable to bring further supplies of salt. Several thousand miners are thrown out of work temporarily.

The new mines in Ventura county are attracting some attention just now, and it is expected that there will be quite a rush in that direction in the spring.

There is a decided movement among the towns in Northern and Central California to take steps to advertise the resources of their respective neighborhoods, so as to attract some of the immigrants now coming in such numbers to the southern portion of the State.

Severe shocks of earthquake have occurred in Southern Europe, and many buildings have been demolished. There has been some loss of life.

THE Santa Maria Times says: R. B. Harper, a mining expert, who has been investigating the gypsum deposits at Pt. Sal, has been engaged by a number of our citizens to make a report on the new Peru mining district.

A More than Arctic Winter!

The countries occupying the great Rocky Mountain plateau are being visited by a winter of unusual severity. It is more than Arctic, in that the excessive cold and the heavy fall of snow have been accompanied by a succession of terrific blizzards, which, causing the snow to drift badly, have added greatly to the dangers and discomforts of the situation. The winter of high latitudes, though long and cold, is still and silent. There being no strong winds, the snow never drifts badly, but lies as it falls—very deep, to be sure, but evenly distributed over the surface of the ground. But in these countries situate along and adjacent to the slopes of the great Cordillera the wind very often blows a perfect gale in the winter, moving sometimes at the rate of 60 or 70 miles per hour. With this velocity it takes up the snow bodily and hurls it into great heaps, leaving the ground in many places bare. The ravines everywhere and the deep cuts on the railroads are filled up, impeding transportation both by wagon and rail and rendering it often for weeks at a time wholly impossible. In Montana the thermometer has on different occasions during the present month ranged from 40 to 60 degrees below zero—a degree of cold, this, that, of course, severely tests the capacity of these useful instruments. The snow, where not disturbed, varies from four to eight feet in depth, being much deeper on the mountains. The obstructed condition of the roads has caused much suffering through lack of provisions and fuel. Many people have already been frozen to death, and some have died for want of food. That the number perishing from these causes will be largely increased there is reason to fear should the present cold and stormy weather hold much longer. At Butte City, Montana, the great mining center of the Territory, the mines and mills have all been closed down, being unable to obtain salt, fuel or other needed supplies. In consequence of this movement, 3500 men have been thrown out of employment.

Operations on many other mines in the Territory have for the same reason been suspended, or because the plant upon them has been buried up or carried away by snowslides, which have also in numerous instances proved destructive to human life. These avalanches, though not peculiar to these mid-continent regions, occur in the mountainous districts there with great frequency and violence, many lives being lost and much property destroyed by them every winter.

Although the snow falls to as great a depth in the Sierra Nevada of California as in the Rockies, and the former is quite as steep as the latter, still, few snowslides, none of great magnitude, ever occur in the Sierra Nevada, the heavy growth of timber there tending to check these movements of the snow. The timber on the Rockies being comparatively sparse and scrubby, is incapable of resisting the weight of the snow; hence the greater frequency and force of these movements there. As the forests on the Wasatch Range, of Utah, as well as on most of the higher mountains of Idaho and Colorado, are even more scattered and stunted than on the Rockies, snowslides there are very common. As their occurrence can be neither foreseen, prevented nor guarded against, they constitute a great drawback to the business of mining in the localities where they happen to be extensive or frequent. In California they are rarely ever attended with fatal results, and cause but little harm, the most of our mines being located in the foothills of the Sierra Nevada or elsewhere, far beyond their reach.

It is calculated that one-half of all the cattle in Montana have already been frozen or starved to death and that many more will die before the winter is over. In Colorado and Western Nebraska the destruction of stock seems to have been equally great, the terrible snowstorm that occurred in that region on the 19th inst. literally covering the cattle up. At last accounts, immense herds were to be seen with only their heads above the snow, tens of thousands of animals having already buried out of sight. Such was the force of the wind that cars, and even engines, were blown from the track. The tempest, usually confined to the mountains, on this occasion swept down upon the plains, and, tearing up the dry sand and intermixing it with the snow, drove the mingled mass along with a fury that neither man nor beast could resist. In Mon-

tsna, as also in Oregon, Washington and Idaho, there is apt to blow in the winter a warm, west wind, called the "chinook," which melts the snow so rapidly that the most of it disappears, except on the mountains, in the course of a few days. But this winter the "chinook" having delayed its coming, the snow, which in Montana commenced falling about the first of November, has since gone on steadily accumulating, till it has reached a great depth even in the valleys, from some of which it will not probably disappear for weeks to come. If winters like this are going to become the rule in these countries lying contiguous to the great continental backbone, we shall have to substitute them for Greenland in making future comparisons of cold.

Lieutenant Schwatka, he of North Pole notoriety, has, it would appear, been hibernating in Montana the present winter. Emboldened by his experience in high latitudes, this intrepid person formed the plan last autumn of going out to the Yellowstone National Park with a view to noting the winter aspect of that interesting locality, and doing perhaps a little mountain climbing by way of pastime. Alas! poor man, he had, it would seem, in preparing for this desperate undertaking, sadly miscalculated the meteorological conditions that some times obtain of a winter in this Yellowstone region—thought, presumably, that he would have to encounter there no greater cold than that in which the Icander or the Esquimaux swelter of a December night. Acting under this misapprehension the Arctic explorer provided himself, it may be supposed, with only a half dozen buffalo robes and a single bale of Mackinaw blankets. With this scanty outfit what could he do but keep close to his hotel, as the Montana editors accuse him of doing, and for the which they berate him soundly; insisting that instead of keeping within doors he should have plunged into snowdrifts and exposed himself to be buried under an avalanche or blown away by a cyclone! It is all very well for the civilian to argue that a person assigned to a service like that ought to consult duty and fame rather than safety and comfort. There, will, however, always be a difference of opinion as to how far a man should feel constrained to imperil his life for the good of science or expose himself to be converted into an icicle for the sake of glory.

For our own part, we only wonder that the man, escaping from his miserable and perilous surroundings, did not at once make his way to California, putting a thousand miles or two between himself and the scene of so many dangers and discomforts. It is, in fact, matter of astonishment that the well-to-do people of these snow-blockaded, tempest-swept countries do not all make their escape and come over here, at least once a year, and get thawed out. Commiserating their situation, we have time and again counseled them to adopt this sensible course, picturing in our poor way the mildness of our winters and the general excellence of our climate as a means of inducing them to come here and sojourn for the winter—have told them of our snowless valleys and our coast region with its perpetual spring—of this land where the blizzard is never let loose, where the lightning never strikes and little ice is ever seen except in the mountains; where, as an appreciative and poetic writer puts it, "The orange and the lemon grow to perfection and the daffodil and the lily bloom all the year round." We don't see that we can do anything more for that unfortunate people than we have done.

As for mine investors, they must see by this time that California is the country in which to embark their money in that business. The thoroughfares connecting points of supply with the principal mining districts are here never obstructed by snow. The ditches that bring water into the mines rarely ever freeze up; never do they remain frozen for more than a week or so at a time. Extensive snowslides occur but seldom, and, as before remarked, are confined to localities where they can do little or no harm. Not often have they proved destructive of property or fatal to life in California; not often have mills and hoisting works, with their occupants, been slid down the mountain-side and buried up under a hundred feet of snow, there to remain till the following spring. The expense of rebuilding these works, as also the extra wages men exact for being exposed to these accidents, are all avoided here. The many other advantages pertaining to California as a

mining country we will not at this time attempt to enumerate, the purpose of the present writing being to merely speak of those incident to our superior climate, with its freedom from hurricanes and its mild and open winters.

Legislative.

The Boiler Inspector bill has been fully discussed, but was finally so loaded down with amendments that it was referred to the Committee on Labor and Capital. It will hardly be possible to get it back on the file in time for passage this session.

The Act to protect life and property against the careless and malicious use or handling of high explosives has passed the Senate as amended. This bill practically throws the burden of protecting people on to the manufacturers and agents instead of upon the police departments.

Goucher's bill relating to trade-marks and how rights thereunder may be protected has been ordered to a third reading.

The Senate bill relating to the regulation of plumbing and drainage, and to the registration of plumbers, has been read the third time.

The Senate has passed the bill appropriating \$46,250 for the erection of new buildings at San Quentin.

In the Assembly, on Wednesday last, the bill appropriating \$60,000 for the support of the State Mining Bureau was amended, on Brierly's motion, so as to provide that at least 50 per cent of the money shall be spent for geological work in the field. An amendment by Smyth to reduce the appropriation to \$20,000 was voted down. The bill was ordered engrossed, and to the third reading. It is to be hoped it will be now passed. The institution needs support, and a pittance to simply maintain it, without giving its officers enough to work with, will be of no benefit. Some of the suggestions concerning further reduction of the appropriation were absurd.

On Wednesday, Walrath tried to have taken up his debris-impounding dam measure, but was unsuccessful.

In reporting favorably to the Assembly the bill providing for the erection of debris dams, the Committee on Water Rights and Drainage added:

We are constrained to do this from a sense that this bill proposes a feasible plan for the satisfactory settlement of a great sectional contest that has been going on for the past eight years between the valley residents along the banks of the Sacramento, Feather and Yuba and Bear rivers and the miners who dump above them in the hills and mountain canyons of the Sierras, and which contest, without any appreciable benefit to the dwellers in the valleys, has resulted only in disaster and destruction to the mining industry. An immense amount of property, aggregating in value many millions of dollars, has practically been confiscated through the application by the courts to this sectional controversy of legal principles that had their origin in another land, and under physical conditions that have no parallel in this country. Without compensation having been made, the valuable property of the miner has, in fact, been taken for private ends. The lawful industry of a lifetime has been impossible of pursuit, and the oppressed miner is at our doors asking not that he may be permitted to destroy his neighbor's property, but that some means may be devised whereby, without injury to that neighbor, he may be permitted, at his own cost and expense, to resume that occupation which stimulated the founding of this State, which has nourished its growth, and whose continuance is so essential to her future prosperity.

The bill under discussion answers, in our opinion, all these requirements, and if it can be enacted into a law, we believe that the miner may not only resume his labors without injury to his brother of the plains, but that the result of the construction of proper impounding dams will be to hold in the river channels of the mountain gorges the immense deposits of debris which have been there accumulating for over 30 years.

That the scheme of this bill is feasible, and that the mining debris may be impounded, was clearly shown to us in committee by the written testimony of such eminent engineers as Wm. Ham. Hall, L. J. Le Count, Prof. George Davidson, A. W. Von Schmidt, A. J. Bowie, Jr., Geo. F. Allard, Thos. Price, F. Van Leicht, A. Boschke, G. H. Specht, E. J. Molera, H. Jennings, Melville Atwood, George E. Gray, Milo Hoadley, J. R. Manran, Constantius Heusch, Calvin Brown, Marsden Manson, L. L. Robinson, and the publicly printed opinion of Colonel Geo. H. Mendell, Hamilton Smith, Jr., Wm. Ashburner, Gen. B. S. Alexander and Captain J. B. Eads; and therefore, believing upon the faith of such eminent authority, especially in view of the immense interests involved, that its plan is worthy of trial, we report this bill back with the recommendation that the substitute be enacted into a law.

Working Gold Ores.

A Novel Process Adopted in Calaveras County.

The property of the Willard Mining Co. in Murphys District, Calaveras county, is rather a curious one in several respects. The mine itself is worked differently from what quartz mines generally are, and the working of the ore is conducted in an unusual manner. There is a main vein and several small side veins. The ore carries absolutely no pyrites, which is found in considerable quantities in every other gold-bearing vein in that section, outside of this particular belt of veins. For a depth of 300 feet in some cases, from the surface, the vein is decomposed and disintegrated so it bears resemblance to a gravel bank, though the quartz is all sharp. This decomposition has broken the quartz up into pieces from many tons weight down to fine sand. The mine is worked by an open cut from the surface, making a funnel-shaped hole, connected by a chute with a tunnel below, through which all the material mined is run out. The tunnel is wide enough to allow a track, flume, water pipe and air pipe to run all the way in. At the end of the tunnel is a chamber, connected with the workings above by a short chute. At the bottom of this chute is a large gate; below the gate is a grizzly, and a platform and a small bin for loading into a car. The flume which runs through the tunnel comes in under the grizzly, and the water pipe connects with a small tank at the head of the flume.

With 150 to 300 pounds of low-grade powder they dislodge from 3000 to 4000 tons of material, which is thrown down to the bottom of the pit and into the chute. It is then drawn off as fast as wanted by means of the gate. As it comes through it passes on to a grizzly with bars set five inches apart. The coarser material thus screened goes on to the platform, into the bin, and thence to the car and is run out. What goes through the grizzly drops into a hopper below, from which it is fed into the flume.

The superintendent, Mr. F. B. Morse, is to be credited with devising many new plans in connection with this enterprise. As the method of working the ore is novel, we give it in his own language, reserving for another occasion a description of the works at the mine. Before commencing the description of the process for working the ore, it will be well to call the attention of mining men to the cheapness of the process; and, moreover, it will be well to note how the silver-plated amalgam plates do their work of saving gold, and how much is saved in that part of the process. No doubt a similar arrangement might be adopted at other mines with profit. An engraving is given of this plate-house, so the arrangement can be understood.

The flume under the hopper in the tunnel is 14 inches wide and 18 inches deep. It has a grade of 5 inches in 12 feet, and we run about 130 inches of water in it. This water carries all the material that comes into the flume out of the tunnel and dumps it into a dump-box.

The dump-box is a large double-compartment box, each compartment being 35 feet by 12, and 9 feet in the clear. It is provided with a large movable "tom-iron" and two hydraulic nozzles working under 90 feet pressure. The mine is worked on the day shift only, the quartz and dirt being run into one compartment of the box. The dump-box is run on the night shift, when the material that comes in by day is thoroughly washed free from clay, and is then run into another set of sluices, which convey the quartz direct to the mills.

At the mills the quartz-sand and dirty water are passed over a long grizzly of perforated screens. The quartz drops from this directly into the ore bin, and the sand and dirty water passes through the screens and is dropped into another flume. As the quartz goes into the mills it is also separated automatically as to size, the finer part going to the stamp mill and the coarser to the concentrating mill. The waste water and sand that goes through the grizzlies is taken by the flume below to what is called the "plate-house," where it is distributed over silvered plates.

We mine on week days only, running the mills every day. In every working day we mine about 300 tons of material. Of this about 10 per cent is run out on cars, and 90 per cent comes out in the flumes. This material is largely clay and sand, too fine to pay for further crushing. Three hundred tons of this dirt will produce 95 tons of milling quartz. This loose material—the sand and clay—all carries a considerable amount of fine loose gold, varying in size from the finer float gold up to particles the

size of the head of a pin—we never find any coarser than this. This gold we save in the sluices and plate-house. For this purpose we have the following arrangement of flumes, etc.: The flume from the chamber to the dump-box is 800 feet in length; grade, 5 inches in 12 feet; width, 14 inches, and is lined with block-rifles the entire way. The flume from the dump-box to the mills is 300 feet long; grade, 6 inches in 12 feet; width, 24 inches, and is also lined with block-rifles. From the mills to the plate-house the flume is 300 feet long; grade, 6 inches in 12 feet; width, 24 inches, and is lined with slat-rifles. These various flumes pick up about all the visible gold, so that the material that goes into the plate-house is apparently nothing but sand and dirty water.

In the plate-house this sand and water is divided into six equal parts, dropped into distributing boxes, and run over six aprons. These aprons are 20 feet long by nine feet wide, with a grade of five inches in the 20 feet of length. Near the lower end each apron is covered with an apron of silvered plates, nine feet square; below the silvered plates is a riffle filled with mercury, to catch loose amalgam; and below the aprons is a tank into which everything drops, to catch the loose mercury. All the water and sand is run over these aprons, each carrying about 20 inches of water. These aprons save the float gold that has escaped the sluices, and sometimes give astonishing results.

the same time have a largely increased capacity over a fine screen.

The coarse rock and all the sulphur-bearing rock goes to the concentrating mill. This mill is constructed on a different principle from most mills of the sort, as we use Tustin pulverizers instead of stamps for crushing the quartz. The ore first goes through a 12-inch Blake rock-breaker and then drops into the ore bin, from which it is fed to the Tustin pulverizers. These pulverizers are provided with automatic self-feeders, the same as we use in the stamp mill, and they feed the same way. We crush wet and amalgamated on aprons, after which the pulp is concentrated on Frue vanners.

We run four pulverizers. These run at 20 revolutions a minute, requiring 4-horse power each. We crush through a 20-mesh steel-wire screen, the capacity of each machine being from 10 to 11 tons a day on the kind of rock that comes to it. The aprons are silvered plates, 4 feet wide by 10 feet long; grade, 1 1/2 inches to the foot. We use 8 Frue vanners—2 to each pulverizer. Our coarse rock carries a very small per cent of sulphurets, from 1-16 to 1/4 of 1 per cent. The sulphurets, however, are very high grade, some being worth, when pure, upward of \$5000 a ton. We concentrate our rock up to from 82 to 88 per cent of the assay value, according to this kind and grade of the rock.

New Mines in Ventura County.

While Southern California has of late been making rapid strides in the direction of agricultural and horticultural progress, and has been building up rapidly in every way, it has also been doing something in the way of mining. A number of the camps have been enlivened by the advent of Eastern capital, and there is more mining going on in Southern California than ever before. The place which is just now attracting the most attention is the camp in Ventura county, now called "The Carbonate Camp." It is in the eastern section of the county. A new town has been laid out, called Lexington, which covers an area of 560 acres, and has been laid out in blocks and lots. The lots are selling at \$10 and \$15 now in the new town.

Following are directions how to get to the new carbonate camp of Lexington: From Buena Ventura it is distant 135 miles as follows: Fifty-five miles to Newhall, 40 miles to Elizabeth Lake, 20 miles to Gorman Station, 10 miles to J. F. Cuddy's and another 10 miles to Lexington. It is 120 miles from San Luis Obispo, 60 miles to Bakersfield, 140 miles from Santa Maria, 150 miles from Santa Barbara, 120 miles from Calico and 125 miles from Los Angeles. The nearest railway station is at Lancaster, 50 miles distant.

A number of new ledges of apparent richness have been found. The immediate necessity of the camp is a good ore-reducing plant. There are mines in the vicinity which will furnish plenty of ore. It is expected that the camp will be very lively in the spring.

Foundry Notes.

The Union Iron Works have completed large new boilers for the Pacific Mail steamship Colima. The steamer will shortly be taken off the Panama line and be thoroughly overhauled and repaired at the shipyard of the Union Iron Works.

The Government Inspector, who is to oversee the building of the cruiser Charleston at the Union Iron Works, has arrived in this city. The foundations upon which the ship is to be constructed are being laid.

The great dome for the Lick Observatory at the Union Iron Works is approaching completion.

Most of the local foundries now have some special quartz-crushing appliance which they manufacture and introduce. Of course they all make the ordinary stamp mills as well.

The Pacific Rolling Mills are employing a good many men on general work.

The Pacific Iron Works are about introducing a new boiler in the market, which has many advantageous features and has been well received in the East.

The Risdon Iron Works did a good thing when they began to introduce the Heine boiler, many of them now being in use here and giving great satisfaction.

There are more men at work in the Tombstone, A. T., mines at the present time than there has been for the past two years.

ARRANGEMENT OF PLATES FOR CATCHING GOLD AT WILLARD MINE.

We have cleaned up as high as 160 ounces of amalgam from them in a week. This gold is of the finest possible sort, and the amalgam has absolutely no grit, and is apparently almost a homogeneous mass of hardened mercury. The water, after leaving these plates, goes to waste, the plate-house being the last gold-saving apparatus we employ.

At present we are working only the main vein. A great amount of work, however, has been done on the side veins, and a number of promising bodies of high-grade ore have been developed. These side-vein ore bodies vary in length from 70 to 500 feet or more; the veins average in thickness from two to eight feet, and the walls are hard and firm. A large amount of ore has been taken from them near the surface and worked, and we are now preparing to open and work them at a depth.

We are running two mills—a stamp mill and a concentrating mill. The stamp mill is an ordinary mill of that sort. It contains 15 stamps, in 3 batteries of 5 each, with self-feeders, ore bins and plates. We work all the fine part of the quartz here, so no rock-breaker is required; and as the fine quartz carries little or no mineral, we have no concentrators here.

The stamps weigh 750 pounds each, work under a 6-inch to 8-inch drop, and drop 96 times a minute. We crush through a No. 5 slot screen, and crush 2.6 tons to the stamp in 24 hours.

We amalgamate entirely outside. For this purpose we have silver-plated aprons below the mortars, each apron being 4 feet 4 inches wide and 12 feet 6 inches long, with a grade of 1 1/2 inches to the foot. Below the aprons we have 12 feet of spout plates to catch apron, 18 inches wide by 12 feet long; grade 1/2 of an inch to the foot. The free gold in our rock, especially in the finer rock, is very fine flour gold. It is worth \$18.50 an ounce, yet an ounce of dry, hard amalgam will only retort about one-fifth gold. We have experimented with crushing through every size screen from No. 9 down to No. 4, and we find that although our gold is so very fine, yet we save the most per ton in crushing coarse through a No. 5 screen, and at

shows a marked difference in results. In crushing through the battery a large amount of slimes are produced. With the pulverizer a very small quantity of slimes is made. As a consequence, with our ore, where the rock is very hard, the gold exceedingly fine, and the sulphurets soft and brittle, we find that on the same ore we amalgamate a much greater percentage of the fine gold after the pulverizers than after the stamps; and when we come to concentrate, we can save only 18 to 20 per cent of the assay value of the ore after stamps, and 85 per cent after the pulverizers. On the same ore and with same screen our pulverizer is about the equivalent of 6 to 8 stamps, according to the character of the ore.

Our sulphurets we work ourselves, by roasting and chlorination. Our roasting works consist of two Willard furnaces, with all necessary appurtenances. These furnaces are of a ton capacity each to the charge, and we can roast, if necessary, from 6 to 8 tons a day. The chlorination works are of equal capacity, consisting of 11 pairs of leaching and settling tanks, with generators, etc. We roast the sulphurets, granulate them, and run them in a car to the chlorination works. After which, they are treated in the usual manner, and the gold leached and precipitated.

We run entirely by water-power. We use 130 inches in the mine. In the stamp mill we use, for power and amalgamation, 80 inches, under 140-foot head. In the concentrating mill we use for power, amalgamating and concentrating, 100 inches, under 160-foot head.

The cost of mining is about 50 cents per ton of quartz, delivered at mill. The average cost of milling in the two mills is about 60 cents a ton.

We employ 12 men altogether about the mine, including men in the open cut at the chamber and dump-box and carmen. In the mills we employ seven men, and at the chlorination works two men, making a total of 21 men on an average. We are now putting up compressor, etc., for power drills, and propose soon to open up various veins at a depth. The following details are of interest:

MECHANICAL PROGRESS.

Babbitt Metal.

Every mill, says *Wood-Worker*, ought to possess some rig for melting babbitt metal. In many shops the boiler furnaces is the only place available, and a 20-pound ladle the only utensil to be had. The inconvenience of this method is easily told. The ladle is shoved into the furnace as far as its four-foot handle will allow it to go, a brickbat placed under the handle, and the furnace door closed until it strikes the handle.

As the melting progresses the handle gets hot, and an attempt to remove the ladle generally spills part of the metal. In carrying this ladle with its red-hot handle, more trouble is met with, and if the workman doesn't drop the whole business because of a badly burned hand, then we may consider ourselves lucky. When a blacksmith's forge is available, the heating question is simplified, but if any welding of iron is to be done, then don't beat babbitt metal in your forge fire. A little lead in the fire, and you cannot weld until the fire is all cleaned out, either by burning salt therein, or by removing the coal altogether and substituting new.

The better way to melt babbitt metal is to get a common iron kettle, or pot, such as are used in the kitchen. The thicker the metal, the better. Set the pot on a few bricks laid in the road or the boiler-room floor, and build a fire of sticks under the pot; the whole fire need not be bigger than your hat, and half a dozen pieces of board one inch square will be enough under the pot at one time.

Keep an inch depth of ashes or dirt on top of the babbitt and very little metal will be lost by oxidation. The usual practice in melting babbitt metal, or lead, is to skim off all dross as fast as it collects, and this is a very poor method at best.

Oxygen of the atmosphere acts very fast upon melted metal, and the hotter the metal, the faster the oxygen will combine with it to form the oxide or dross.

By excluding the air, and its oxygen with it, the production of dross is completely stopped, whether accomplished by dirt on the metal, ashes, or by other means.

A very clean method is to cut out a piece of sheet iron just large enough to go in the pot easily. Let this float on the babbitt, and it will do the business thoroughly. After the metal is melted, the pot may be carried bodily to the place where babbitting is to be done. The ladle can be placed in the metal until hot, then the babbitt can be dipped up and poured when desired. By this method many a box can be saved which is lost by running short of babbitt, either through a leak around the babbitting arbor, or by not melting enough metal to begin with.

A man is pretty apt to "say his little verse" when he runs short of babbitt in filling a box; and when he must needs chip out that otherwise perfect lining, his moral standing is apt to be sadly lowered.

Twenty pounds of metal in a kettle can be more readily brought to the right temperature, and kept there, than can two or four pounds in a ladle. Pour babbitt metal too hot, and it is apt to be loose in the box, especially if the box be solid. The general rule in pouring babbitt is to beat it just hot enough so that it will brown, not burn, a clean white pine stick; but if the box be large, and is to receive a lining of considerable thickness, the metal should be poured as cold as it will run. In case of a thin lining from one-eighth to three-sixteenths of an inch, the metal will have to be poured much hotter than the above standard, or it will not fill the space. Such thin linings should be discouraged wherever possible, and no lining ought to be less than one-fourth of an inch in thickness.

ECONOMY IN STEEL MANUFACTURE.—The close competition in steel rails renders it necessary for English iron-workers to make use of every possible economy in the purchase of the raw material and in the methods of manufacture. In Wales the managers of some of the works are preparing to roll lengths of 150 feet instead of 90 feet, the longest rails made at present. This will give fine rails, and necessarily lessen the cost of production. Certain of the tin-plate makers are also aiming at economies by the purchase of steel blooms instead of buying as before tin bars exclusively. The price of blooms is somewhat under that of bars, and consumers can easily roll them down into bar form in their old forge trains.

AMERICAN STEEL is the best in the world. American steel-makers understand their business, and the metal they manipulate as well, if not better, than the steel-makers of any other country. It is but a little while since the whole world went to Pittsburg to study the best mode of manufacturing heavy ordnance and to examine into the American methods of ironwork in general. They learned some important lessons and honestly admitted the fact. America is rapidly coming to the front in every class of manufacture. Why not?

CAMPOR FOR DRILLING HARD STEEL.—A correspondent of the *Scientific American* writes to that journal as follows: Having occasion to drill through a very hard piece of steel, I tried a saturated solution of camphor (alcohol and

gum camphor), and the result was marvelous, the drill apparently "biting" its way through the steel. Thinking your readers might be profited by a knowledge of this feature in drilling, I offer this same for trial, with the hope that those using it may be as well satisfied with the results as your subscriber has been.

Nomenclature of Iron and Steel.

Pig iron is melted direct from the ore in the furnace, and contains from 3 to 5 per cent of carbon. When melted it is called "cast iron" or "metal."

Spiegel iron is precisely the same, but contains in addition from 5 to 15 per cent of manganese.

Bar iron, often called wrought iron, is pig iron which has been smelted and deprived of nearly all its carbon, either in a puddling furnace or by the Wallon, Lancashire or other analogous processes; the spongy mass or ball of iron is usually hammered or rolled into a bar.

Puddled steel is precisely the same as "bar iron," except that the process of puddling is stopped when rather more than half of the carbon has been removed from the pig iron. There are consequently no hard and fast lines between bar iron and puddled steel, the one intergrading to the other by imperceptible degrees. Although there are an infinite number of intermediate stages between the softest bar iron and the hardest puddled steel, and although it is impossible to state the exact percentage of carbon which marks the dividing line between the one and the other, it is usual to call all puddled bars which cannot be hardened in water, bar iron, and all those which can, puddled steel. This dividing line falls somewhere near a mixture containing $\frac{1}{2}$ per cent of carbon.

Blister steel is bar iron which has been converted into steel in a converting furnace, and varies in the amount of carbon which it contains from $\frac{1}{2}$ to $1\frac{1}{2}$ per cent.

Bar steel is blister steel which has been tilted or rolled down to the size required.

Cast steel is steel that has been melted in a "pot" and poured into a "mold," thus becoming an "ingot," which is afterward hammered or rolled to the size required. It may be of various "temper," varying in percentage of carbon which they contain from $\frac{1}{2}$ or less to $1\frac{1}{2}$ or more.

BOILERS AND STEAM PIPES.—STREET STEAM-PIPE EXPLOSIONS.—Are steam pipes to be regarded as boilers or "continuous boilers"? This novel question is being raised by property-owners in New York City, who are fighting the New York Steam Company, as to whether the big steam pipes in Broadway and elsewhere are not virtually boilers, and as such should be inspected by the police department. The boilers of the company are located on Greenwich street, and, of course, have been duly inspected. The pipes have not been examined, however, as it is a question which only the courts can decide, whether the steam pipes should be regarded as continuous boilers. There is certainly a steam pressure in them. It is stated that 264 explosions have occurred in the pipes, and that three lives have been lost. The company attributes the explosions to the accumulation of illuminating gases. The decision of this question is looked forward to with considerable interest.

TEMPERING STEEL.—When we were much younger than we are now, says a correspondent of the *Boston Journal of Commerce*, and the clearing on top of our head hadn't acquired such beautiful proportions, we had to temper up a lot—yes, verily, many lots—of steel tools, and here's the "great secret" we used: We got a "slush bucket" and washed it out clean, then weighed out one ounce corrosive sublimate, put in two handfuls common salt and stirred it up with two gallons rain-water, heated the tools in hot lead, and hardened in this liquid and drew over a charcoal fire. A tool never broke.

WELDING BY ELECTRICITY promises to become a more useful discovery than was at first supposed possible. It is well known that by the ordinary method of heating and hammering, only soft iron, steel and a few other metals have been welded; but by the use of electricity not only have cast iron, brass, gun metal, bronze, German silver, zinc, tin, lead, and many other metals been welded like to like, but it has been found in many cases very easy to unite unlike metals. Small pieces, too, which were formerly difficult to weld on account of rapid cooling, are easily dealt with by the new process.

STEEL SHEETS FOR GALVANIZING.—The galvanizers are experimenting with steel sheets in place of iron, but they are met with the difficulty that all qualities of steel are not equally applicable to the process. It has not yet been ascertained what thickness steel sheets will take to give coating, and it is still a matter of question as to whether the cause of variability is to be found in the difference of composition or of surface.

IMPROVED ORDNANCE.—Thomas Jessup & Sons, of Sheffield, it is said, have devised a new gun so constructed as to prevent erosion. The matter is attracting considerable attention in government circles. But one gun has thus far been constructed, with which the government is experimenting. Should the Admiralty report favorably upon it, the gun will be immediately manufactured in large numbers.

SCIENTIFIC PROGRESS.

Sources of Power.

In the older treatises on mechanics, we find the sources of power classified under the heads "Wind," "Water," "Steam," "Animals," and, broadly speaking, these are still the only sources of power we possess. But when we deal more in detail with the subject, we find that wind, in all probability, owes its capacity for performing work to the sun, while water is absolutely inert save as actuated by gravity, and steam is, of course, merely an agent by which heat is converted into work. Concerning the methods by which animals perform work, we are entirely ignorant, no physiologist having as yet succeeded in tracing the sequence of processes by which food is converted into mechanical energy. Enough is known, however, to show that the process has nothing in common with that by which work is performed by heat engines. So that the analogy sometimes drawn between a man and a machine must be rejected as far-fetched, permissible to the poet, indeed, but not to the philosopher. Furthermore, it is known that the work got out of food by men and animals is much greater on the whole than can be obtained from fuel consumed in the best steam engines. That is to say, a man or a horse may be more economical sources of energy, in one sense, than any machine. As this as it may, it is sufficiently evident that we depend for the performance of all the work done in the world on two main sources of power—heat and vital energy. The action of gravity, it is true, causes the falling of water, and so gives out power; but the water has to be raised before it can fall, and this raising is effected by the heat of the sun.

It appears to be not unreasonable that men should ask themselves, now and then, if there are no other sources from which power may be derived—is there no other force of nature that can be made the slave of man? The question has been put in hundreds of ways, and remains unanswered. The seekers after motive power have been nearly as numerous and persistent as those who wasted their lives in search of the philosopher's stone. With the "perpetual-motion" man we have no patience, and it is, perhaps, scarcely necessary to point out to our readers that we are about to speak of something very different indeed from the ordinary notion of perpetual motion. Inventors who have sought that, have for the most part attempted to get something out of nothing—that is, in a word, create energy. There is a wide difference, however—a great gulf, indeed—between this and an attempt to still further explore nature's secrets in search of a source of energy—that is to say, of work—now unavailable. Now, in dealing with this question of sources of energy, it seems to be not impossible that a misapprehension of the nature and bearing of the laws of the conservation of energy may do a great deal of harm.

It may be said, for example, that it is quite useless to search for a source of energy which can be better or more economical than what we have now, and much more to the same effect. But let us ask ourselves what is this law of the conservation of energy, on what is it based, and what would be the consequences to the universe if it did not exist? Such questions are very seldom asked, because the number of men who are at the pains to think for themselves is small; but when they are asked, the answer is remarkable. There is really no reason at all why energy should be conserved, and so far as our senses supply evidence, far from being conserved it is being profusely wasted every day. Of course, if we go a little behind the evidence of our senses, we find that the waste is only apparent, not real. It is much easier, however, to form an idea of a universe in which the law of the conservation of energy has no existence, than it is to realize a fourth dimension in space, or even the life of the inhabitants of Flatland. As a help to the realization of such a universe, we may point to the fact that the sun has been giving out energy for millions of years, and that there is no reason to think that he has lost any portion of his original heat. In other words, it is simply impossible to prove that what we call energy is not created in the sun. Again, let us take gravity. We have here the most stupendous force in nature. There is no reason to imagine that it is capable of degradation. If all the planets fell into the sun, gravity would of necessity have performed an enormous amount of work; but no one can say that after it was done gravity would be any the weaker. It may, indeed, be said that the law of the conservation of energy has only just missed being disproved, if the words "conservation of energy" be used in one sense. So far as can be seen there is no reason why the line of magnetic force should not behave like lines of electrical force or heat force, and admit of being intercepted or stopped. It would then suffice to put a permanent magnet under one end of the beam, the other end of which should be connected in the usual way with a crank and fly-wheel. Then, by interposing and withdrawing a thin intercepting plate at the proper intervals, we should have a machine which would work steadily until it was worn out, without the expenditure of one farthing for fuel. In the popular sense of the word, we should create power; and the perpetual-motion men would spend their lives in patenting details, while the principle would be public property.—*Selected.*

Dry Rot in Timber.

In a recent number of a German technical paper, Herr Gottstater treats of the question of dry rot by the light of a summary of known facts illustrative of the subject. He is of opinion that this problem is still to be solved; and, in view of the occurrences of dry rot under some very peculiar conditions, suggests that the germs of the disease may exist in the living tree. In no other way can he explain the decay of wood from this cause when it was apparently dry and sound and properly used. In Russia there are entire forests from which no timber is now taken, experience having shown that it has always been attacked by dry rot. Sometimes a strong solution of common salt, applied while hot, has been found an efficient preservative of timber. The necessity of airing timber in its built-in position is, of course, universally recognized. Professor Farsky, of Tarbor, Bohemia, has found that salicylic acid is a preventives and cure for dry rot. At first the acid was used in a dry form, but latterly great success has been achieved with a solution of 5.28 ounces of salicylic acid in 0.22 gallon of alcohol, and afterward diluted. This solution has efficiently protected a floor 800 square feet in area from the spread of dry rot, and has removed it from the spots where it seemed to have established itself. The crude acid may be used for this purpose, and its action as an antiseptic is heightened by the admixture of a little carbolic acid. Professor Poleck finds that wood cut in winter and not soaked in water is very susceptible to dry rot, which does not appear when the timber is kept perfectly dry or thoroughly wet. A somewhat high temperature and dampness are almost, though not entirely, essential to the propagation of the dry-rot mycelia. It is in contemplation to determine by experiment whether timber cut in summer cannot be rendered safe against dry rot by the removal of the bark, protracted drying and prolonged steeping in water.

THE POWER OF STEAM.—IMPORTANT BUT DANGEROUS EXPERIMENTS.—The early experiments for the purpose of measuring the force of vapor of water were very important and dangerous. In the early days of the use of steam it was very important that such experiments should be made, because the safe working of steam engines was dependent upon correct measurements of the force, and because all the properties of heat had to be passed in review; and dangerous, because they "imposed the task of confronting the unknown caprices of a formidable force. There were but two men," says *Science*, "to accept it and conduct it to success—Arago, who never shrank from a duty; and Dulong, already maimed by an explosion, whose previous studies had admirably prepared him for the new work." A rude monometer was extemporized, and a boiler, far less staunch than the steam boilers of to-day, was set up, in which water was heated until the water was 27 atmospheres. "They could go no further. At this extreme point it leaked at all the joints, and the steam escaped through the fissures with a hissing that was of bad omen. But the observers, though aware of the danger, silent and resigned, finished without accident the measurements which they had begun." Telling M. Jamin's story, which was written out as above from his dictation, Arago said: "Only one being of our company preserved his serenity and slept quietly; it was Dulong's dog; they called him Omicron."

A SUBMARINE CRATER.—Recent observations are said to indicate the existence of a submarine volcanic crater between the Canary Islands and the coast of Portugal. From a cable-laying steamer in 39° 25' north, 9° 54' west, the water was found to measure 1300 fathoms under the bow and 800 fathoms under the stern, showing the ship to be over the edge of a deep depression in the ocean bottom. It is well known that great inequalities are found in the bed of the Sea of Lisbon, and these are thought to be due to a submarine chain of mountains.

BLASTING WITHOUT EXPLOSIVES.—A new method has been recently introduced by Dr. Kosman, and is described in the 87th volume of the *Institution of Civil Engineers*, page 41. Zinc powder and sulphuric acid are contained in a glass cartridge, by breaking which the two substances are brought into contact and hydrogen is rapidly evolved. A pressure of about 37,000 atmospheres is obtained, although, perhaps, with hardly sufficient rapidity to justify the use of the term "explosion."

A NEW MODE OF LIGHTING.—A new mode of lighting is on trial at the Marlborough rooms, and the experiment seems to be successful. A small gas flame has an ordinary lamp-glass over it, and over this is suspended a small muslin skirt, impregnated with incombustible oxides. The gas flame lays hold of these, and the result is an enormous increase of the illuminating power of the flame. The light is white and smokeless.

NATURAL GAS.—It is said that practical experiments made by good gas engineers have proven that natural gas cannot be conveyed in pipes over 35 miles. If such is the case, cities and towns at a much greater distance than that from its natural sources cannot hope to benefit by the discovery of this cheap and wonderful natural product. The city and works must go to the gas, for the gas cannot come to the city.

ENGINEERING NOTES.

CONNECTING THE GREAT LAKES WITH THE MISSISSIPPI.—The project for a steamboat connection as above has long been under consideration by engineers and by Congress. The trouble seems to be to select some one of the several routes proposed. Reference to the various routes is made in the following extract from an Illinois journal, which evidently favors the Hennepin canal: "The Board of Army Engineers, appointed under the provisions of the last River and Harbor bill to examine into the feasibility of the work, finds that the proposed canal is feasible, and because of its commercial importance is worthy to be undertaken by the General Government. But it recommends the non-acceptance by the United States of the Illinois canal under the provisions of the existing act of the Illinois Legislature. This means that a recession would be necessary by the people of Illinois, and this would take the subject out of Congress for the next three or four years. The board also, by its indorsement of the Marais d'Osier or northern route, as against the Rock Island or southern route, puts a damper on many friends of Hennepin. Most of the engineers who have made surveys have favored the Marais d'Osier route, but Gen. John Newton, when at the head of the Engineer Corps, always overruled his subordinate and upheld the Rock Island route because of its superior commercial advantages. But he is no longer with the department, and the Marais d'Osier people have their own way. The Hennepin canal scheme is not dead; it will live again, and we believe, will at no very remote day become an actual realization."

A GIANTIC PROJECT—THE FUTURE OF WESTERN ASIA.—The French have started another canal idea that throws the Suez and Panama quite into the shade. The project is due to M. Ende, who proposes to cut a canal through Syria and Persia, and thereby unite the Mediterranean with the Persian Gulf. A portion of the Orontea would be canalized. Syria, Persia, and the Asiatic provinces directly to the east of Persia are evidently destined to become areas of large and industrious populations. Industries will be rapidly introduced there as soon as Europeans gain a sufficiently secure foothold to crush out the present effete governments. The principal hindrance to such a movement just now is the difficulties involved in properly parceling out the region among the various European governments. Russia is evidently intent on securing the lion's share, and she will get it. This was in all probability the early oracle of the human race, and probably it will be about the last to come under subjection to modern industrial rule. When it reaches such a destiny, it will prove the garden of the world.

THE PERECOP CANAL.—Russia seems to be very active in her various internal improvement schemes—especially along her eastern European frontier; evidently having an idea of the possible early need of such improvements for war purposes. Late accounts are to the effect that the Government has concluded an arrangement with the firm of H. Hersent & Co., of Paris, for the raising of a sum of 25,000,000 roubles, gold, in order to construct the Perecop canal, in the Crimea. The canal will establish a direct route between the Don, the Black sea and the Sea of Azof, and three lines of rail, namely, the Kiossoff-Voronej, the Kursk-Charkoff, Azof, Don or Mariopol line, and the Losoff-Sebastopol, Charkoff-Nicolaieff line will be brought into junction with it. The strategical importance of the canal will be considerable, but it will also enable the Russians to bring the coal and coke of the Don collieries to the Black sea ports and undersell the English coal, which at present enjoys almost a monopoly in those ports and at Constantinople.

MORE ELEVATED RAILROADS FOR NEW YORK.—Mr. Field proposes to girdle the city of New York with elevated railroads, thus connecting the river front on either side with the Battery. To complete the system he would induce the ferry companies to add an upper deck to their boats, so that the passengers may be transferred without touching the pavements. All the railway companies controlling ferries favor the project. The new cable road in 125th street sends the cars through noiselessly at the rate of eight miles an hour, and officers of the Third-Avenue railroad are so favorably impressed that the adoption of the cable system on this road is probable. The road connects at Tenth avenue with the section that runs to High Bridge. The electric motor for Third Avenue is pronounced entirely practicable.

THE RECENT RAILWAY-BRAKE TESTS.—One of the interesting subjects touched upon during the recent railway-brake tests at Burlington, Ia., was the question of the value of slack in coupling cars as a help in starting, the use of loose coupling, of course, allowing the engine to start each car separately in rapid succession. The results of the experiment, however, were not in favor of this, though they showed the beneficial effect of some slight elasticity in the coupling.

A NEW INCANDESCENT LAMP.—An incandescent lamp which requires no vacuum in the globe is said to have been invented in Germany. The wire used is a mixture of conducting and non-conducting elements, the latter preventing the former from melting.

USEFUL INFORMATION.

A New Method of Cleaning Stonework.

It is sometimes required to clean the surface of old masonry that has become weathered or coated by deposits from dirty water, either for the sake of appearance or to make a sound connection with new work. The only effectual method hitherto practiced has been by completely redressing the surface with the chisel—a tedious and costly method. A different and, it is claimed, a more satisfactory process, has been devised by M. De Leilhhabert, which was recently used for cleaning the walls of the quays at Paris. These walls in a few years become covered with a shiny, black deposit, which resists acids. To remove it, a paste composed of a solution of soda and lime, to which a little chloride of lime is added, was mixed to the consistency of honey and spread over the surface, where it was allowed to remain for two or three hours, according to the condition of the stone. When it was removed the deposit was still black; but it had become sensitive to acids. After this preliminary treatment a workman passed over the surface (with a large gutta-percha brush) a mixture called sulphochlorhydric, forming on the stone a kind of glue; and almost immediately afterward he syringed the surface with a jet of the same liquid. It formed an adherent paste, continuing to act upon the stone for about two or three hours. After the syringing came a gang of men who scrubbed the surface, finishing off with a hose-pipe. The sulphochlorhydric mixture is composed of sulphuric and hydrochloric acids mixed empirically according to the nature of the stone and the necessities of the case. The cost of cleaning stone walls by this method in Paris is .46 franc per square meter for material and .50 franc for labor, by contract. The preliminary treatment by the caustic paste was paid for separately at .50 franc per square meter. It is said that the stone itself is not damaged by this treatment, and soon regains its natural color.

HOW THE RUBBER ROLLS ARE FASTENED ON THE CLOTHES-WRINGER.—First, clean the shaft thoroughly between the shoulders or washers, where the rubber goes on. 2. Give the shaft a coat of copal varnish between the shoulders, and let it dry. 3. Give shaft coat of varnish, and wind shaft tightly as possible with five-ply jute twine at once, while varnish is green, and let it dry for about six hours. 4. Give shaft over the twine a coat of rubber cement, and let it dry for about six hours. 5. Give shaft over the twine a second coat of rubber cement, and let it dry for about six hours. 6. Remove washer on the short end of shaft, also the cog-wheel, if the shaft has cogs on both ends. 7. See that the rubber rolls are always longer than the space between the washers where the rubber goes on, as they shrink or take up a little in putting on the shaft. 8. Clean out the hole or inside of roll with benzine, using a small brush or swab. 9. Put the thimble or pointer on the end of shaft that the washer has been removed from, and give shaft over the twine and thimble another coat of cement, and stand same upright in a vise. 10. Give the inside or hole of roll a coat of cement with a small rod or stick. 11. Pull or force the roll on the shaft as quickly as possible with a jerk, then rivet the washer on with a cold chisel. 12. Let roll stand and get dry for two or three days before using same. Cement for use should be so thick that it will run freely; if it gets too thick, thin it with benzine or naphtha.

RESTORING PLUSH.—It is customary to use ammonia for the purpose of neutralizing acids that have accidentally or otherwise destroyed the color of fabrics. This must be applied immediately or the color is usually imperfectly restored. After careful use an application of chloroform will bring out the colors as bright as ever. Plush goods and all articles dyed with aniline colors, faded from exposure to light, will look as bright as ever after sponging with chloroform. The commercial chloroform will answer the purpose just as well. This chloroform will be found very useful, as chloroform, which is quite cheap, readily restores the color of faded plush garments.

HOW TO BRIGHTEN PICTURE FRAMES.—Picture frames will often look as though they needed regilding, when all that is necessary to improve their appearance is, to apply with a soft brush a mixture of white of eggs, two ounces, and one ounce of chloride. King's yellow and Indian yellow, if shadowed with burnt amber and gamboge, produce a very good imitation of gilt. Defaced gilding, if the result of the dust adhering to the surface, will look bright and new by being coated with wet fuller's earth, and on this drying it should receive a coating of ox-gall with a sponge.

WOODEN BOLTS in house-building, and their superiority over nails, is thus commented upon by an English journal: "Why do you make so lavish a use of nails in the carpenter work of our houses, to the exclusion of the honest, old oaken pin? Pull down any building, if it be merely a barn, more than 200 years old, and you will not find a single nail in the original work; rafters and joints were all bolted together so stoutly as almost to defy the tools of the destroyer. Many an old manor barn,

when pulled down of late years—as, unfortunately, only too many of them are—has shown itself to have been better built than most palaces are now. There are arguments in the way of economy of time, and an on, in favor of the use of nails in house-building; but they are as nothing compared with the solid advantages of using wooden bolts. The iron nails in time canker and rot rafters and floors, but wooden bolts hold them together 'like grim death,' and render a house practically indestructible."

OILING CYLINDERS.—Two cylinders have recently come under the notice of the Boston *Journal of Commerce*, one which had run 18 years and another 15 years, the first without any lubrication and the second with only a little attention in this respect once a week. Both cylinders were polished like a mirror and neither was appreciably out of true. The condition of these cylinders after so long a run leads one to question the necessity or advisability of pouring so much oil through engines as is frequently, it may almost be said, usually done. It appears that a cylinder can be so made and the piston so packed as to run without it, without especial injury to itself in a long term of years, but it is probable that the diminution of friction which would accrue from the use of oil would more than balance the expense and troubles of its use. There is no doubt, however, that there is an immense amount of oil used needlessly in this way, and it appears to be the very general testimony of those who have tried it that a cylinder which has run well without lubrication, if once oiled will always require it.

TO KEEP LEMONS.—Lemons are a very cheap luxury for those living near cities, or having easy access to rapid transportation, and can be kept fresh for months by putting them into a clean-tight jar or cask, and covering them with cold water. Keep in a cool place out of reach of sunlight, and change the water often—not less than every third day, every second day is better. Lemons are excellent for winter use, or if one is bilious or inclined to rheumatism.

IVORY MAY BE CLEANED by scrubbing with a new soft tooth-brush, soap and tepid water, then dry the ivory and brush well, dip the latter in alcohol and polish the ivory until it has regained its former sheen. If the water gives the ivory a yellowish tint, dry the object in a heated place. If age has yellowed it, place the object under a bell-jar with a small vessel containing lime and muriatic acid; and set the whole in the sunshine.

TO KEEP postage stamps in the pocket or memorandum book without sticking, a New Orleans postoffice clerk advises people to rub the sticky side over the hair two or three times. The oil of the hair coats the mucilage and prevents it from sticking.

You can make your own "gas fitters'" cement thusly: Melt up $4\frac{1}{2}$ pounds rosin, 1 pound beeswax, and stir in 3 pounds Venetian red; it will hold gas in.

GOOD HEALTH.

Diet for the Aged.

Dr. H. C. Wood, in the *Annals of Hygiene*, gives the following: The teeth in old age are, of course, lost, and they should, unless under exceptional circumstances, be replaced by artificial teeth, for the thorough chewing of food is even more necessary in the old than in the young, because in the old the digestive powers are apt to fail. With the best artificial teeth mastication is apt to be imperfectly performed, hence the food of the aged should be soft and readily comminuted, and especially should it be of easy digestion. Very few old people need stimulating diet; very many are injured by an excess of nitrogenous food. The kidneys, like all other organs, are feeble, and if meats and other rich foods are used in excess, they greatly increase the strain upon these organs. Milk and milk products, or preparations of bread-stuffs cooked with milk, should form a large proportion of the food of the ordinary aged person, but individual peculiarities differ so much that personal medical counsel should in all cases be taken, so that the diet may be regulated to the needs of the individual case. Very many old people are hurt by the use of food in excessive quantity; but little exercise can be taken, all growth has ceased, and the bodily furnace which makes heat are able to destroy but very little of food fuel.

Some little time since I had occasion to lecture on this subject at the Philadelphia hospital, and an assertion that I then made that most old people are more comfortable, enjoy better health, and probably live longer for the use of wine, has met with very severe disapprobation at the hands of some of the profession, whose strong sympathy with the temperance movement dominates their judgment. No valid reasons have, however, so far as my judgment goes, been brought forward to lead me to change my opinion. In the overfed American people the habitual use of wine during youthful or middle age and vigorous health, we think, an injury rather than a good; but when the powers of life are failing, when digestion is weak, and the multitudinous small ills of feebleness perplex and annoy, one or two glasses of generous wine at dinner aid digestion, quiet for the

time being much nervous irritation, and in no way do harm. The sum total of ruin wrought by alcohol in the world is appalling, but it is not lessened by shutting our eyes to the good that wine, properly used, may achieve. When in the aged there is a distinct failure of vital power, and especially of digestive power, the call for the habitual use of alcoholic liquors is, in my opinion, imperative. The danger of the formation of any evil habits when a man has crossed the line of 70 is so slight that the most conscientious physician need not hesitate in recommending the daily use of alcoholic beverages to his patient.

A Cure For Consumption.

A novel method of treating patients suffering from phthisis is described in a recent number of the *Medical Record*. It was devised by a French physician, Dr. Bergson, of Lyons, who has been applying it for two years to cases of chronic pulmonary and throat disease. The results are said to be remarkable. In acute general phthisis there has been an arrest of the progress of the disease and a cure in a few months. In advanced consumption marked improvement of symptoms is rapidly secured, night-sweats ceasing and the cough becoming less harassing. Two hundred cases have been treated with singular success by Dr. Bergson in Lyons, where the climate is unfavorable for consumptives. His method has been introduced in the hospitals there and in Paris, and the medical authorities are favorably impressed with it.

The treatment consists of daily injections by means of medicated gases. Carbonic acid gas when introduced into the system by this method is found to be painless and harmless. Sulphurated hydrogen is mingled with it, the entire structure of the lungs is permeated by the medicated gas, and remarkable curative effects are observed. The carbonic acid gas is practically inert when taken up by the veins of the intestines, but the sulphurous gas reaches every particle of diseased tissue in the lungs and throat, which is eliminated from the system in the process of expiration. The volume of gas used is very large. At the outset a single litre is introduced, but the quantity is rapidly increased to 10 or 12 litres for each injection.

The results of this new system of treating consumption are so well vouched for that we commend the subject to the critical examination of medical circles in this country. Consumption is the chief scourge of the Atlantic seaboard. Any departure in therapeutics so radical as this French method deserves to be thoroughly investigated and adequately tested in American hospitals. Dr. Bergson is not a scientist, but a reputable physician of large practice and good standing. If his method be as effective and successful as he asserts, it merits general attention from the profession in the United States.—*New York Tribune*.

VINEGAR AND INDIGESTION.—It is the business of the saliva to digest starch, and by its alkalinity to stimulate the secretion of the gastric juice in the stomach. It is well known that the saliva is unable to act upon starch in the presence of an acid. Experiments have shown that even so small a quantity of vinegar as one part in 5000 appreciably diminishes the action of saliva upon starch. One part in 1000 renders it very slow, and twice the latter quantity arrests it altogether. From this it is evident that vinegar, pickles, salads, and other preparations in which vinegar is used, are unwholesome, especially when taken with farinaceous food, such as bread and other grain preparations. There is a popular notion that by the use of vinegar a tendency to increase in flesh may be antagonized. The physiological fact that fat is largely formed from the starchy elements of grain and vegetables, rather supports the popular notion; but this method of reducing weight should not be encouraged, as the loss of flesh is secured at the expense of good digestion.—*Good Health*.

PIMPLES.—Hearty eaters are more subject to pimples, especially on the face, than those who are somewhat abstemious in their diet. Persons who are troubled with pimples should eat simply to satisfy the wants of the body, but avoid anything like gluttony. Select good food and put aside articles that will disturb or retard digestion. Greasy, oily substances, an excess of sugar or butter, and coffee or tea have a tendency to interfere with the action of the stomach and intestines, and clog the blood with matter that cannot be disposed of readily by excretory apparatus. Keep the skin clean, too, by frequent bathing. For the removal of pimples, there is nothing better than a solution of salicylate of soda—a teaspoonful of the powder dissolved in a three-ounce vial of water. Use as a lotion; it is the best preparation to secure a beautiful, healthy skin which can be used, and the cheapest.

A CURIOUS AFFECTION.—The Berlin Medical Society has received a report by Mons. Lawin, describing an affection that seems to be peculiar to workers in silver. It appears in the form of round or oval spots of a bluish hue on the skin, which may reach the size of a five-cent nickel. They are generally on the back of the left hand, and can only be accounted for by supposing that the silver in solution falls upon scratches, where the body fluids give rise to some chemical change producing the peculiar color.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. *Amador Ledger*, Feb. 19: The pipe for the Wildman is all completed except tarring. The iron work for the hoisting works is being placed on the ground very fast, and the building over the hoisting works is nearly finished. The Mahoney mine is running to its full capacity. It takes only a dozen men to run the whole business at mine and mill. J. Lyzinsky and Mr. Callaghan are up from the city, looking after matters pertaining to the Mahoney.

NEW SUPERINTENDENT.—*Amador Ledger*, Feb. 12: Mr. Dolan has been sent up from San Francisco to take charge of the Gold Mountain mine, at Quartz mountain, in place of Mr. Jackson, the former superintendent. The mill is running steadily, and all who are acquainted with the property express the utmost confidence in its paying character, if wisely handled. Mr. Graham, one of the bondholders, is still on the ground. M. M. Culbert's new ten-stamp mill at Lower Rancheria has started up since the late heavy rains set in. The machinery for the new mill to be erected on the Goodman mine, at Quartz mountain, has been ordered from San Francisco.

Butte.

SPRING VALLEY.—*Oroville Mercury*, Feb. 16: Superintendent Glass of the Spring Valley mine was in town this morning, and when asked if there were any further developments of the legal status of the company, informed us that the Bank of California and the company have agreed that the mine shall resume operations under the present management, and that the laborers at the mine shall have all the profits until their claims have been liquidated. This means simply that the financial difficulty has been obviated, and that the old Spring Valley mine will go on washing out gold as heretofore. We are glad to know that all is well with the mine again.

Calaveras.

MURPHYS.—*Calaveras Prospect*, Feb. 19: In this vicinity mines and mining were never in a healthier condition. The Oro Plata pulverizers are running on ore stoped with the Burleighs from the Red Wing. Its 15-stamp mill is at present shut down, on account of the difficulty and danger attending working in the big pit from which the ore is extracted. This danger will be over as soon as fair weather sets in. Lem Johnson and John Canyon are working the Collier mine in Collierville, and are taking out ore that mills \$600 per ton. This vicinity invites the prospector. The old Taylor mine, a few miles distant from this place, is being worked by James and Hiram Taylor. Some five years ago a five-stamp mill was erected on this property, and rich rock taken from the top of the lode. The present owners are running a tunnel to tap the lode at a considerable depth. They are now in 150 feet and expect to strike the lode 20 feet further on.

El Dorado.

AT NEWTOWN.—Cor. *Placerville Republican*, Feb. 19: The mines here in early days were very rich, and we believe there are places yet when thoroughly prospected that will develop into paying claims. A company from San Francisco has recently commenced a tunnel on Mr. Snow's place, which, when completed, will open a channel which there is every reason to believe is rich. There are quite a number of tunnel claims that are worked summer and winter. The most noticeable of these is one owned by V. Tachino and J. Gardella, being run to the distance of 600 feet, on the north side of what is known as the Newtown Hill. Also one adjoining owned by G. Paginini. C. P. Steadman & Son own a ditch supplied with water from the south branch of Webber creek, and which furnishes water for irrigation and mining purposes. They also own a hydraulic claim which has been successfully worked for several winters. Quartz mining has not received as much attention here as it should have. There are several ledges in which gold has been found, but they have never been opened. There was a mill put on the ledge known as the Utah, a few years ago, and run for a short time, but owing to bad management, it was closed down. The mill stands, and we hope and believe the mine will some time be thoroughly tested and prove good.

Fresno.

HILDRETH MINES.—*Fine Gold Miner*, Feb. 18: Russ Fleming has located a fine prospect. The ledge is well defined and of good milling quality; the surface croppings assay \$30 per ton; the selvedge upon the foot and hanging walls are talc, porphyry and some loose quartz, that by pan test (20 pounds of dirt) prospects \$45 to the pan. In the vicinity of Fleming's find are four or five valuable ledges owned by Fresno and Hildreth mining men. Undoubtedly from the amount of gold in quartz float in that section other ledges will be found that will be equally as good as Fleming's. The Morrow mine is showing up well. Since Jesse's return from Fresno city he has put a force of men to work in the upper tunnel, and from the prospects obtained of the last two or three tons it is thought that they have got into another "pay chute" of ore, although the ore is no better than the lower tunnel contains. The ore dump is increasing, and we understand that Jesse will lease the Hanover mill shortly. From the favorable condition for working the ledge and the amount of ore in sight they can keep the mill running day and night for the next six months. The Taylor and Fraser mine is improving wonderfully upon development. While sinking a working shaft upon four feet of ledge matter that prospects \$30 per ton, what was supposed to be the footwall upon drilling through turned out to be the hanging-wall of the ledge proper, showing 3½ feet of fine milling quartz that assays \$70 per ton—making in all (ledge matter on the hanging-wall and quartz) nearly 7½ feet. The people around are quite jubilant over the new discovery. The Fresno mine, owned by Messrs Hitchcock, Keith and Bird, is looking fine and without a doubt is the making of a good mine in the future upon proper development being made. Since writing of the Zoller and Johnson prospect in the last issue, a rich pay chute has been opened up, and upon visiting and examining the ledge we find that the report

was not exaggerated. Like the majority of ledges in the district, it is small, being 1¼ feet between the walls but very rich; the smaller the vein the richer the ore is in coarse gold. Below water level the sulphurets in this mineral belt average between \$275 and \$600 per ton. On account of this late discovery the surface ground for half a mile has been located for extensions. Fred. Nobleck is one of the lucky owners of the Rough and Ready mine, and we understand that he has also bonded ¼ more from Capt. J. T. Young for \$3000. The development of this property is a 100-foot shaft, or rather incline, from the bottom of which a crosscut and drift has been opened up that is about 45 feet in length. This was done in order to find the pay chute. The entire development is on a two-foot ledge that mills \$85 per ton coarse gold. The sulphurets are worth \$600 per ton. The Cascade mine, the mother lode of the district, is coming to the front in great shape since F. C. Sculley, of San Francisco, has taken an interest in the property. In drifting in the tunnel, a fine ledge was opened up that is very rich. The tunnel will drain the working shaft 120 feet. The Baker Bros. are also owners in this property, and state that a mill will either be put on the Cascade or Rough and Ready this coming summer. Norman Jennings' new discovery and location is another rich surface prospect which only remains to be opened up and developed to ascertain its true value. Such rich croppings do not, as a general rule, continue in this section 75 feet before running into sulphurets three parts, and one part coarse gold. The specimens we broke off the apex will, undoubtedly, assay \$10,000 per ton. The ledge three feet below the surface, between walls, is 12 inches with another foot of ledge matter that prospects 50 cents to the pan. The James & Francis Mining Co. is sinking and drifting on its rich ore body, and at the present rate it will not take long to sink 200 feet deeper. The ledge is strong, the hanging-wall being a micaceous sandstone and porphyry, and the footwall talc. The Patterson ledge is the extension of the Wilson mine, and judging from the ore on the dump lately brought to the surface when examining the lode, the Patterson is a good mining proposition. The ledge is two feet between walls, one foot of the vein being very rich. On account of developing another location nothing was done in the Louis Wilson mine, except astraining four tons of the ore which netted \$70 per ton. Mr. Wilson has also contributed a fine large specimen for exhibition at Los Angeles. The Dahlonega quartz mine, owned by Geo. W. Grayson, Jr., Morris Gladdis and Nicholson, is, in fact, the real "blue streak" mine, and at its present depth, and on account of the valuable ledges which surround it, makes it worth fully \$25,000. The ledge proper is two feet of solid quartz that mills \$40 a ton with sulphurets that assay \$350 per ton, while the three feet of ledge matter on the hanging-wall mills \$25 a ton. The owners are sinking, but from the flow of water in the pump will soon have to put in a pump. A 20-stamp custom mill in this district would be kept busy all the year round.

Nevada.

COLUMBIA HILL.—Cor. *Nevada Transcript*, Feb. 19: In the *Transcript* of February 12th, we saw a few brief notes upon the quartz interest of this section, but they gave a very faint idea of the extent of this quartz belt. Of course the Delhi and Grant quartz mines head the list, as they are permanent mines of intrinsic value, and will sooner or later boom the whole network of gold-bearing quartz veins extending along the Middle Yuba river from the Grant mine to the McKillohan mine, a distance of 25 or 30 miles. Already many trees between these two points are adorned with location notices. Many of these locations have but an imaginary value, but those on Grizzly ridge, from which good prospects have already been obtained, come in the following order: First comes the Grant, then come the Sip, the Gardner, the Egyptian King, the Egyptian Queen, the Old Bucklin, the Southern Extension of the Delhi, the Delhi (already a dividend-paying mine), the Last Chance, the Kampfer and the Josephine. This part of Nevada county affords an opportunity for the quartz miner and also an opportunity for the farmer.

WATER.—*Nevada Transcript*, Feb. 22: A good head of water is running in the Snow mountain ditch, and all the mines on Deer creek just below this city have an abundant supply. They are running regularly as usual with the exception of the Wyoming, where everything is ready to start up at a moment's notice. Supt. Buffington went to San Francisco last week, and the men do not like to start the machinery till he returns, or sends orders for them to go ahead.

Placer.

A QUARTZ MILL.—*Placer Republican*, Feb. 16: The owners of the Drummond quartz mine have decided to put up a quartz mill on their property in the spring. The mine has been prospecting splendidly, and has proved to be as rich as any one could wish. It is situated about three-quarters of a mile west of Cottage Home on Brimstone Plains, and was discovered last October, by J. P. Drummond. It is owned by Mr. Drummond, C. F. Hoffman, William Jones, John Liddell, and J. B. Hobson. There are two ledges on the claim, one of which averages three feet in width with a coarse northwest and southeast. This ledge prospects from \$10 to \$20 a ton. The smaller ledge runs east and west, and is about a foot thick. Three cubic feet from the croppings of the latter ledge have panned out \$600 in a hand mortar. A shaft has been sunk in the footwall to a depth of 40 feet where it was found that the vein pitched off to the south, but the rock continues to be rich. The present storm has probably stopped prospecting for the present, but the coming summer will see this mine in shape and a fine property.

RISING SUN.—Owing to legal complications in which the Rising Sun mine at Colfax is involved, it is unlikely that any work will be done there before next fall.

MAYFLOWER.—But very little work is being done at the Mayflower tunnel just now, owing to a lack of fuel. One pump is kept going.

Plumas.

THE MINING SEASON.—*Greenview Bulletin*, Feb. 16: The last two weeks have materially brightened the mining outlook in Plumas. There has been an enormous fall of snow, thus insuring a good water season. All around are indications of greater activity in mining circles next summer. There will be am-

ple water in the Round Valley reservoir to operate all mills depending on it for power. The Green Mountain is said to be doing well; the Crescent shaft is going down rapidly with scarcely a doubt of development of a rich property; the Drury mine, which has been paying beyond the expectations of its owner, will be operated more extensively, and it is probable that work will be resumed at the Cherokee. A much greater quantity of work will be done in the Genesee section, while on the North Fork there will be quite a boom in drift mining. Numerous small operations will also be pushed with vigor. We, therefore, are assured of a much better mining season.

CRESCENT.—Work in the Crescent mine is progressing quite favorably. Good headway is being made in the shaft. It is gratifying that the Crescent Co. is determined to sink to quite a depth. It is scarcely possible that they should fail in developing a large body of ore as rich as that which made Crescent boom in days gone by. Work at this mine is conducted upon business principles. "Pay as we go" is a motto which the owners seem perfectly willing and able to live up to. The Green Mountain is pursuing the even tenor of its way. We are so accustomed to this regularity, under the able management of Supt. Rodgers, that we take but little note of it. We understand that a much superior body of ore has been reached. Mr. Bradford, the secretary of the company, came out from New York several days ago, and is now at the mine, snowbound.

San Benito.

OIL.—*Hollister Free Lance*, Feb. 18: Messrs. Charles Bronson and Frank Dintick, the latter a mining expert and the representative of large capital in San Francisco, the former also largely interested in the success of the present oil venture, went up to the Vallecitos valley this week, to give a careful examination of the works there as at present established, and to report upon the prospects. The oil well is at present down over 100 feet. It is about eight inches in diameter. A number of gentlemen interested in the project will arrive from San Francisco Saturday or Monday, and will proceed at once to the works. The indications at present are most favorable.

Shasta.

NUGGET.—*Democrat*, Feb. 16: A nugget weighing two ounces was picked up on Clover creek last week. C. E. De Forrest is having another arastra built, which will doubly increase the reduction capacity of his plant. Another furnace is being erected at the Redding Reduction Works and the plant increased to double capacity. The railroad company has promised to put in a side track for the works. The Paul 12-stamp circular battery at the Calumet mill is a grand practical success, so say all the quartz miners who have seen it at work. The company has ordered the second battery. The Redding Reduction Works have turned out so successful already that the company has decided to double the working capacity of the furnace, work on which has already commenced. Tons of ore is shipped to the works, and so great is the demand to have ore worked that Supt. Chick was compelled to restrict shipments. Jake Overmyer, W. A. Albertson and others recently located ground in the vicinity of Furnaceville that prospects "way up," and are thinking of building a mill there shortly. The mines at Furnaceville, those that have heretofore been worked, are known to be rich, but the ore is so base that several failures were made, but experiments will go on till some process will be discovered by which those rich base ores can be reduced successfully. Of late years several very promising mines have been discovered, the ore of which is free milling, which will be developed and worked. This will create renewed confidence in the camp. There is joy in French gulch over the prospects of lively times in the future caused by the developments made in the Lower tunnel, better known as the O'Neal tunnel, of the famous Niagara mine, owned by W. T. Coleman. At 1100 feet a rich body of ore has been struck, four feet in width, and reports say that there is enough in sight to last for years to come. Already an iron track is being laid to run the ore direct from mine to mill. Tom Greene is also improving on his former success, and Martin Jones, on the divide, is well pleased with his prospects in the old Mudrock mine.

A RICH MINE.—*Redding Free Press*, Feb. 12: Since S. P. Fillman has purchased a half interest in the Texas and Georgia mine from Mr. Day, thereby removing some financial obstacles to success, Dame Fortune seems to have smiled her sweetest smile upon them. A week ago Mr. Fillman introduced mercury on the plates specially prepared by Mr. Chick of the reduction works. The effect seemed to be a great saving of gold, for, in a five days' run, they cleaned up \$1000 in bullion. Of course, this yield made the owners happy, but there is still better luck to chronicle, for, besides the rich rock taken from the stope, the foreman miner, while penetrating a 14-foot ledge in the main tunnel, came across a large body of exceedingly rich rock, and he claims that it is the richest mine in Shasta county. Since the change in the management, an ore-feeder, rock-breaker and new plates have been added which are not yet in running order, but soon will be, when large results may be anticipated. The other mines of the Old Diggings district are also turning out well, especially the one bonded by Hopping, Bell & Co. to Riley & Co. for \$35,000.

Sierra.

A MILL NOTE.—*Tribune*, Feb. 18: The Sierra Batters folks have closed down their mill at No. 6 tunnel for the winter. The lower 60-stamp mill is pounding away regularly on bullion-producing ore.

OUR PROSPECTS.—When the snow disappears there will be busy times around this camp. Never in the history of Sierra city have there been such evidences of future prosperity for our people and town as there are at present. It is safe to assert that ere another year rolls round enough new and profitable mining enterprises will be inaugurated in this vicinity to make it the most talked of and liveliest district in the country. This camp is only yet in its infancy, but it is enjoying a good substantial growth that will eventually land it at the top of the heap.

THE PHOENIX MINE.—Up at the Phoenix mine all outside work has been suspended owing to perverse elements. In underground, however, some barmy miners are at work with hammer, drill and powder putting through an upraise. The vein has been exposed in the lower tunnel for a distance of

something like 250 feet. Taken throughout, the quartz yields excellent prospects, and the heaviest stockholders in San Francisco, together with A. C. Busch at this place, are fully satisfied with the mine as far as the developments have progressed.

CLOSED DOWN.—*Mountain Messenger*, Feb. 19: Young America has been closed for the past 10 days on account of the storm and deep snow.

NUGGET.—The story that a nugget weighing 5000 ounces was found near Dowville, at any time, is not founded on fact. The largest piece of gold ever found in this vicinity weighed 96 pounds, and was sold to Woodward, of San Francisco, for \$22,000.

Trinity.

DEADWOOD.—Cor. *Trinity Journal*, Feb. 19: Joseph Falan is doing active prospecting on the Vermont property, having leased various portions to different parties who appear to be well satisfied over the outlook. Mr. George Kline is actively engaged in both extracting and milling ore, and appears quite contented over the results. Mr. Wm. Lappin has again put in an appearance on Deadwood and intends opening up in good style at the opening of spring; an abundance of good milling ore is in sight and further developments may yet prove its extensiveness and value. Van Matre Brothers are still taking out good ore, and Reynolds & Co., of the Rising Sun mine, are taking out very rich rock from a fair-sized ledge. George Chenoweth, on the Black Bear property, made a new discovery some few months ago and at present has several men employed extracting ore that will go into the hundreds. Some damage was done to the Huntington mill, erected some time ago on the Dead-draught mill, by the shed falling down in consequence of the recent heavy snow. The Sulphure Reduction Works, near the mouth of South Fork, has proved to be a grand success, good and creditable work being done. All the older mines are prospering as usual, that is to say, we have no direct complaints, and everything appears to move on as smoothly as a trade dollar. Most all the arastras are in operation. Yes, sir; next spring we expect to blossom out like the rose with prosperity and advance still further the quartz interests of our ever-glorious camp. The present heavy storms rushing down the side of our mountains will give the prospector a chance to discover, and the many small mines and prospects which bear the emblem of future prosperity will be pushed ahead by Deadwood's industrious bands.

NEVADA.

Beveridge District.

ACTIVE.—*Walker Lake Bulletin*, Feb. 16: Beveridge district is becoming active, a large sale is in prospect, and the indications are that there will be a rush to that camp within a few months.

Esmeralda District.

TO RESUME.—*Esmeralda News*, Feb. 10: Arrangements are being perfected by the New Esmeralda company to resume operations on an extensive scale, and thoroughly prospect their extensive mining property in Aurora district. Strong hopes are still entertained that Aurora will again be a booming camp. The Silver Lining is reported as working along with the usual number of men and that it is showing considerable improvement. A connection is being made between the tunnel and the upper level. Quite a large body of ore is now in sight, and it is believed that when the connection is completed this mine will become a bullion-producer.

Gold Mountain District.

PROSPECTORS.—*Walker Lake Bulletin*, Feb. 16: The Gold Mountain prospectors are all feeling well. There will be heavy work done in that country within the next year.

Hawthorne District.

THE BEST DISTRICT.—*Walker Lake Bulletin*, Feb. 16: Nevada is richer in minerals than any other State. It will be truly conceded that Esmeralda county has no rival in variety and extent of mineral wealth, and in this county, Hawthorne district will soon lead, as the best district. The oldest and most experienced mining men admit that they never saw a district so richly endowed or so curiously varied as to the character of its ore. In every direction, mineral belts extend, some large, some small, all, however, promising well, and nearly every one with a distinct character of rock. The continued discoveries of rich ore make it a certainty that this district will some day be the greatest bullion-producer in the State. Should water not be found within a reasonable distance from the mines, the great value of the developments will finally induce men of means to bring some far-off stream to the district, and then nearly every claim in an area of many square miles will be valuable. "Time will tell," so everybody says, and the ancient mower will not be much older before he opens his mouth and proclaims the wealth of Hawthorne district.

Kinkead District.

MOSS MILL.—*Walker Lake Bulletin*, Feb. 16: The Moss mill at Kinkead resumed work yesterday, and Kinkead is again a live camp. The mill begins on ore from the Toronto, which was taken out by John Warner and Alex. Morrison on a lease. This ore is rich in free gold, and will give a good start to the renewal of operations. Kinkead is the district of rich rock, and there will be considerable activity there this year. The Toronto has a fair supply of rich rock in sight, the Montreal is liable at any time to again show a body of the wonderfully rich quartz which made the reputation of the district, and a new claim has been opened which will of itself make the district lively. The Warner, recently located by John Warner, is a large ledge of good rock about two miles from the mill. The ore deposit is extensive and easily mined. There are now many tons of rock ready for the mill, which will be worked as soon as the ore from the Toronto lease is finished. The Regulator, a claim owned by Moss & Warner, will also be worked this year. This claim has a good ledge of fair average, and will furnish a large quantity of rock for the mill. All the difficulties have been settled and the mill will probably keep sending out bullion from now on without interruption.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Feb. 16: Line crosscut, 150-foot level, has been extended 8 feet; total length, 71 feet. Drift north from this crosscut has been advanced 11 feet. The vein matter is

about 20 inches wide, but does not assay anything of value.

TORNADO CON.—Extended west crosscut 3 feet in very hard quartz; total length 40 feet. Encountered in same, 20 feet in, a six-inch streak of promising quartz giving low assays in silver. The face of crosscut is again in promising stringers which will bring us on another pay streak within a very few feet. Unable to get supplies to the mine, we are forced to suspend work for a short time.

NAVAJO.—Have started a drift south from line crosscut east, 150-foot level. Fair progress is being made with all other work in and about the mine.

NORTH BELLE ISLE.—Gangway north on the 400-foot level has been extended 18 feet. The ventilation has been materially improved the past week by changing the current of air back of the upraise, into a line of air-boxes, that has been carried to the face of the drift. Fair progress has been made in extending the drifts north on the 150 and 70-foot levels. Repairs and other work have been forwarded as usual the past week. Will close down to-morrow to clean boiler.

NEVADA QUEEN.—Resumed work in north gangway 300-foot level. Gangway on the 200-foot level has been extended 18 feet. In the crosscut from the gangway to the shaft on this level, several sets of timbers have been put in during the week. The shaft has been sunk 10 feet. The flow of water continues to increase. Little or no progress has been made the past two days.

ARIZONA.

STOCKTON HILL.—Cor. Mohave Miner, Feb. 19: For a month past mining business has been at a standstill as far as the shipments of ore are concerned, although the C. O. D. has sent down to the sampling works at Kingman a couple of carloads of ore sorted out from the proceeds of the mine in December. But it must not be inferred from this that the mines are giving out, or that the ore bodies have disappeared, but, on the contrary, it should be made public that our two prominent mines, the C. O. D. and the Cupel, have both been putting in new hoisting machinery, and making other improvements necessary to the safe and economical working of the mines. In addition to the erection of hoisting works, the owners of the C. O. D. mine have just finished the building of a road from Wallapai valley direct to the mine, which has been done at a considerable cost, some say as much as four or five thousand dollars. Steam was gotten up last week, and the work of sinking the main shaft, already down 215 feet, continued, and it is reported by those working in the shaft that the ore body improves with every foot. This is fully borne out by the amount of ore coming to the surface. On the Cupel mine, the hoisting works, which are a duplicate of those on the C. O. D., have been put in position and are now working to perfection. After passing some 30 feet of barren matter at the water level, a vein of ruby and native silver ore, some two feet wide, was struck, which assays from a three-ton sample, nearly \$400 per ton, and as depth is attained the ore seems to improve, so that competent experts estimate the ore taken out in the past two or three days to be fully worth \$1000 per ton. The two mines mentioned are the first of the Mohave county mines to prospect below the water level in proper and business-like shape. That each of them, in one month's work out of sinking of a shaft alone, will make money enough over and above the ordinary running expenses of the mine, to pay the cost of the hoisting machinery, is the best argument your correspondent can advance to prove the fact that the mineral wealth of Mohave county's mines lies below the water level.

DIFFERENT DISTRICTS.—Prescott Courier, Feb. 15: Frank Kuhne, of Walker district, told us, yesterday, that miners are hard at work and very hopeful, now that sampling, and, maybe, reduction works, will soon be set up in Prescott. Mr. Rowe has big piles of ore on dumps at the Davis mine, Col. Bigelow, Dave Grubb, and other mine-owners of Hassayampa district, will send in plenty of ore to the sampler. We have very good news from Peck district. Mr. Dawes is running his mill, and his air compressor is doing good work. Want of wood has been the main cause for having kept the mill idle, but now he has a supply and will make constant shipments of silver. The Nevada mine, Groom Creek, the Reach & Mulvenon Turkey Creek, are yielding very rich rock. Chances are that the Tiger, Gray and Eagle, and some other mines in Bradshaw mountains, will be worked in the spring. Complaint is made that the owners of patented mines will not work them, nor will they permit others to do so. If owners of such mines do not care to run them, they ought to lease them to responsible miners. Flush times are expected in Tonto basin and Cherry creek districts, where moneyed men are preparing to operate. Scarcity of water prevents placer miners from washing gulch gravel, but many of them are doing well with rockers, and not a few are making wages with pans.

YAVAPAI M. & M. CO.—J. W. Coover, of the St. Louis Yavapai Mill and Mining Co., says the Phenix Herald, with Gus Bauer, came down from Trip Top to-day, arriving a little after noon. They brought down five bars of bullion made from the ore on the dump of the old Trip Top mine. They average 935 fine and weigh 1285, 1251, 1255, 1277 and 1246 ounces respectively, making 6311 ounces. This shipment is directed to E. Hayden, treasurer of the company, in care of the Bank of Commerce, St. Louis, Mo. These bars represent the work of a stamp mill for two weeks. The ore is first crushed, then concentrated, 20 tons into one, by six Frue vanners, then roasted and amalgamated as in the ordinary process.

COLORADO.

SHIPMENTS.—La Plata Miner, Feb. 16: Shipments from the Aspen were resumed to-day. The Queen Anne is showing a good ore body, nearly pure galena. The Buckeye will be one of the leading outputters of the camp the coming season. A contract for 200 feet of tunnel work has been let on the Old Lot crosscut to Ouray parties. The ore shipments were resumed yesterday, and the Red Mountain road is again in passable condition. The bond on the Little Annie and Red Mountain expired yesterday, but it is yet possible that a sale can be effected. Ben Hewitt is working 40 men in the

upper workings of the Old Lot. Good progress is being made on the big tunnel. Eight men comprise the force on the Sunnyside, and all are working in ore. A pile containing several carloads is in the orehouse. The Silver Lake has opened up five feet of ore, according to the latest news from the mine. There is an immense quantity on the dump. The late strike of mineral in the sixth level of the Silver Bell is about 14 feet wide, all solid ore, worth \$200 per ton. The ore has the appearance of extending into the mountain.

IDAHO.

THE CATHERINA.—Ketchum Keystone, Feb. 12: Messrs. Cleek and Stover, who have been working the Catherina mine during the winter, were in town in the early part of the week and give a very good report of the work accomplished during the past month. A progress of 32 feet was made in 16 days in sinking, and a vein of ore averaging six inches in width disclosed, all of high grade, and will go over 200 ounces to the ton. They expect by spring to have the mine in good working shape for next season, and also enough ore to pay them well for the winter campaign in Bassett gulch.

BLUE JACKET.—Gus Duer is in from his mine, the Blue Jacket, which is situated between the Elkhorn and Quaker City. He reports the prospect encouraging. An incline has reached the depth of 80 feet, dipping in a westerly direction. A drift is now being run on the vein, which shows a three-inch streak of 500 and 600-ounce ore. The vein matter is 18 inches in width, and shows better as work progresses. The indications are that a large body of ore will soon be found.

THE BACK PAY.—This mine is situated northwest of the Blue Jacket, and has been up to a late day worked by its owners, H. C. Lewis and Mrs. Dixon. They have ore, with indications for a good body. H. C. Manus has a claim in the vicinity of the Back Pay which offers inducements for thorough prospecting. A tunnel, which is now in 200 feet, will tap the vein at a depth of 300 feet.

MONTANA.

THE CABLE MINE.—Anaconda Review, Feb. 17: Mr. J. C. Savary, owner of the Cable mine, came down from Cable yesterday, and went up to Butte. He reports the Cable mine to be running full blast. It was started up on his return about 10 days ago, and has been running ever since. The breaking of the cylinder in the air compressor was the cause of the shut-down. The new cylinder of the air compressor has been put into position and is working satisfactorily. Work is also being done with the diamond drill.

THE PYRENEES.—From C. H. Moore, superintendent of the Pyrenees mine, who was in town last week, we learn the following items with reference to the mine at Georgetown. The Pyrenees mine is now running full blast, as it has been for the last 10 months. It is running on ore from the recent strike and is paying well. It is giving steady employment to 22 men. Large bodies of fine ore are in sight, and it is impossible for the present works to keep pace with the development of the mine. It is likely that extensive additions will be made to the present 10-stamp mill early in the spring. The Pyrenees shaft is now down to a depth of 220 feet, and the property continues to look better with every foot of depth. The Grubstake, near Georgetown, is considered a very promising prospect. Nothing is being done on it this winter. Some development work is being done on the Southern Cross mine, owned by Salton Cameron. An incline shaft is being sunk and has already reached a depth of 100 feet. There is between three and four feet of snow on the ground in the vicinity of Georgetown.

GRANITE.—Phillipsburg Mail, Feb. 15: Mill moving steadily and crushing the usual amount of ore.

HOPE.—The Hope mill is running steadily; any quantity of ore in the mine. Nothing worthy of note in connection with company affairs since our last issue.

BI-METALLIC.—Shaft still going down. Three shifts of men are making fair progress. The country rock is a hard gray granite. Level development shows the bonanza to improve west, the level east not showing so well. The floor of this level cannot intersect tunnel No. 6 of the Granite, there being a difference of 190 or 200 feet between the two. The Blaine has at present the deepest ore working in the granite country.

WEST GRANITE.—The north crosscut is in from the station 20 feet, header in very hard and compact gray granite. Two shifts are driving ahead as fast as the above unfavorable conditions will permit. The shaft started on the Fraction, near the southwest corner of the Granite Extension claim, is under cover, and down 30 feet. Work has been stayed here, owing to the inclemency of the weather. It is claimed that this shaft will penetrate the vein exposed in No. 6 level at a depth of 70 feet or less. Just above this working and distant but a few feet east of it the Granite Co. is also sinking. Nothing definite can be ascertained as to their purpose for doing this work aside from the report that it will be used as an air shaft for No. 6. As a matter of fact nothing reliable can be ascertained as to the intentions of either company in relation to the ledge in the Granite or Fraction ground. Just where it is or anything about it is left entirely to conjecture. The idea seems to prevail that these mines should be removed from the district, one being left in Helena and the other in St. Louis.

LOWER WILLOW CREEK.—Bastion & Co. are working the Screamer lode with good results. The tunnel is now in 108 feet, with three feet of concentrating ore of excellent quality to the footwall. The vein improves with depth, and if the present showing continues as favorable a large amount of milling ore will be on the dump ready for shipment by May 1. Mr. B. has seven men at work and will, as soon as the weather permits, put more men on and open out the Silver Crown, a lode adjoining the Screamer on the south.

FLINT CREEK CANYON.—Mellan & Co. have one shift of men working on their lode. The header of the tunnel shows about 10 inches of very high-grade rock.

ALICE COMPANY SHUT DOWN.—Butte Inter-Mountain, Feb. 19: Superintendent W. E. Hall, of

the Alice, gave orders today to shut down the company's mills and mines. The cause of this movement is that there is no salt to be had. Mr. Hall had a very large supply on hand before the railroad blockade, in fact all that he could store away, as he had anticipated the danger some time ago and thought he would be prepared for any emergency. He had over 150 tons stored away, which was all he could handle, but, as it had been over two weeks since any salt arrived, the supply on hand naturally gave out. Mr. Hall regrets very much having to shut down, as it causes quite a loss to the company as well as to the employees. The blame, of course, can only be attached to the elements. Work will be immediately resumed on the arrival of salt. The Silver Bow mill shut down for the same cause last Wednesday. The Moulton and Lexington mills have a limited supply of salt on hand which will only run them a few days more.

NEW MEXICO.

MAGDALENE DISTRICT.—Socorro Bulletin, Feb. 12: Wm. Trimble is dumping ore out of the Juana contract. Reports of an important strike of gold not far from Kelly are current. Supt. Huber, of the Kelly, is south, inspecting some valuable properties of Mr. Gustav Billing. Hollenbeck & Clark are dumping excellent galena and carbonate mineral out of their Miriam claim. The Imperial mine continues to be deepened and explored under the superintendency of H. D. Bates. J. W. Virgin and A. Hasty are dumping argentiferous galena from their Hop Canyon claims, which also afford gold. The Bennett and Stephenson mines in the Organs are both being actively worked, and the ore shipped to Socorro for treatment. Shep Lewis is sacking ore out of his Badger group, preparatory to shipping to Socorro. These properties are situated at the north end of the Magdalenas, some distance north of the railroad track. Work on Roseboom's Spring Lode, in Patterson canyon, will be resumed as soon as he has pumping machinery to exhaust the water which now impedes its development. The construction of the wagon road from the Cavern mine to the railroad track at Kelly is still under way. W. H. Patterson is the contractor. He is also to deliver 200 tons of Cavern ore on the cars, all of which is to be completed in 40 days. Work on the mine has been suspended until the road is completed, when the extraction of ore will be resumed. The boys in the Graphic and Greyhound are striking excellent grade ore at every point in these properties. They can at any time flood the Graphic smelter with high-grade lead fluxing ore. The silver value of the ore has materially increased within a few months past. Supt. Koneman is now employing 45 men and ships from five to six cars of ore daily.

TUNNEL.—Black Range, Feb. 15: The contract to run the Midnight tunnel which is now about 85 feet in length, 150 feet farther, has been let to Billy James and John Bwetic. The contractors left yesterday for the scene of operations with supplies, and work will be commenced immediately. Jim Smith and Andrew Kelley returned this week from the alleged gold discovery in the San Mateo's. They report adversely to the glowing accounts which were circulated. But, however, while there Smith saw some very nice specimens, which Kelley says made Smith's mouth water. For further particulars see Smith.

NO GOLD.—The San Mateo gold find does not pan out, and is simply a farce. The pay streak of the alleged bonanza is very small and irregular, the ore running about 40 per cent silver and about the same percentage in lead, the gold is yet to be found. So the Range is informed by those who examined the property. The Pitcher Bros. are working their St. Cloud mine. They are drifting on the lead both ways from the shaft in a good body of ore. The St. Cloud will make a carload shipment of ore in a few days. If other mine-owners of this district would follow the example of the owners of the St. Cloud they would find it much more profitable than letting their properties lie idle. Idle mines pay small dividends.

OREGON.

CANYON CREEK.—Cor. Rogue River Courier, Feb. 14: Everything seems to be running lively in the various mining claims of this section. Brown, Naucke & Co. are running their pipe a good portion of the time, and shoveling off the gravel at a lively rate; but the increase of water in their diggings will be a big thing for them. Russ and Brown are piping all the time with a good prospect of making it "pan out" this season. Naucke, Brown, Hall, Bybee & Co. are making the gravel fly lively with a big head of water. I understand through Mr. Brockman, the foreman, that they have struck it very rich. They did well last year, but will do a great deal better this year. John Havlin is piping, when he has water, but has been short of water a part of the season. Oscar Green is doing good work in his claim with a large self-shooter. Hamilton works his mine when he feels like it; as he has plenty of money, he can take it easy. Butler did not get his ditch completed last summer, hence is not doing much in his claim. He is working on his quartz in Lightning gulch, which has indications of being very rich. Harry Stone's valuable placer mines are lying idle, because he is not able to superintend them. Alex. Watts has his pipe in full motion, with the best of prospects, in his claim in Day's gulch. It is thought he will make a large cleanup.

UTAH.

ORE.—Southern Utah Times, Feb. 16: O. T. Clark has opened a fair body of ore in Monitor. The Horn people have shut off the night shift at the mine. North Star chlorides are doing profitable work, as is shown by the four-car shipments of recent date from Milford. James Barratt has made a strike of high-grade ore in the Jobanna mine, and will soon make a shipment from his headquarters in Star. Sam T. Godbe has been working a few men on the Summit mine in Bradshaw, with good results, and teams have been put on to haul the ore to Milford. A new and important strike has been made in the Cave mine in Bradshaw, property of the Godbe people. Jones & Co., bankers, and James Lavelle, are the lucky ones.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING FEBRUARY 8, 1887.

- 357,358.—COLLAR-BUTTON—L. Paet, S. F.
- 357,169.—SPRING SHACKLE—Bergman & Miller, Bienen Vista, Ogn.
- 357,367.—FLOAT FOR CARRYING LINES OF PIPES FOR DREDGES—E. Chaquette, S. F.
- 357,373.—PROGRAM ALARM CLOCK—Ellen Cushing, S. F.
- 357,392.—SPECTACLE FRAME—W. R. Johnston, S. F.
- 357,395.—WATCH CASE—J. C. Landman, Eureka, Nev.
- 357,212.—HORSE-POWER—B. A. Lombard, Stockton, Cal.
- 357,329.—TENT—M. P. McKoon, El Cajon, Cal.
- 357,402.—FILTER—McLean & Cumming, S. F.
- 357,411.—HEATING APPARATUS—R. A. Rew, Pomroy, W. T.
- 357,413.—HYDRAULIC RAM—John Richards, S. F.
- 357,424.—BALANCED SLIDE VALVE—A. J. Stevens, Sacto.
- 357,246.—WINDOW SASH—T. A. Sweet, Paso Robles, Cal.

FOR WEEK ENDING FEBRUARY 15, 1887.

- 357,652.—WINDMILL—D. P. Barrett, Oakland, Cal.
- 357,822.—HARVESTER REEL—Jos. Gilbert, Los Angeles, Cal.
- 357,664.—CLIP FOR WIRE ROPE WAYS—A. S. Hildie, S. F.
- 357,773.—SHELL EXTRACTOR—C. H. Keenan, Ft. Halleck, Nev.
- 357,775.—EVAPORATOR—W. F. Lambert, S. F.
- 357,612.—CAR AXLE—I. W. Lewis, Portland, Ogn.
- 357,841.—HOEING AND RAKING MACHINE—D. Lubin, Sacto.
- 357,842.—CLOD-CRUSHER—D. Lubin, Sacto.
- 357,843.—CLOD-CRUSHER—D. Lubin, Sacto.
- 357,844.—CLOD-CRUSHER—D. Lubin, Sacto.
- 357,798.—VAPOR-BURNER—Wm. Wainwright, S. F.
- 357,799.—SPRINKLER—Wm. Wainwright, S. F.
- 357,802.—FOG-HORN—Geo. White, S. F.
- 17,111.—DESIGN—W. V. Arthur, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

The leading Washoe stocks diminished in value materially at the close of the week. There is considerable interest in Ophir just now, indications pointing to a development in that mine at greater depth. The next point of interest north of the Ophir is the extension of north drift on 1300 level in the Mexican, and the progress of the East crosscut at the Ophir North line on the same level. In the exploration on the 500 level in the Mexican mine a broad belt of mineralized decomposed matter, of which the component parts were heavy clay and quartz, was exposed. Subsequent explorations of the downward extension of this belt on the 700 level disclosed that the mass was concentrating, and inspires a well-grounded hope that the entire belt will be found developed into ore at a greater depth. Hence the interest in the present operations on the 1300 level. The Virginia Chronicle of the 21st says: The 29 stamps in Six mile canyon are hung up on account of the low temperature of last week freezing solid the water of the creek which supplies the quartz mills with motive power. Following is a list of the mills shut down and the complement of stamps in each: Bowie's, 5; Hully's Empire State, 5; Fisher's, 2; Hully's Flowery Mill, 5; Courser, 5; Bossell, 5; Pfeiffer's, 2. The Winfield mill, in Seven-mile canyon, has a complement of five stamps and is operated by steam-power. It is owned by A. J. McCone and has been shut down nearly two years. When these mills are in operation they represent a combined crushing power of 100 tons of ore every 24 hours during high water in the creek.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Feb. 16, \$28,192; Hanauer, 13, \$4700; 15, \$12,000; 17, \$6300; Crescent, 18, \$2190; Hanauer, 18, \$8800; 19, \$2625; Ontario, 18, \$53,863; Bannock, 16, \$2600; Silver Reef sulphides, 18, \$1600. Wells, Fargo & Co., Salt Lake, received last week \$76,409; McCormick & Co., \$73,355; T. R. Jones & Co., \$14,435. The metal shipments out from Salt Lake city for the week ending February 10th were 11 cars of bullion, 290,650 pounds; 44 cars silver ore, 991,642 pounds; 4 cars copper ore, 112,950 pounds; total 59 cars, 1,395,242 pounds.

MECHANICS' INSTITUTE TRUSTEES.—The annual election for trustees of the Mechanics' Institute, to serve for two years, was held Wednesday, and resulted in the election of the following gentlemen: Columbus Waterhouse, Geo. Spaulding, C. F. Bassett, James Spiers, I. C. Stamp, S. J. Hendy and John Mallon.

THE Lidgerwood Manufacturing Company, 95 Liberty street, New York, has just issued a new catalogue for 1887. It is replete with everything in the way of hoisting engines and apparatus, including boilers. Copies cheerfully furnished to engineers and prospective buyers.

JOHN GILMAN writes the Hailey (Idaho) Times from Worcester, Mass., that he has organized a railway company there to build a railroad to the gold belt, and has purchased the rails. The company has a capital stock of \$800,000. The length of its road is to be 18 miles.

New York Metal Market.

Telegraphic advices dated Feb. 24th give the following New York prices:

BAR SILVER—\$1.01 1/2 per oz.
BORAX—5 1/2 @ 6 1/2 c.
COPPER—LAKES—\$10 1/2 @ \$11.
IRON—No. 1, \$22.00 @ \$22.50.
LEAD—\$4.37 1/2.
QUICKSILVER—52 @ 54 c.

The following is the latest by mail from the "New York Metal Exchange Market Report":
COPPER—Dull, spot closing at 10.75 @ 11.00.
Transferable Notices (Lake) issued at 11.85 @ —.
Transferable Notices (Chili Bars) issued at 4.39 1/2 @ 6.

LEAD—Quiet at \$4.35 @ 4.40 spot. Transferable Notices issued at \$4.47 1/2.
TIN—Dull at \$22.45 @ 22.55. Transferable Notices issued at \$22.50.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.—Australian Tin, \$22.60 @ 22.80; Billiton Tin, \$23.10 @ 23.40; Banca Tin, \$23.15 @ 23.50; Baltimore Copper, \$10.00 @ 10.25; Orford Copper, \$10.00 @ 10.50; P. S. C. Copper, \$10.00 @ 10.50; Foreign Lead, \$4.75 @ 4.85; Foreign Spelter, \$4.75 @ 4.85.

MAKER'S PRICES—At tidewater, 100 ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.50 @ 22.50; No. 2, \$20.00 @ 21.00; Grey Forge, \$17.50 @ 19.00. Hudson River, Grade No. 1, \$22.00 @ 22.50; No. 2, \$20.00 @ 21.00; Grey Forge, \$16.00 @ 16.25. Southern, Grade No. 1, — @ —; No. 2, — @ —; Grey Forge, — @ —.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irremediable party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE Walker Lake Bulletin says the Mount Diablo mill will soon be completed. A large quantity of ore will be ready for reduction.

THE ORIGINAL
Roller Ore Feeder

This form of Ore Feeder is well adapted for its peculiar work.

In reference to a similar form of "Roller" Feeder, which is being manufactured and offered for sale in this city, and of which a cut appears in this journal, we have to say that the Superintendent of the Bunker Hill Gold Mining Company states that the "Challenge" is far superior to the "Roller" Feeder, having had both of them operating side by side. We shall be pleased to show this letter, upon application, to any one interested.

We are also manufacturers of the "Challenge" and "Stanford Improved."

Prices furnished by the
JOSHUA HENDY MACHINE WORKS,
89 to 91 Fremont St. San Francisco.

ORE FEEDERS.

We direct attention to an advertisement, which appears in our journal, of the "Original Roller" Ore Feeder, manufactured by the "Joshua Hendy Machine Works," of Nos. 89 to 91 Fremont St., this city.

As the manufacturers of a similar form of Feeder, known as the "Templeton Roller," claim that it is superior to any other style, and cite those in operation at the "Bunker Hill" mill in Colorado county, we expressly contradict the statement, and in substantiation submit a copy of a letter shown to us by a representative of the "Joshua Hendy Machine Works," which speaks for itself.

BUNKER HILL GOLD MINING CO.,
AMADOR CITY, CAL., July 12, 1886.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ore to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the Feeder, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will elude right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,
(Signed) N. W. CROCKER, Supt.
SAN FRANCISCO, Jan. 3, 1887.

To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: Having used four (4) of the "Roller" or "Templeton" Ore Feeders, built by the Golden State and Miners' Iron Works, of this city, for more than a year last past, in the Bello Copher Mill, in El Dorado county, this State, and being acquainted with the superior principle of construction and the operation of the "Challenge" Feeder built by yourselves, I unhesitatingly indorse the statements made by Mr. N. W. Crocker, Superintendent of the "Bunker Hill" Gold Mining Company, under date of July 12, 1886, as to the irregularity of the feed of the "Roller" or "Templeton" Feeder under the conditions of use which he names, and I am very truly yours,
(Signed) W. G. ROBERTS,
Of Greenwood, El Dorado Co., Cal.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 60 cents additional per volume.

ASSESSMENT NOTICE.

The Phelps Manufacturing Company.—Location of principal place of business, San Francisco, California. Location of works, San Francisco, Cal.
NOTICE is hereby given, that at a meeting of the Board of Trustees, held on the 12th day of February, 1887, an assessment (No. 1) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 17 Drumm street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 21st day of March, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 6th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expense of sale. By order of the Board of Trustees,
W. H. PHELPS, Secretary.

OFFICE—17 Drumm St., San Francisco, Cal.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

TESTIMONIAL.OFFICE OF THE EUREKA ELECTRIC LIGHT CO., }
EUREKA, CAL., Feb. 15, 1887.

San Francisco Tool Co., San Francisco, Cal.—GENTLEMEN: In answer to yours of Feb. 8, 1887, would say: The four engines purchased from your Company in January, 1886, have been running continuously ever since, from 12 to 16 hours each day, not excepting Sundays, and have never given any trouble; and, furthermore, they have never cost us anything for repairs. I consider them fully as economical as our slide-valve engines, which we are using. One of them is a balanced valve, Haskins' make, and the other is the New York Safety Power Company's make. The relation to the cost of keeping your Single-Acting Engine in repair to the cost of keeping the Slide-Valve Engines which were purchased the same month we purchased your engines, and working under the same conditions, is, that while there has been no expense in either material, or labor on the engines furnished by your Company, the expense of keeping the Slide-Valve Engines in good running order, has cost, on an average, \$8 to \$12 per month for each engine.

A portion of the time the Single-Acting Engines have been run by the fireman, and I can recommend your engines to parties that are not close to a machine shop, and do not want to keep an engineer and fireman, as with your engine all the attention they require is to fill the oil cups once every 16 hours, and turn the steam on and shut it off. The balance of the time the engine takes care of itself. Yours truly,

A. A. OSBORN, Superintendent.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co., Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of the SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machine EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft, and is CAPABLE OF CARRYING 500 feet of five-eighths steel rope. SEND FOR CIRCULAR.

Alaska Mines.

The last steamer from Alaska brought down \$60,000 in hullion from the "Treadwell mine," on Douglas Island. This mine has one of the best gold mills in the United States. It was built in this city and has 120 stamps, run by water-power. It has a complete outfit of concentrators, etc., and has been successful from the start. The ledge is a very large one, composed mainly of low-grade ore, and yields from \$60,000 to \$75,000 a month. Other claims on the mainland near by will soon be developed.

More or less prospecting is going on in Alaska during the season, though at this time of the year little is done. Those who try to do much in winter in that region have a hard time of it. Recent Alaska papers contain an account of a trip of Tom Williams, a miner from Stewart river. A young Indian found him on the trail seven miles from

weather drove them back. It is thought a rich strike has been made, and the steamer Ynkon has been dispatched up the river to secure the cached mail, but had not returned when the Idaho left.

At Red Alder Gulch, Sutter county, this State, a minor named Thomas Dongan was killed by a snowslide, last week. He and two other men were asleep in their cabin, and he was awakened by a noise and ran out, shouting to his companions. The cabin was wrecked,

Pressure-Boxes for Mining Purposes.

The pressure-hox used in the bringing of water to hydraulic mines is situated at the end of the ditch, in a commanding position above the claim, and from it the water is delivered into the supply pipe.

The hox derives its name from the fact that the head or pressure is measured from this point. Connected with or forming a part of the pressure-hox is the sand-hox, which is sunk below the level of the flume or ditch, and ar-

of these pressure-hoxes, which we give herewith, the description being taken from the same work. The following is a description of a pressure-hox at the La Grange mine, Stanislaus county: Some 350 feet to the rear of the pressure-box there is a sand hox in the ditch connecting with the waste-way. This sand-hox is 2 feet deep (below the bottom of the ditch), 4 feet wide, and 4 feet 3 inches long, and communicates with the waste-way by means of a gate, which slides clear to the bottom of the hox. At the pressure-hox, the 4 end posts and

the two caps belonging to them are made of 6x8-inch lumber. The six intermediate posts, three on a side, are of 6x6-inch material, and their caps are of the same dimensions. All the sills, and the two longitudinal stringers on which they rest, are of 6x8-inch "stuff." Up to high-water mark the hox has a double lining made of two one and a half inch planks flattened at the

PRESSURE BOX BETWEEN DITCH AND SUPPLY PIPE IN HYDRAULIC MINES.

Healy and Wilson's store, famished and frozen, and the Indian packed and dragged him on a sled to the store. He was nearly dead, but Wilson gleaned from him that he had been 50 days making a trip in company with the Indians. They had three dogs and one sled. Two of the dogs gave out on the lake and the men traveled on snowshoes to the summit of the range, where they built a snow-house, which occupied four days of intense cold. The fifth day they abandoned the house, and in five days only made two miles. Williams died 36 hours after arriving at the store. Before dying he told Wilson that letters and gold-dust had been abandoned at the snow-house, principally for McQuestin; also stated that 100 men near Stewart were greatly excited over the discovery of coarse gold on Mill creek, and his main object was to reach San Francisco before McQuestin left. Nothing definite could be obtained from the dying man in regard to the strike, but it is thought he was on a secret mission and wanted McQuestin to bring in a large supply of goods. Parties went in search of the cached letters and dust, but the severe

and the two men somewhat hurt, but the one who had run out was the only one killed. He was hurried in the debris at the bottom of the gulch. A supply cabin, blacksmith-shop and an old outhouse were swept away also, but the 10-stamp mill at the mouth of the Kennebeck shaft escaped.

As soon as Congress adjourns, Senator Stanford will go to New York and Boston to consult with Francis A. Walker, in regard to the plans for his university in this State. He expects to begin five of the buildings this summer. Senator Stanford said that one of the more important things that he was considering was the selection of a president. He wants a man of affairs as well as a scholar. After he has selected a president, he intends to call the trustees together to select a corps of professors.

An explosion occurred on Tuesday in the Beanhean colliery at St. Etienne, France. Latest advices say there were 104 men entombed in the mine, and that 43 have been recovered and 16 are dead.

ranged to catch the gravel or sand carried along by the current. It is emptied by a side gate, as circumstances may require.

The pressure-hox is a large wooden receptacle, generally constructed of 1½-inch planks, and securely held together with timbers. It is sufficiently large and deep to keep the head of the pipe which enters it under water with a steady pressure.

A grating of bars is arranged to catch all floating material, such as sticks and leaves. The water should be quiet and sufficiently deep to prevent any air from being carried into the pipe. For this purpose the hox is divided into compartments, one of which receives the water and quietly discharges it into the second pipe through lateral openings. There should be no perceptible difference between the water supply and the discharge; or, if any, the former should be in excess, and the surplus should be regulated and discharged by a waste-gate placed near the end of the flume. Some pressure-hoxes are arranged for two pipes.

In Aug. J. Bowie, Jr.'s work on "Hydraulic Mining in California," are engravings of one

joints with strips one-half inch by four inches. A 22-inch pipe takes the water. Nine feet from the hox there is a five-inch diameter stand-pipe which extends two feet above the top of the pressure-hox.

In large claims the pressure-hox ranges from 10 to 20 feet in length with a single pipe, and, where two pipes are used, from 12 to 30 feet. Larger hoxes are also built where the pressure, sand and measuring-hoxes are combined in one.

The pressure-hox at the Bloomfield mine (see engravings) is 18 feet long and 6 feet wide, so arranged that the sand falls under a wooden diaphragm into a large chamber provided with a gate.

The Senate Appropriation Committee has increased the number of new cruisers authorized to be built in the Navy Appropriation bill from six to nine, and added several million of dollars to the bill as passed by the House.

There is to be a hullion refinery at Helena, M. T., in connection with the U. S. Assay office there. Bars only are to be produced,

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Extraction of Gold.

Loss by Amalgamation and the Remedy.

EDITORS PRESS:—The loss of gold in the battery, and by the usual methods adopted for its extraction from the ore, amounts to from 5 to 95 per cent of the amount actually present in the rock as shown by assay. This loss is dependent upon the refractory nature of the ore and the mechanical devices used in the process of extraction. The principal cause of loss is the want of perfect chemical contact between the gold alloy and the mercury in amalgamation. Much of this is due to the defective mechanical arrangements adopted for securing the gold, but the most of it is due to causes of a chemical nature, which the best mechanical manipulation can but partly overcome; e. g., pyritic rocks, when ground, generally "flour" the mercury, and true chemical contact between the gold and the mercury is by this means much impeded or entirely prevented. Metallic arsenides or sulphides, sulphur and sulphureted hydrogen are frequently active in producing this "flouring" of the mercury. Mr. Skey has shown us by his experiments that the most active cause of "flouring" in many ores is the protochloride of iron (green vitriol), and that the product of decomposition of the arsenides and sulphides is more to be dreaded than these metallic substances themselves. A more common cause of "flouring," however, is due to the action of the sulphate of iron.

The sulphate of copper (blue vitriol) is also an obstacle to amalgamation, and, like the sulphate of iron (Skey believes), forms sub-sulphates of mercury and iron and copper which persistently adhere to the surfaces of the gold and prevents amalgamation. Skey also found by direct experiments that antimony is a metal not readily amalgamated, but he detected antimony in three samples of gold out of four from a certain district, and this metal had communicated something of its negativness to the gold alloy.

Skey also discovered, in the course of his investigations, a hitherto quite unsuspected reason for not getting true chemical contact between the gold and the mercury in the ordinary furnace and the battery; for he detected the fact that the surfaces of native or artificially prepared gold, even of extreme fineness, energetically absorb sulphur, or sulphureted hydrogen; and that when the surfaces of the particles of gold are so affected, they absolutely fail to have contact with the mercury, and are not amalgamatable, but that they may be made so by treating with cyanide of potassium, free chromic acid, chloride of lime, or by raising their temperature to a red heat. There are, however, certain specimens of native gold exceeding pure which show no disposition to amalgamate on contact with mercury; nor does boiling water facilitate it in any degree, although the specimens may be free from any discernible ferruginous or other stain. In many cases the obstacle is sulphur, most probably existing in combination with gold, as an auriferous sulphide. Sulphureted hydrogen is too common a substance, or at least the materials required for its generation are too common, to allow the hope that our native gold has not been more or less affected and rendered to a greater or less extent unamalgamatable.

Metallic Antimony

Has a great affinity for gold, and forms an alloy with it when the two metals are melted together, or when the vapor of antimony is passed over heated gold. This alloy is gray in color and very brittle, and amalgamates with mercury only after long contact and continued grinding; or by heating the two together, and the amalgam when formed floats on the mercury, and gradually gives up metallic antimony as a fine powder when agitated in water. This antimonial powder carries off a quantity of mercury and gold amalgam entangled with it.

Antimonial sulphide is perhaps the worst mineral to "flour" mercury that the miner has to deal with, but antimonial oxide has no effect on mercury or amalgam.

Gold and Arsenic.

Gold, alloyed with arsenic, is difficult to amalgamate, and when alloyed, in proportion of one part arsenic in 1000 parts of gold, the alloy is so brittle that it may be ground to a gray, easily fusible powder. If there be much arsenic present, the amalgam is powdery and black, and floats on the surface of the mercury; the black color is due to the operation of the arsenic, which, at ordinary temperature, does not unite with the mercury, but floats and "flours" the mercury. The arsenic from mispickel, or any of its numerous combinations with iron, cobalt, nickel, silver, copper, manganese, antimony, and with even lead and lime, may be set free in the roasting furnace, and pass through the furnace as a vapor, and be readily taken up by the gold that may be present, and thus prevent the amalgamation of the gold, providing sufficient heat is not then applied to this alloy to break up the later combination. Arsenical pyrites act seemingly in the same way as metallic arsenic with mercury; for when ground together, a large amount of black "floured" mercury is produced; and if

the pyrites is partly decomposed, this action is more energetic than with the original mineral, and amalgamation prevented.

Lead, Iron and Copper.

Metallic lead has a highly detrimental effect upon the amalgamating process, as it causes a loss of gold amalgam and mercury by the lead amalgam arising to the surface of the mercury, as a frothy scum, carrying with it any gold amalgam that may be present, and by coating the mercury and preventing it taking up the gold; besides, this floating lead amalgam is easily carried off in a fine state by a current of water. Although zinc is taken up by gold at a dull red heat and forms a brittle alloy, the combination is easily broken as in arsenic, and the gold amalgamated.

Iron has no effect ordinarily upon amalgamation; but if the mercury contains one per cent of sodium amalgam, it will decompose iron salts and produce iron amalgam, which will float upon the surface of the mercury and be carried off in a current of water, and take with it such gold amalgam as may be entangled with it.

Copper is not injurious to the operations of recovering gold from pyrites, except in reducing the standard of the gold with which it is alloyed; and upon the other hand by becoming amalgamated with mercury, it may assist in collecting the fine particles of gold in the same way as amalgamated plates. In fact, the presence of galena, blende, manganese, arsenic, iron and copper pyrites do not interfere with oxidation while roasting if a proper furnace be used, and the ore properly pulverized before it is roasted. Even tellurium, with its combinations and its alloys, which baffles the efforts of the miner to make the gold amalgamate when it is present, gives way in the roasting furnace; and the gold is denuded of its coating of tellurous acid and rendered easily amalgamatable.

Loss in Furnaces.

There is a great loss of gold in working ore that has not been thoroughly desulphurized in the roasting furnace, and to accomplish this desulphurization the rock should be finely pulverized at the start; for if a large piece of quartz containing pyrites and gold be submitted to a low degree of heat, the pyrites in the interior of the quartz is but little changed; while the free gold is coated with a film of some material, probably sulphur, which impedes the action of the mercury. At a higher degree of heat the oxide of iron forms on the exposed faces of the quartz, and acts as a flux, and glazes the surface of the quartz with a slag; in this glazing of slag or glass, minute globules of gold may be discerned, and in the black veins, running through the partially desulphurized quartz, will be found the melted mono-sulphide of iron, in which is a diffused portion of the melted gold, but in a form more difficult to separate than before the rock was roasted. If the quartz is heated to a high degree of heat, and suddenly thrown into cold water, it is rendered more friable and soft, and the gold changed in form, from the jagged or laminated to a spherical shape, and enabled to sink more quickly to the mercury; but outside of this there is no advantage to be gained by the cold bath. To avoid the loss attendant upon incomplete desulphurization, and secure complete and rapid oxidation of the ore, it is found necessary to crush the ore dry, to a uniform fineness, of from 1-40 to 1-60 of an inch in diameter, and roast it afterward, although, owing to the faulty construction of the furnaces, and the great loss of fine gold in being carried off by the draft in the flue, the ore has usually been coarse when roasted, especially as hitherto it has been thought that the construction of the furnace has had but little influence on the chemical results of roasting. Economy of fuel and the mechanical devices for stirring the ore have been of more interest to mine-owners than a study of the chemical combinations produced by admitting the gases and flame of the fuel to come into contact with the ore while roasting. The loss of fine gold in the flue has created more mental disturbance to the average furnace-man than the loss of gold caused by the forming of new bases and the coating of the gold by alloys formed in the furnace, for the reason that it has been better understood and more easily guarded against.

The Russell Furnace.

A furnace has been invented, and recently patented, by Dr. E. F. Russell, of San Francisco, that admits of no loss of gold, by either chemical combinations from the contact of the flame and the ore or from having gold carried off in the flue. The ore is roasted by radiated heat, and the gases and flame from the combustion of the fuel are absolutely prevented from coming in contact with the ore; the draft of the flue does not touch the ore, and there can be no loss of fine gold from that cause.

This Russell furnace is constructed in such a manner that from 5 to 20 chambers (made of fire-brick) cross it from side to side, and the open ends of these chambers are closed by doors from the outside. Each of these chambers gives a floor surface of 24x96 inches, and will take a charge of from 250 to 500 pounds, dependent upon the character of the ore. In the arched top of each chamber are escape-holes for the gases given off by the pyrites in the course of roasting. If the ore be heavily charged with sulphurets, and placed in the roasting chamber, it furnishes means within itself to materially assist in the oxidation; for the pure atmospheric air, coming through the not over-tight doors (at the open ends of the

chamber), is brought in contact with the mixed gases given off while the ore is being roasted, and furnishes all the conditions for the rapid combustion of the sulphur. The excess of gases passes through the escape-holes into the flue and is condensed in their passage to, or in, the large combustion chamber, constructed at the rear of the furnace. If it is found that it is advisable to save any volatilized minerals present in these chambers, they can be drawn to condensing tanks and there saved. The flame passes above, below and all around these roasting chambers, but never into them. The inventor took advantage of the fact that "nature abhors a vacuum," and thus secured a most remarkable draft for this furnace. He placed a large combustion chamber at the rear of the furnace and made the exit for the flame a few inches below the level of the grate-bars, in the fire-box, at the front of the furnace. The practical results were dual, for it not only banked the heat against the rear of the furnace and made these back chambers almost as hot as those situated near the fire-box, but the superheated air, rushing from the combustion chamber into the stack, created a vacuum which nature could only fill, by forcing cool air (under atmospheric pressure), through the grate-bars and fire-box. Through this unique construction of the Russell furnace, the fuel is fully utilized and the gases consumed; and it is claimed by the inventor that a saving of 60 per cent is made in fuel over any other furnace that is used to roast ore upon a large scale.

The Action of this Furnace

Seems to be simply as follows, viz.: As the ore in the charged roasting chambers begins to roast at a low heat, the sulphur of the pyrites is set free, and combines with the oxygen of the air to form volatile sulphuric acid gas; and the metals, by losing part of their sulphur, are converted into oxides and sulphates; as the heat is increased, the sulphates are changed into oxides. Arsenious acid and sulphuric acid escape with such metals as have become volatilized under the action of the intense heat and oxygen, and all metallic iron is converted into an oxide. As no gas nor flame from the combustion of the fuel is permitted to come in contact with the ore when undergoing these rapid changes, it is not fluxed, slagged or matted, and no new base is formed, and the whole mass is soon thoroughly oxidized. After the sulphur and arsenic have been thrown off (provided salt has not been used), the gold remains free, and may be washed out.

When salt has been used below a red heat, the chloride of gold is made, but above that point it is converted again into metallic gold. Technically speaking, the arsenic is converted into arsenious oxide (As_2O_3); the sulphur into sulphur dioxide (SO_2); and the iron into ferric oxide (Fe_2O_3).

It may be readily seen that in such a furnace the sulphur and arsenic in the pyrites take fire, and are converted into dioxide and arsenious oxide at the expense of atmospheric oxygen, and pass away together through the escape-holes in the arched top of the roasting chambers into the flue.

With this knowledge before us, we may summarize in a few words the necessary requirements to extract gold from refractory ore, and successfully amalgamate the gold and silver. Summary: Pass the ore through a rock-breaker, and over a drying floor, and then crush it dry, and pass it through a screen of 40 mesh to the inch, and then roast it in a Russell furnace, and thoroughly oxidize all the minerals in it, as the oxides do not interfere with the action of the mercury. Pass this desulphurized material into an ordinary combination pan, and grind it a short time and amalgamate the precious metals, and then run the pulp into settlers and save the amalgam and re-tort it.

This process is a remedy complete in its action for the loss of gold in the battery, (when the ore is wet crushed) and by non-amalgamation, after roasting in the ordinary furnaces in use. And if the different steps of the work be faithfully done, the result will prove as satisfactory to the mine-owner as his assay of the ore from the mine.

Oakland, Alameda Co. E. T. BARBER.

SANTA ROSA TO BENICIA.—George W. Walts, formerly of the Union Pacific, has secured the contract for the construction and thorough equipment of the proposed Santa Rosa & Benicia Central Railway. The new line is one which the farmers and fruit-growers of the Sonoma valley have been working for during the past year, and is intended as a "short cut" for the shipment of their products to the Eastern market. Beginning at Santa Rosa, the route surveyed runs to Glen Ellen, at the northern terminus of the Sonoma valley line, and thence to Sonoma. It will then pass southeasterly into Napa county, and continuing in the same direction, will go through the town of Vallejo, and on to Benicia, where it will connect with the Central Pacific. Mr. Walts left the city for Santa Rosa last week, and on Monday morning, with an engineering corps of which Lyman Bridges is chief, he proceeded to locate the line of the route. The work of construction was also commenced on the same day, a force of graders and track-layers having already been engaged. The cost of the line with its equipment is estimated at \$2,000,000. It is the intention of the contractor to have the new railway completed and in running order this year.

Saving Floured Quicksilver.

Results of the Tests of the Rae Process.

From the Dayton News Reporter we take the following interesting description of the recent tests of the Rae process, at the Douglass mill, of which we have spoken several times of late:

The Rae electric process has received a thorough practical test, and has been proved a grand success. It has been demonstrated beyond a doubt that by means of that process tailings and low-grade ores which before could not be worked except at a loss can now be worked at a profit. The result will be of almost incalculable value to the mining industry, and to this section of the country it will be especially beneficial. The time is not far distant when the process will be used in all reduction works. Below will be found Supt. Rullison's report of the test recently made at the Douglass mill:

Upon the 8th day of February we commenced running three pans and settlers with Dr. Rae's electric attachment and one pan and settler in the old method (without electricity), first having taken all four of the pans and settlers to pieces and thoroughly cleaning them. We run the mill on those pans and settlers alone, stopping all the other work, in order to be certain to not get anything mixed. We selected our best workmen, and all the quicksilver used was carefully weighed out for each system separately.

Dr. Rae, after adjusting the brushes on the dynamo, placed the test in my charge, saying: "Give me a fair, just and honest deal." Some of the men were very skeptical, but all worked for a fair test. Upon the start, No. 1 pan and settler were used the first two days on "green slimes" and "slums" that had never been plowed or scraped, and no sand having been mixed with them. With Nos. 2, 3 and 4 the regular prepared slimes and slums, with sand, were worked. Nos. 1, 2 and 3 were the pans and settlers connected with the electric system. No. 4 was run in the old way.

After running four charges of the "green slimes" and "slums" through No. 1 pan and settler all these, we found that, to all appearances, the electricity worked equally as well on the "green" stuff as upon the prepared material. Assays were taken from each settler as soon as it was filled, and also when the settlers were discharged. These assays showed a large percentage of saving of bullion by the electric settlers over settler No. 4, the old method. After the first day the assays from the settlers, taken when first filled, showed a marked decrease in value in comparison with settler No. 4, thus proving that the action of the electricity was affecting the bulk of quicksilver, rendering amalgamation more perfect in the pans.

The quicksilver returned from the settlers Nos. 1, 2 and 3 was bright, lively and healthy, apparently free from iron and scum.

I would remark that on the fourth day the No. 4 settler showed that it was being benefited by the others. This was easily traced to the ground currents from Nos. 1, 2 and 3 settlers.

During the seven days' run, pannings were made from all the settlers, which showed the superiority of the new method.

The sluice-boxes were so arranged that two sluices were given exclusively to Nos. 1, 2 and 3 settlers, and two sluices to No. 4 settler. A daily examination of sluices after each draw-off, exhibited the fact of the success; while scarcely a trace of floured quicksilver could be noticed on the Rae sluices, the No. 4 sluices showed plenty as usual.

During the run, 1672 pounds of quicksilver was used in Nos. 1, 2 and 3 settlers on 52 tons of material worked, and 1655 pounds was returned back, showing a loss of 17 pounds, or about five ounces to the ton. No. 4 used 650 pounds of quicksilver on 17 tons, and 616 pounds was returned back, showing a loss of 34 pounds, or two pounds to the ton.

Strict attention was paid to assaying the pulp, as delivered from the pans to the settlers, and when the settlers were discharged. The bullion returns were as follows:

	Old Method.	Rae Method.
No. of tons.....	17	52
Ounces of bullion.....	611.50	1219.80
Fineness.....	62-1000	115-1000
Value.....	\$41.09	\$181.38
Increase of bullion production, per cent.....	47.11
Increase of fineness of bullion.....	63-1000
Fineness of gold returned.....	3-1000	4-1000
Gain on returns of gold, per cent.....	33.33
Saving of quicksilver, per cent.....	83.33

This test was made by daylight, in order to guard against any mistakes that might occur during the night, and also to make it possible to give it my personal attention.

In conclusion I unhesitatingly pronounce the trial a most perfect and emphatic success.

WM. A. RULLISON,
Superintendent and Assayer of J. M. Douglass & Co.'s Mill.
Dayton, Nevada, Feb. 21, 1887.

A SCIENTIFIC CURIOSITY.—One of the curiosities of light and heat is the fact that rays of the sun should pass through a cake of ice without melting it at all, as is the case when the thermometer stands a little above zero. That the rays of heat actually penetrate the ice is shown by the fact that a lens of ice may be used for setting fire to inflammable substances.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPECTACLE-FRAME.—Wm. R. Johnston, S. F. No. 357,392. Dated Feb. 8, 1887. The invention consists in the novel means for adjusting the frames to any size of glasses and securing them. The object of the invention is to provide a simple, practical and finished means for adapting the frames to receive the different sizes of glasses, which means are of such a character as may be readily operated as well by those unfamiliar with the manufacture of spectacles and eyeglasses as by those who are familiar.

WATCH-CASE.—Julius C. Landmann, Eureka, Nev. No. 357,395. Dated Feb. 8, 1887. This case is more especially designed to protect the movement of the watch from injury should it be dropped. It consists of an interior inclosing case for the movement, this case being of smaller diameter than the ordinary exterior case, so as to admit a spring between the two, by which any accidental jar upon the exterior case will be prevented from acting violently upon the movement.

BALANCED SLIDE-VALVE.—Andrew J. Stevens, Sacramento. No. 357,424. Dated Feb. 8, 1887. This invention consists of a valve sliding upon the valve-seat, and having, in addition to the usual steam exhaust cavity or cavities, an auxiliary passage passing through it for the steam supply and exhaust purposes, according to the position of the valve, and, in connection with this valve, of a shield or balance-plate and an oval balance-ring fitting between the upper side of the valve and balance-plate. The patent also covers certain details of construction.

EVAPORATOR.—Wm. F. Lambert, S. F. No. 357,775. Dated Feb. 15, 1887. This improvement in evaporator consists of furnaces for heating the air, means for conveying it to the chamber where the drying is to take place, and applying it to the hollow shelves, supporting the material to be dried or evaporated, a device for regulating the temperature of the air before it is admitted to the chamber, and a means for returning the air again before it has passed through the chamber to be again reheated. Certain details of construction are also covered by the patent.

ADJUSTMENT FOR HARVESTER REELS.—Joseph Gilbert, Los Angeles. No. 357,822. Dated Feb. 15, 1887. This patent covers a mechanism for adjusting harvester reels for use in high or low grain. By the construction adopted the reel is within easy reach of the driver, and it may be changed at any time to suit the character of the work to be done. Its movement is much greater than when the ordinary crank arms are used for raising and lowering it, and the arc of a circle through which the rear end of the lever moves is not great enough to interfere with the movements of the chain around the pulleys.

HOEING AND RAKING MACHINE.—David Lubin, Sacramento. No. 357,841. Dated Feb. 15, 1887. This is an apparatus for working and cultivating the soil. It consists of a series of arms, carrying at their outer ends blades or hoes, and a mechanism by which these arms are raised and caused to strike on the ground forcibly in the manner of a hand-hoe, and be moved backward at the same time, so as to move and cover up that portion of the soil which they have cut off. This device is mounted upon a wheeled carriage so as to be drawn over the ground; and in connection with these hoes is a mechanism for operating them.

FILTER.—Anthony McLean and Findlay Camming, S. F. No. 357,402. Dated Feb. 8, 1887. This is a filter to be attached to ordinary pipes or faucets for the purpose of clearing water to be used for household or other purposes, from the larger and heavier impurities. It consists of a means for readily cleaning the exterior of the cylindrical filtering column which is employed in the device. This is a band, or series of bands, suitably united, surrounding the filtering column, which it fits sufficient to rub upon the outside. It is provided with a rod or handle by which it may be moved up or down whenever it is desired to cleanse the surface.

SPRINKLER.—Wm. Wainwright, S. F. No. 357,799. Dated Feb. 15, 1887. This is a sprinkler for hose nozzles. It is so made that the stream emerging from the nozzle-top strikes a plate or flange at a suitable angle, and is thereby broken up and spread out in the form of a spray or sprinkle. The angle at which the stream meets the plate or flange may be varied by the adjustment of the latter. The limits of this adjustment are determined by a thumb nut and lever or handle. The flange may have its angle varied rapidly by means of the thumb of the person operating it, and said plate may, if desired, be thrown back at will out of the way, to permit the unobstructed play of the stream.

VAPOR-BURNER.—Wm. Wainwright, S. F. No. 357,798. Dated Feb. 15, 1887. This in-

vention relates to the class of burners which are used for burning the vapor arising from the lighter or more volatile oils, such as gasoline, naphtha, etc. The patent covers the construction and combination of devices. The adjustment to regulate the amount of flame desired is accomplished by increasing or decreasing the distance between the point of ignition and the top of the wick. Thus, when the burner is moved down a greater heat is thereby obtained, which generates more vapor, and causes an increase in the body of the flame, and when the burner-tube is raised there is less heat and consequently less vapor generated, and the size of the flame is thereby reduced.

PHOTOGRAPHIC CAMERA.—Oliver Hyde, Valjeo. No. 356,941. Dated Feb. 1, 1887. This camera consists of a case having three horizontal compartments, the central one of which contains the lens, plateholder, and bellows for observation; the upper compartment containing a magazine for plates, and the lower compartment another magazine for the reception of the plates after the picture has been taken, and, in combination with this, a mechanism operated from the exterior of the case whereby the focus is adjusted and the magazines moved so as to adjust the plates in position for pictures to be taken, and remove them into this receiver below without opening the box at all.

HARROW.—David Lubin, Sacramento. No. 357,151. Dated Feb. 1, 1887. This improvement in harrows consists of a combination with the harrows having fixed teeth, of one or more series of radial spoked wheels mounted upon an axle or axles extending across the harrow frame, so that the wheels may rotate between the lines of the harrow teeth. This construction resembles in some of its features the arrangement shown in former applications by the same inventor, but it differs essentially from those in being made applicable to an ordinary harrow composed of longitudinal and transverse frames with a series of fixed teeth, and by the arrangement for combining the rotary spoked wheels and lifting fingers with the same.

CLOD CRUSHER.—David Lubin, Sacramento. No. 357,844. Dated Feb. 15, 1887. This consists of a series of disks, either plane or toothed, mounted upon a horizontal axle, and, in combination with these, of a series of arms or fingers projecting down in front of or behind the vertical plane of the axle, so that their points will enter the ground and at the same time serve in connection with the teeth or edges of the disks to crush and break the clods which may be taken up by these fingers. Connected with these fingers is a mechanism, either automatic or otherwise, by which the teeth may be raised out of the ground or disengaged, so as to clear them of stones, trash, or other obstructions, which may be picked up as the machine travels, and afterward returned to the working position.

CLOD CRUSHER.—David Lubin, Sacramento. No. 357,843. Dated Feb. 15, 1887. This is another improved device for breaking or disintegrating clods or masses of earth, and working or reducing the same. It consists of a series of disks or rollers, which may be fastened solid to the shaft, or may be arranged to work independently, having their peripheries provided with teeth or points which will enter the ground, or formed with a sharp edge or edges, which will act as a cutter or crusher, and, in connection with these, of a series of arms projecting from between the disks and fulcrumed upon the axle or shaft of the frame, so that they may be turned to present their points toward the front or direction in which the machine is traveling, or may be reversed, so that the curved points will enter the ground and be drawn along in this position following the disks or rollers, and acting as a harrow, leveler or cultivator, and to cover seed.

CLIP FOR WIRE-ROPE WAYS.—A. S. Hallidie, S. F. No. 357,664. Dated Feb. 15, 1887. This invention relates to a means for attaching the conveyor or carrier of an endless-wire ropeway to the traveling wire rope, the same being employed as an aerial ropeway. It consists of a clip formed by inserting a short bar or shank within the rope in place of the central core, and a thin plate secured to said bar and extending outward through the space between two strands and reinforced or strengthened so that the bucket or conveyor may be attached to this plate and suspended from the rope. This invention is designed to be used in connection with what are known as aerial ropeways, and it is designed to take the place of the band connection or clamp which has hitherto been used to attach the hanger, by which the bucket or carrier is supported, to the traveling rope.

CLOD CRUSHER.—David Lubin, Sacramento. No. 357,842. Dated Feb. 15, 1887. This clod crusher consists of a series of adjustable arms or lifters supported from a suitable fulcrum or an axle, which is journaled on a suitable frame-work, and, in combination with these arms or lifters, of a series of independent disks or wheels, having arms or teeth projecting from their peripheries, these disks turning about a shaft or axle extending across the frame and moving between the arms, so that any lumps or clods which are brought up by the arms will be broken by the action of the teeth striking against the clods, which are expounded temporarily by the bars upon each side while the

teeth pass between them. In connection with this, the inventor shows in his patent the preliminary cultivator and levers, by which the cultivator may be raised or depressed, and also by which the lifting arms may be raised or depressed.

WATER-WHEEL BUCKET.—Louie Biggio, Sutter Creek, Amador Co. No. 356,977. Dated Feb. 1, 1887. This invention relates to that class of water-wheels which are operated by means of the impact of a stream of water issuing from a nozzle under head or pressure against suitably formed buckets secured to the rim or periphery of the wheel, said wheel being usually known by the name of burly gurdy. The patent covers "a water-wheel bucket, the cavity or face of which is provided with a central perpendicular ridge extending from the base upwardly part way of the height of the bucket, said ridge being wider at the bottom than at its top, and having its apex tapering and gently curved for receiving the impact of the stream, and lateral tapering ridges extending from the top part way down and on each side of the central ridge." Concentric corrugations are formed in the depressions on each side of the base of the central ridge.

FOG-HORN.—George White, S. F., assignor of one-half to E. H. Backnam, S. F. No. 357,802. Dated Feb. 15, 1887. This fog-horn is designed for use on vessels in foggy weather. It consists of a chamber having a mouthpiece at one end, an organ or other reed adjustably fitted to the opposite end, and an intermediate chamber or chambers with tortuous passages and screen openings through which the air reaches the reed from the mouthpiece, and in connection with this of a secondary perforated chamber, which may be filled with epaço or other porous moisture-absorbing material. In the construction of horns of this class it is usual to fix a reed directly inside the mouthpiece, and a reed thus placed is subjected to the action of a great amount of moisture from the breath, which is apt to corrode, and is also very apt to become clogged on account of the propensity of sailors to chew tobacco, particles of which become blown into the reed, thus preventing its action. In order to protect the reed from these difficulties, this inventor places it in a chamber situated at a considerable distance from the mouthpiece.

PROGRAM ALARM CLOCK.—Ellen Cushing, S. F. No. 357,373. Dated Feb. 8, 1887. This invention consists in connection with the clock-work mechanism which operates the hands and the alarm, of a rotating drum, wheel, ring or band, provided with removable or adjustable pins adapted to successively come in contact with a mechanism by which the alarm is rung. More particularly the invention consists in a drum having an hourly period of rotation and provided with holes or sockets arranged in rows in horizontal and vertical planes, removable pins fitted to these holes, a pivoted standard, by the partial rotation of which the alarm is operated, a sliding sleeve on said standard, and carrying an arm with which the pins of the rotating drum successively come in contact, whereby the standard is partially rotated, came on the drum for hourly raising the arm of the sleeve into position for the engagement of the pins of each row, a means for throwing the alarm out of action and bringing it into operation again, and various details of operation. The object of the invention is to provide a clock which is capable of sounding a number of successive alarms during any given period, said alarms taking place at equal, or at unequal or irregular intervals, as may be desired. It is especially adapted for use in school-rooms, where the hours are divided into stated periods for accomplishing certain work. These periods are ordinarily defined by a hand-bell operated by the teacher or by some monitor appointed for this purpose. The limits of the periods are therefore liable to be inaccurate; but with this improved clock this difficulty is obviated, and the burden and responsibility are removed from the authority having the regulation of the time.

THE COOS BAY COAL MINERS' STRIKE.—In regard to the strike of the Coos Bay coal miners, the manager of the company in this city says that about six weeks ago they concluded to advance the price of their coal in this city to wholesalers from \$5 to \$5.50 per ton. The miners at Coos Bay thereupon demanded that the 50 cent increase be divided with them and demanded \$1.25 a ton for all they got out. On being refused, the men, 90 in number, went out on a strike. The price of the coal since the strike has been put back to the original price of \$5. The company has not determined whether it will resume work at the mine or shut down for good. They claim expenses are high and profits small. The miners at the price paid, \$1 a ton, can easily make, they claim, \$4 a day.

A MINING SUIT DECIDED.—The Supreme Court has confirmed the judgment of the lower court in favor of the plaintiffs in the case of William Tredinnick and 29 others against the Red Cloud Consolidated Mining Co. The suit was to enforce liens for labor everlastingly performed by the plaintiffs upon a mining claim in Mono county. Henry Wadsworth was joined as a defendant in the action, because he had a judgment lien against the mine, which, it is alleged by the plaintiffs, was subsequent and subordinate to their liens.

El Dorado's Mineral Resources.

It is well known that El Dorado county was for a number of years, says the Placerville Observer, the banner placer diggings county; her product of gold running up into millions upon millions annually. These rich diggings were not confined to any special locality, but extended clear across the county, and the belt in width ranged from 20 to 40 miles. In those days nothing but surface and river diggings were known, and when the claim had been partially worked off, so that a miner with the crude facilities then in vogue could not make over \$10 or \$15 a day, the claim was abandoned and fresher and more inviting fields sought. Later on these abandoned claims were relocated and worked as long as they would pay from \$6 to \$10 per day, and then sold or abandoned again. Later on these were again relocated and with improved methods and appliances were made to yield handsomely, and so it has gone on up to the present day, until there is now very little surface ground left that can be profitably worked. But we have yet unlimited deep gravel deposits that are rich in gold, as well as untold rich quartz veins, which have already been made to give up many millions of treasure.

Albeit many of our best quartz mines have been sadly mismanaged, and a great deal of money needlessly squandered by incompetent superintendents and managers. As it is, we have to-day but few good-paying mines, and they are in the hands of private individuals or close corporations, and little is said or known about them beyond the knowledge that they are good-paying properties.

We have a number of partially developed quartz mines, that for the work done promise well, and good round prices are asked for them, while the development is not sufficient, as a rule, to warrant the prices demanded. We have plenty of good miners in our midst, capable of taking hold and superintending any kind of a mine, and who are capable of making economical and practical tests of mines, and if capitalists would, instead of paying high prices for shafts and tunnels, with indifferent prospects, purchase a few undeveloped or partially prospected mines, or bond them, have them economically and intelligently tested by our practical miners, instead of sending some impractical squirt, with Colonel or General prefixed to his name, from New York or Boston or some other seaport, who never saw the working of a mine until his arrival here, to superintend them and fool away the money intended for legitimate work, they would be sure to get an occasional good mine at much less expense than has been their usual experience.

Grizzly Flat, some 20 miles east of Placerville, is to-day a more promising field for the judicious investment of capital in legitimate mining than can be found in the same extent of territory anywhere else in the State. And the same can be said in regard to El Dorado and Georgetown, and but two or three years, at most, can elapse, even with present rate of progress, before capitalists will be astonished that they did not sooner recognize the wealth of these localities, and secure a goodly share when it could be had at nominal figures. Of course every prospect-hole does not constitute a mine, but good mines are discovered by first sinking prospect-holes, and developing only those that prospect well; but, unfortunately, too much money has been heretofore lavished upon insignificant prospects, all over the county, in some instances with a view to catching greenhorns and realizing handsomely, which in a number of instances has proved a success, but to the detriment of our best mining interests. But this matter is becoming better understood, and we are confident that it will not be long before a tide will set in that will fully demonstrate the fact that we have as good quartz mines, and more of them, than are to be found anywhere in the world.

In the immediate vicinity of Placerville, at no distant day, a dozen good quartz and gravel mines will be developed and operated, which, together with the deep gravel belt in its entire extent, will give employment to at least 1000 miners.

In the vicinity of Georgetown and Greenwood, and all over the north side of the county, is as fair a field for the development of good mines as is to be met with anywhere on the coast, and the same can be said of all that portion of our county south west from Placerville, in the immediate vicinity of Diamond Springs, Nashville, El Dorado, Shingle Springs and Clarksville, and in fact we know of no section of the county where good prospects in quartz mining cannot be found; but considerable capital, hard work and good judgment are required to open them up, and this is necessary in any enterprise of similar magnitude. These interests are yet really in their infancy, but can remain so but a short time now, as the fact is becoming so generally known that what we have claimed for years is a veritable fact, that our mineral belt is teeming with hidden treasure. The enormous quantities already secured, the good and permanent mines now developed and working in all directions, and the large extent of country open to prospect and development, all clearly point in this direction.

Had the capital been employed here that was put into the Black Hills, in Leadville or Tombstone, the results there would appear insignificant compared with the results that might have been, and will be, achieved here.

Passing Events.

The ditches bringing water to the Grass Valley mines are again open, so that mining operations are once more in progress. The ditches became blocked with snow, and for some three weeks several mines have been idle.

A great many immigrants and tourists continue to come to California, and lands, especially in the southern part of the State, are being rapidly settled up. Real estate is advancing in price in many of the interior towns, and general prosperity prevails.

It is now thought that with late spring rains California will have one of her most prosperous seasons this year. The rains which have fallen of late have been warm, and heavy crops are expected all over the State.

It is thought that there will be renewed vigor in the working of quartz mines in California this summer. Many old ones will be reopened and a good many prospectors will be on foot. Mines that not many years ago were considered worthless can now be made to pay. We have more experience, better appliances and better conditions for working than formerly.

There is a rumor in this city that the Providence mine, Nevada county, has been sold in London for \$1,400,000. The sale of this mine has been pending for some time in the London market. Whether the rumor of this sale is correct or not, we are unable to state.

CHIEF JUSTICE MORRISON, of the Supreme Court of California, and Samuel Bell McKee, who was until a short time since one of the Supreme judges, both died this week.

Celestial Photography.

Just at present celestial photography is attracting much attention among astronomers. It is one of the most important of the many methods used to further our knowledge of astronomy. The Lick telescope is to be provided with an extra lens to correct the great objective for the photographic rays, and when complete, it will stand without a rival worthy of the name. Prof. Holden has intimated that at least a part of the time of the great telescope will be devoted to this comparatively new method of observation.

The first successful attempt to photograph a heavenly body was made by Dr. J. W. Draper, in the State of New York, in 1840, when he succeeded in photographing, or rather daguerreotyping, the moon. Bond, of Cambridge, 10 years later, also succeeded in obtaining an image of this moon by the same process, but nothing of any great value was accomplished for another decade. In 1864, Dr. Rutherford, of New York, photographed the moon with such success that the photographs, even at this time, are the best extant, and are being sold for the benefit of the Bellevue Hospital, in New-York City.

While the American astronomers claim the honor of originating this new and now powerful aid to astronomy, France and England are leading the world in this particular method of research. The Henry brothers, of Paris, have thus far obtained the most marvelous results, with perhaps the single exception of Mr. A. A. Common, of England, who succeeded in obtaining a wonderfully correct picture of the great nebula in Orion. The instrument used by Mr. Common is a silvered glass mirror of 36 inches aperture, while the telescope used by the Henry brothers is of 13 inches aperture, and was constructed by themselves for this special work.

One of the greatest obstacles to be overcome in this new method of astronomical science was purely a mechanical one. The most sensitive photographic plates require an exposure of about an hour for faint objects, and the difficulty of keeping the telescope moving at the exact rate that would just counteract the diurnal motion of the earth, and keeping the telescope pointed at precisely the same part of the sky for this length of time, requires the most elaborate mechanism. To illustrate this difficulty, it may be said that the image on the photographic plate of one of these very faint stars is only about 1-1000 of an inch in diameter. To obtain the image of these faint points of light, it is sometimes necessary to give an exposure of 1½ hours, and the motion of the telescopes must be uniform in "following" the star, that the motion must not vary even the 1-1000 of an inch, or a star giving such a faint light would not or could not be photographed at all.

Just here is the great secret of the success of this new method. The photographic plate may be exposed steadily for an hour or more, and the light of a star, so faint that it would never be perceptible to the eye, will register itself upon the abnormally sensitive plates now in use, and thereby bring to our knowledge the existence of millions of stars that could never be seen with the instrumental aid we have at present. Of course the exposure necessary to photograph a star varies with the brightness, and, in some measure, the strength of the actinic rays of the star. It has been estimated that the bright stars Sirius and Vega can be photographed in the 1-200 part of a second with a 13-inch telescope.

The actual results obtained are of the most astonishing character; and only those who are familiar with the subject can fully appreciate them. It is said the eminent astronomer, Wolf, worked several years to construct a chart of the little cluster known as the Pleiades—familiarily known as the "seven stars"—and he succeeded in mapping 671 stars down to the 13th magnitude. This cluster was photographed in the same observatory, the photograph being on the same scale as the chart, and, although the photograph required but an hour's exposure, it exhibited 1421 stars down to the 16th magnitude, and the telescope used for photographing the cluster was much smaller than the one used in making the chart.

The planets have also been photographed. The planet Neptune, and his satellite in different parts of its orbit, were photographed, while the larger observing instruments of the same observatory would not show it at all.

While the Paris photographs of certain regions showed an average of 55 stars to the square inch, the more recent negatives of the same regions obtained by Mr. Isaac Roberts, with a 20-inch reflector, showed an average of 91 stars in the same area, the scale being the same.

What may we expect with the giant 36-inch lens of the Lick telescope? He would indeed be a bold astronomer who would dare set the bounds to which this powerful instrument can penetrate. It will now be only a few months until the Lick Observatory will be in full working order, and until then we must possess our souls in patience.

There is Ever a Famine of Gold.

We hear a good deal just now about the present being an era of overproduction—the markets of the world being glutted with many of the staples of use and subsistence. There is being manufactured or otherwise produced, we are told, more of these commodities than can be consumed, or at least profitably disposed of. We mine too much coal, iron, lead and copper; make too much pork, lard, tobacco and whisky; raise too much farm produce, and manufacture too many articles of various kinds. Such is the plaint of the political economist of the day, and he may be right; but there is one thing, we can assure him, of which we do not make an overproduction, nor yet make half enough. No one complains that the crop of gold is, or ever has been, too large for the wants of mankind. There is, in fact, and ever has been, a dearth of this metal. It is the one thing that everybody wants and of which no one ever gets enough—the one thing that is never without a market at a fixed and remunerative price. Of silver there may, in the estimation of some, seem to be a plethora, but of this, the more royal metal, there is never by any supposed to be a surplus.

Now, while the population and the industrial products of the world have of late years been rapidly increasing, it is notoriously the case that the gold supply has at the same time been growing less year by year. That is to say, with a steadily diminishing supply of that metal the demand for it has at about the same ratio increased. Gold being the measure of values, if gold becomes scarce values decline. When values decline business becomes dull and markets stagnant, a condition of things that must inevitably ensue if the world's supply of gold is not soon augmented. A general shrinkage of prices tends to discourage enterprise, whereas advancing prices tend to stimulate and quicken it. As evidence of this truth we have the results that followed the discovery of gold in California, an event that produced a degree of commercial and industrial activity such as the world has never before seen.

As a means of averting the decadence that threatens the prosperity now so generally prevailing, the arduous resources of this and all other gold-bearing countries, wherein the conditions for utilizing this class of deposits are, as here, especially favorable, should meet with early and extensive development. Concerning the gold mines of California, their number, wealth and situation, investors are everywhere so well informed that we need not here enlarge on that point, further than to say the present annual production of these mines, amounting now to about \$16,000,000, might easily be doubled. The yearly output of our gold mines might, with proper effort, be advanced in the next decade to \$35,000,000 or \$40,000,000, and our men of large means will be consulting their own interests if they proceed to adopt measures looking to that end. Of the quartz mines in this State that might well attract the attention of capitalists, not one in ten has ever been thoroughly explored or equipped with plant. Of this class of properties that have been brought into a productive condition, nearly all are making satisfactory net earnings, not more than a few failures having occurred in this State for several years past. The odium that attaches to the business grew out of transatlantic concommated years ago, and not out of those of recent date. Gold mining, as now conducted in California, is as little tainted with fraud, and in every way fully as safe, as any other branch of business pursued either here or elsewhere.

The Italian earthquakes caused more death, suffering and damage than was at first supposed.

Steam Vessel Regulations.

As heretofore noted in these columns, at the recent session of supervising inspectors, a regulation was adopted requiring test pieces to be attached to every plate used in boiler manufacture. It is now learned that the Secretary of the Treasury refused to approve this, a fact that boiler-makers will be glad to learn. It would not, in any event, have had the desired effect, and would have been of annoyance to boiler-makers.

The Treasury Department has issued a circular, which states that, excepting in the case of a person who has had experience as a locomotive engineer or the driver of a stationary engine, no one can hereafter be appointed chief or assistant engineer without having first served three years in a subordinate position. Where these exceptions are noted, one year's service as subordinate will suffice.

Authority is given to the local inspectors to compel the use of lock-up safety valves on the boilers of any steamer whose captain or engineer is suspected of carrying more than the prescribed steam pressure on the boilers.

An important change in relation to pilots is as follows:

SECTION 24. Masters and pilots of steamers on lakes and seaboard are required to have their wheel chains move so that the wheel and helm shall move in the same direction, so that when the wheel is put to starboard the vessel's head shall go to port, and when the wheel is put to port the vessel's head should go to the starboard.

It is well, in this latter connection, to call attention to the fact that there is confusion concerning the term "helm," some persons thinking it to be the rudder. The wheel is one thing, helm another, and rudder another. The "helm" is really the tiller on the rudder head. By this new rule the wheel moves *with* the helm and throws the vessel's head in the opposite direction.

In yachte and small craft, using a tiller, when the order "starboard" is given, the helm is pushed over to the right, this action pushing the rudder over to the left, and turning the vessel's head to the left. By the new rule just adopted, steamers now do the same thing. That is, at the order "starboard," the wheel is thrown over to the right, carrying also the "helm" (or tiller) to the right, pushing the rudder to the left, and throwing the vessel's head to the left. Under previous rules, when this order was given, exactly the opposite direction was given to the *wheel* on steamers.

Wheels on sailing vessels and all craft generally, all over the world, have for years been worked just opposite to the method enforced by the new regulations. A "ship's wheel" is so rigged that when it is turned to the left, the vessel's head is turned to the left; and when turned to the right, her head is turned to the right. Therefore, when the order "starboard" is given, the helmsman turns the wheel to port, to bring her head to the left; and when the order "port" is given, he turns the wheel to starboard, to turn her head to the right. Of course the order is given for the "helm"—not the "wheel." By the new rule, however, when the officer says "starboard," it means both wheel and helm must go the same way. There will doubtless be accidents and confusion until the new order of things gets working well. Men who all their lives have been used to throw the wheel the reverse direction to the word of order, will find it difficult to overcome the tendency to do so still. The new rule for steamers, nevertheless, is exactly opposite to that in vogue on sailing craft and steamers of other nations the world over. It is probably adopted for the sake of uniformity and clearness, so that the word of command and direction of wheel conform. Some river steamers have long used the new system, and our local ferry-boats have always done so. Now everybody must do it.

BACK NUMBERS WANTED.—In order to complete certain files of the MINING AND SCIENTIFIC PRESS, we should be glad to get certain back numbers. Any one having any of the following numbers of the PRESS will please communicate with this office:

1569—Jan. 2d, 9th, 16th. Feb. 27th. March 20th. April 17th, 24th. May 1st. June 12th, 19th, 26th. 1576—Sept. 11th. 1566—July to December.

It is stated that parties are now at San Diego looking for an eligible location for the erection of smelting works.

Smelting Ores by Electricity.

In a large number of chemical and metallurgical processes, in which high temperatures are required and in which it is impossible on account of the nature of the operation to heat the materials by the direct action of the fire in a reverberatory or blast furnace, it is customary to treat such materials in closed crucibles or retorts. For example, the reduction of sodium, potassium and zinc, and the manufacture of aluminium chloride, are carried on in this way, but the method is troublesome and expensive. The labor of managing a large number of small retorts is alone very laborious. Messrs. Bradley & Crocker, of New York, about a year since devised a process which they sold the patent for to the Cowles Electric Smelting and Aluminium Co., of Cleveland, Ohio. The object of this invention was to overcome these difficulties and to obtain the heat necessary to carry on such operations by concentrating it just where needed, and to obtain higher temperatures than have before been reached in commercial processes. The invention is said to be applicable to a large number of chemical and metallurgical processes.

We have had an engraving made to show one form of the apparatus, representing a vertical, longitudinal section of a furnace; the electrical arrangements are shown diagrammatically.

The apparatus shown in the figure is specially designed to be employed for the reduction of sodium or potassium, and it consists of a hollow cylinder, *K*, made of a material which is a conductor of electricity. This cylinder is set at a slight inclination in brickwork, as shown. On the cylinder are two rings, *L* and *M*, of copper or other suitable metal. These rings fit the cylinder closely so as to make good electrical connection. To these rings are respectively connected two heavy strips of copper, *N* and *O*, which lead to the outside of the furnace. The cylinder, *K*, is provided at each end with covers or caps, *P* and *Q*. In these caps there are holes, *p* and *q*, closed by screw plugs. The door, *Q*, is also fitted with a pipe, *R*, to the end of which a condenser, *S*, is attached. In the brickwork of the furnace there are spaces, *T*, which may be filled with asbestos mineral wire or other suitable non-conductor of heat; or these spaces may be left empty, air being alone a very good insulator of heat.

In working this furnace for the production of sodium, the mixture of sodium carbonate, charcoal and chalk, usually employed in making sodium, is charged into the cylinder, *K*, through the door, *P*. The copper strips, *N* and *O*, are then connected respectively to the poles of a dynamo electric machine, *U*, by large copper conductors, as indicated in the drawing, and a current of electricity is caused to pass along the cylinder, *K*, from the ring, *L*, to the ring, *M*, the current being partly carried by the mixture contained in the cylinder, which mixture is a conductor by virtue of the carbon it contains, and partly by the metal out of which the cylinder, *K*, is made. These rings, *L* and *M*, distribute the current uniformly all around the cylinder. The dynamo, *U*, should be connected to give a current of great "quantity," and the conductors and strips, *N* and *O*, connecting it with the cylinder, *K*, being made of heavy copper have so that the electrical resistance of the iron cylindrical shell, *K*, and of the mixture it contains will constitute the greater portion of the resistance of the circuit, consequently almost all the energy of the current will be converted into heat along the cylinder, *K*, and since it is surrounded by non-conductors of heat, the heat will accumulate, and the temperature gradually rise until the heat consumed in the reduction of the sodium and lost by conduction through the walls of the furnace, equals the heat produced by the passage of the current.

The strength of the current, and consequently the temperature of the cylinder, *K*, may be regulated and maintained at the proper point by means of the switch, *V*, which governs the electro-motive force of the dynamo machine, by varying the resistance of the shunt circuit, which supplies the field-magnets, as shown.

The general method of carrying on the process is the same as in the process now commonly used for making sodium, and the sodium vapor produced by the action of the heat upon the mixture passes out through the pipe, *R*, into the condenser, *S*, of the well-known form

in which it condenses and collects. The temperature and action within the cylinder may be seen by taking out the plug in either of the holes, *p* or *q*. Fresh material is charged into the cylinder at the door, *P*, and residue is taken out through the door, *Q*. The charging and discharging is facilitated by the slope of the cylinder, and the process is continuous.

The temperature can be regulated, and the wrought-iron retorts will last a long time. Various forms of the furnace can be made. In making aluminium-chloride, the cylinder is made of graphite and is placed vertically. Other chemical and metallurgical processes can, it is claimed, be carried on by this invention substantially in the same manner as that described.

The Legislature.

The Stamp Act bill, which provides that each article made in this State shall bear the mark and address of the manufacturer, finally passed both houses, despite the great opposition made to it by manufacturers, on whom it is said to impose useless burdens. It is, of course, directed against the Chinese, but works hardship on all white manufacturers. The Board of Trade, Chamber of Commerce, Manufacturers' Association, as well as large numbers of merchants and other individuals, opposed

FURNACE FOR REDUCING ORES BY ELECTRICITY.

this bill, and a strong effort is being made to induce the Governor to veto it. Most manufacturing establishments in this State are working under difficulties as it is, and it seems impolitic to hamper them in any way.

As stated elsewhere in these columns, the bill appropriating \$60,000 for the support of the State Mining Bureau passed both houses.

The Senate has finally passed the Trademark bill, which provides that any trade union, labor association or organization may adopt and use a trademark and affix it to goods made by members, or to each box or package of said goods. It is also provided that the president or other presiding officer of any trade union, labor association or labor organization, organized and existing in this State, which shall have complied with the provisions of the preceding section, is authorized and empowered to commence and prosecute in his own name any action or proceedings he may deem necessary for the protection of any trademark adopted or in use under the provisions of the Act, or for the protection or enforcement of any rights or powers which may accrue to such trade union, labor association or labor organization by the use or adoption of said trademark.

The Steam-Boiler Inspector bill, which had been passed by the Senate in a modified form, was refused a reading in the Assembly. Notice of reconsideration was given, but it is scarcely possible it will pass this session.

This being the closing week of the session, a great deal of work has been done and many bills passed. A large majority are of little more than general interest to miners or manufacturers. It may be said that the miners were treated to much more consideration this session than they have been of late years. But the manufacturers are not fared well.

The Rae Process.

In another column will be found the results of the trials at the Douglas mill, Nev., with the electric system of preventing flouring of mercury and loss of amalgam, to which we have referred several times of late. The success of the experiments is a general topic of conversation among quartz and tailing millmen, and the *Virginia Chronicle* states that the process will be generally adopted throughout. That paper also says: "Experiments demonstrated that the saving in quicksilver alone equals about \$500 per month to each amalgamating pan, beside increasing the fineness of the bullion contained in the amalgam 50 per cent. The saving at the Douglas mill, where the electrical process has been permanently adopted, is nearly \$8000 per month, making it possible to convert low-grade tailings into bullion at a profit, which by the old method was impracticable."

In addition to what is said in the article on page 154, it may be stated that B. I. Torman, of the Little Bonanza mill, testifies that he watched closely and with great interest the Rae test, as reported by Mr. Rulison, and is thoroughly satisfied that it was an exhaustive test. He is convinced that the test is accurate and reliable.

The following employees of the mill of J. M.

Work for the Mining Bureau.

After a great deal of discussion, the bill appropriating funds for the maintenance of the State Mining Bureau has passed both houses of the Legislature and has gone to the Governor for signature. The amount asked for by the Trustees was \$120,000, which was finally cut down to \$60,000, though at one time it looked as if it would be even less than that. An important amendment to the original bill is that which provides that 50 per cent of the money shall be spent on work in the field.

The fact that this amendment was carried, and that certain opposition to any appropriation was developed, even among mining county representatives, prove what the Press has long maintained concerning the past method of conducting the Bureau. We have always thought that too much attention was paid to the museum feature, and too little to things of more practical value to the mining community. It has always seemed to the editors of this paper that there were many things that miners want to know, which the Bureau could find out for them by more field work, and that the gathering and publication of this information would be better for the Bureau and the miners than the mere collecting and cataloguing of rocks, ores and minerals.

It is pleasant to note that the present State Mineralogist realizes this want. In his report this year, the chapter describing work at certain mines, with tables of results of mining and milling, costs, yield, etc., is the most interesting one printed. There should be more of the same character of information. In the proposed field work, it is to be hoped a thorough investigation and report will be made on the subject of milling gold ores, including systems of amalgamation, concentration, chlorination, etc. It is this class of information that the miners need. If the method employed at one place is better than that of another, let them all know who is doing the best work, and by what means it is done. The present State Mineralogist is perfectly competent to conduct such an investigation personally. In other departments a few skilled assistants may be employed. It is not likely that any one will grumble if three-quarters, instead of the enforced one-half, of the appropriation goes for investigations of this character. The museum is complete and valuable in its way. It can grow more slowly than it has for awhile, without harm, while the efforts of the trustees and mineralogist are directed toward the field work. In this way the Mining Bureau can be of more practical aid to the mining interests than it has been in the past, and, when the time comes for another appropriation, it will be found there will be no such opposition to the institution as developed itself this session. One can hardly blame the members from the interior, if they can see no use for an institution in San Francisco, which they think only maintains a lot of handsome showcases full of specimens, and a number of officials drawing salaries. They want to see some practical results. It is now probable they will see them.

The Impounding Dams.

No bill has attracted more attention during the present session of the Legislature than the Walrath bill, which permits the hydraulic miner to build dams for restraining the debris. It must be said that although there has been a bitter fight against it, the whole subject has been discussed in a fairer spirit than has been the case for some years. A great many hours have been devoted to discussing the matter. On Saturday last the bill passed to engrossment and a third reading in the Senate. There was a hot debate over the bill just previous to the order to engross, and several times it looked as if there would be a fight, with something besides tongues.

The only amendment made was that all the stockholders in the companies to build the proposed dams shall be residents of the State.

The final vote in the Senate, on Wednesday, resulted in passing the bill. The vote was as follows:

Ayes—Abbott, Bowers, Briceland, Byrnes, Caminetti, Conklin, Goncher, Hall, Haynes, Jones, Lenahan, McCarthy, McDonald, Maney, Moffitt, Murphy, Patterson, Pinder, Spellacy, Sullivan, Vrooman, Walrath, White.
Noes—Boggs, Chandler, Clunie, Crandall, Dixon, Dray, Gesford, Hinshaw, Langford, McCudden, Rose, Roth, Sargent, Steele, Wilson, Yell.

MECHANICAL PROGRESS.

Independent Thought in the Shop.

Earnest, independent thought on this part of any boy or young man who has set out to make a mechanic of himself will certainly bring him both knowledge and skill in his chosen calling.

We hear and see statements every little while that as machine-shops gradually grow into manufacturing concerns, the work is systematized until there is nothing but routines in the different classes of work, and a boy apprenticed to one of these establishments "gets no show" in the shop, and is "no good" when his time is out; that a graduate from, say, a steam-pump shop, going to any other shop doing a different class of work must work for small wages, in order to "hold a job," because he cannot take hold of work as it comes along and do it intelligently. He is pictured as being sent out of the shop to make repairs upon a steam engine, or line up a shaft in a brewery, or to fix a hydraulic elevator that is on a strike.

After wasting an hour or two of time, he admits that he is "stuck," and goes crestfallen back to the shop, taking this message to the foreman: "Send up a machinist next time." And then the parties get their work done at some other shop, and refuse to pay for what our pump-man has done, because he did not know what he was about. He actually caused damage by his ignorance. Why is this? He might have been a good man in a pump-shop, but fails immediately on attempting printing press or sewing machine work. He has learned to turn and bore, to plane and slot, to chip, file and scrape, but fails when asked to perform any of these operations on anything except a steam pump. Is it because he has not learned to do these things well, or because he did not use his brains while learning to use his hands?

Machine-shops are always overrun with applicants for apprenticeship. But nine tenths of the applicants for places never think of anything beyond getting into the shop. Of their own fitness for this machinist's trade, they never inquire into. They expect to work three years for a little less pay than they could get shoveling, and then blossom at once into a first-class, well-paid machinist, with no particular mental effort on their part. This result is easy to see. We see it every day in the army of workmen who can do only the commonest kind of skilled work, and oftentimes in only a single branch of the trade of which they call themselves masters.

This I claim is from want of thought on the part of the boy or man himself. The steam-pump man if he has mastered the trade as far as taught in the steam pump shop, has mastered the principles upon which the steam pump operates, and is a competent man to send out to repair a gas engine or a printing press. But this he cannot do without thought, and thought is but another name for study. The study that it takes to master the principles of the steam pump will incidentally bring knowledge of other machinery that cannot fail to be of use some time.

A boy once taught the habit of individual thinking about his work, a place in the front rank of mechanics is sure to be his. Thought will give him confidence and skill, and with these two elements in his mechanical make-up he will prove a valuable man anywhere he is employed, whether they build sawmill machinery or machine tools to build sawmill machinery with.—*American Machinist.*

Working Tension of a Belt.

A number of experiments have been made in the mechanical laboratory of the Massachusetts Institute of Technology on the transmission of power by belting to determine the ratio of tension when pulleys are slipping under the belts, and when belts are sliding over pulleys by means of the sun, and the difference of the tension of the slack and tight sides of the belting. A constant load is brought on the shafting by means of a nicely-made Prony brake, on which the power used can be weighted, and by means of a counter on the shaft that gives the number of revolutions per minute, by which the difference in the tension of the two sides of driving belt can be computed to a nicety. The next operation is to compute their amount while the shaft is still in motion, which is accomplished by transmitting the power from the driving shaft to another in the same line by an intermediate shaft, which is hung from these by two belts of equal length, the pulley being of equal diameters. Now, the supports which contain this hanging shaft are attached to levers, by means of which the sum of the tension on each of the belts by which it is suspended can be weighted. Speed counters are attached to each shaft, and with the break the sum of the tension on both the returning and the starting side of each belt and their difference is shown, from which one-half the sum added to one-half the difference will be the strain on the driving stretch, and the remaining half, less one-half the difference, will give the tension on the slack side, without the assumption of any friction theory being entertained. With this apparatus the least amount for the combined tension with which a shaft can be driven without the belt slipping off can be determined for transmitting a given power at a given speed of belt, and the speed with which the belt is slipping on the pulleys. If a given power is to be transmitted with a given speed, and the slip-pages of the belt not to exceed a given amount,

the strains from this belt and the tension on each side, and questions of a similar character, can be definitely answered. Then on the question of the width of a belt: If 663 pounds per inch of width through this lace-holes is a safe working strength, all that is required is to divide the tension on this tight side of the belt by this amount to get at the width in inches.

Science in the Workshop.

When mechanics as a general body become more thoroughly impressed with the conviction that the way to advancement, both as to personal position and monetary returns, lies through the mastery of science, in the application of principles to their daily work, we may anticipate some joint movement on their own part to establish means for acquiring technical knowledge. We might multiply examples of the benefit of courses of scientific training. The proper understanding of the laws of expansion and contraction, as applied to many castings, and even to the wrought iron and steel industries, would prevent much waste in the foundry and at the forge, from the effect of unequal expansion and contraction, and also occasion fewer inequalities in the quality of that supposed treacherous material, steel. It would also prevent many mishaps to boilers, engines and their accessories in cold weather. A knowledge among workmen of the principles of inertia as affecting bodies in motion, would frequently prevent a breakdown in starting or stopping machinery suddenly. For all connected with blast furnaces, the value of chemical knowledge is apparent, as enabling them to trace the cause of faulty results. There is scarcely a workshop of any importance in which an acquaintance with geometry will not be of value. In short, the value of science asserts itself every hour in the workshop. The scientific mechanic never falls into ruts, either of thought or habit. Working more intelligently than others, he finds more pleasure in his labor. His suggestive faculties are ever at work, and he is ever alive to the possibility of mechanical improvements, from which he may reap a handsome reward. The manufacturers who have risen from the bench without acquaintance with technical science constantly feel themselves at disadvantage.—*Trade Review.*

CARBON IN STEEL.—A correspondent of the *American Engineer* furnishes some food for thought in regard to the combination of carbon and steel under certain conditions. The correspondent among other things says: "We note quite an inquiry for fresh thought on the subject of bettering the condition of tire metal, physically and chemically. Suppose we start with pouring the metal into the molds, we find that when the 'heat' has been properly cooked the carbon in it is hotter than the iron; it remains hotter, by reason of its refractory nature while cooling, until it combines with a small per cent of the iron. When the initial temperature is allowed to subside before any work for reduction is done on the metal and fresh heat has to be used for annealing the skin, then most likely the iron, by reason of its being a fair conductor, gets hotter than the carbide, which, at best, is a first-class non-conductor. This makes two dissimilar elements to deal with under the hammer or in the rolls—95 to 97 per cent soft ductile iron, the other 3 to 5 per cent mostly hard carbide forming their cell walls, isolating the atoms of metal, so cohesion is out of the question. Under existing systems the work of fining up the metal is not done till after a portion of the carbon has combined chemically and irrevocably until melted again with a small per cent of the iron to form an irregularly cellular structure which will keep the shape of the metallic mass, without its weight or strength, after all that is valuable for actual service is eaten out with salt water or weak acid."

STEAM BOILER INSPECTION.—The benefits to be derived from the Hartford Steam Boiler Inspection and Insurance Company are becoming more and more apparent each year. The amount of business transacted by the company in 1886 was the largest that has been done by it during any one year in its history. The premium receipts exceed those of any other year. The assets of the company are upward of \$679,000 as against \$554,000 one year ago. The prospects for future business are very flattering. The company is called on for advice in the construction of boilers and laying out boiler plants, and is constantly doing a large business in that direction. It has laid out more than 50 plants during the past year, all of which are giving complete satisfaction. In laying out and arranging these steam boiler plants the company studies the economy of fuel, which is a matter of great importance to manufacturers in these days of close margins.

DEMAND FOR MACHINERY.—The demand for heavy machinery for every conceivable manufacturing purpose was never greater than at this time. Engines with horse-power ranging from 100 to 500 are now in common use, and manufacturers of machinery of huge proportions for textile work for general manufacturing purposes are overrun with orders.

COLLAPSE IN LOCOMOTIVE BUILDING IN EUROPE.—Reports are to the effect that there is a great falling off in the demand for locomotives at European shops, notwithstanding the fact that prices have fallen to nearly one-half what they were 10 years ago.

SCIENTIFIC PROGRESS.

The Magnetic Pole and the Aurora Borealis.

For the same latitude, the United States is better situated than other lands to view the aurora borealis when it breaks forth. At Pekin, in China, a display of the northern lights has never been seen, and the Chinese are very careful with their records of this character, and run much farther back into ancient time than our own. Still, Pekin is about the same distance from the North pole, or on about the same parallel of latitude as Philadelphia, Indianapolis or Denver, at which places the auroral displays are very frequent and oftentimes quite vivid. In the latitude of New York City, they are as frequent and brilliant as along the northern shores of Siberia, although the latter is nearly 2000 miles nearer the pole. In fact, the aurora borealis has a sort of pole of its own, or what we call the magnetic pole.

Now this magnetic pole is just north of the United States, and some 1400 miles nearer to us than the geographical pole or earth's axis; so this readily explains why we see more frequent displays of the northern lights than our opposite neighbors, who must be some 1400 to 1500 miles nearer the polar regions to see them as well as we do. But this magnetic pole is traveling slowly westward around the other pole, going around the earth in its parallel of latitude every 1000 or 2000 years; and the time will come in the far future that the Chinese at Pekin will have as frequent displays of the aurora borealis as we do now, and we will then have none.

Nearly all our readers have probably seen the beautiful bows of brilliant flame the auroras form in the north. Well, the center or highest point of this bow or arc is always directly over or on a line drawn from the spectator to the magnetic pole. Its highest point appears almost directly north to us, because the magnetic pole is almost due north; but in Great Britain or Norway the highest point of the beautiful chromatic curves would be to the northwest, while in Siberia or the upper part of the Japanese islands the top of the arc would be to the northeast. In fact, many explorers have been north of the magnetic pole, and from there they see the highest point of this brilliant bow in the south, and if they passed northward on the east side of this peculiar pole, the auroral arc was in the west at the time. The magnetic pole is laid down on the map on the west side of the Baffin peninsula. It was here that it was discovered and located by Sir James Clarke Ross in 1831, but since that time it has traveled westward. The rate at which it so travels is given various values by different scientists. There seems to be a general movement westward around the world of all magnetic forces, which the pole is only accompanying with all the rest.

When the mariner's compass was first discovered, or brought from China, many hundreds of years ago, the needles pointed nearly north in England and the magnetic pole was probably about Spitzbergen, or between that country and Greenland. Now the place where the needle points true north is in the United States, having crossed the Atlantic; and in Great Britain the magnetic needle points nearly north-west. And so the auroral displays, which are celestial manifestations of magnetic force, are also slowly traveling around the world every 1000 to 2000 years, giving each northern country a series of most beautiful effects.

But if the aurora borealis is so dependent upon the north magnetic pole, and increases in frequency and brilliancy of display as it is approached, what must they be, one would naturally think, at the magnetic pole itself? The first inference is that we would expect to see a perfect dome of playing prismatic colors in the heavens all the time, or at least in the winter, when the long arctic nights would be favorable toward such brilliant effects. On the contrary, the north magnetic pole is one of the poorest places possible to see the maximum displays of these fireworks of the frigid zones. The author of this article spent a small part of a winter very near this spot—near enough to have witnessed any aurora, and the few displays witnessed were so many were expected were quite noticeable for their paucity, after diligently watching for them for a long time. In fact, an observer must get a few hundred miles away from the magnetic pole to see the greatest number of aurora borealis and the finest displays of them.

LIGHTNING HOLES.—Prof. Brun has published in the *Archives de Geneve* an interesting study on the so-called lightning holes to be found in the High Alps. He and other investigators have found them at heights at between 11,000 and 13,000 feet above the sea level. Usually they are found on summits. Sometimes the rocky mass, which has been vitrified in the passage of the electric fluid, presents the appearance of small scattered pearls, sometimes of a series of semi-spherical cavities only a few millimeters in diameter. Sometimes there are vitrified rays going out from a central point to a distance of four inches or five inches. Sometimes a block detached from the mass appears as if bored through by a cannon ball, the hollow passage being quite vitrified. The thickness of this vitrified coating or stratum never exceeds 1 millimeter, and is sometimes not more than the quarter that depth. The

varying colors which it presents depend on the qualities and composition of the rock. The same may be said as to its transparency. On the Rungfischhorn this glass thus formed by the lightning is black, owing to the quantity of actinolite which this rock contains. It is brown on La Rivolette, the rock consisting of feldspar mixed with gneiss containing chloride of iron. Under the microscope these lightning holes display many interior cavities, which must be attributed to the presence of water in the rock at the moment of melting by the electric discharges. This vitrified material has no influence on polarized light.

EFFECT OF IMPURITIES IN GOLD ALLOYS.—The way in which an alloy of gold and copper is effected by a small quantity of impurity presents one of the most serious difficulties in working gold. It has been known since the seventh century that minute quantities of certain metals render gold brittle, and in a recent lecture at Birmingham, England, Prof. Austin Roberts said: "It may be well to demonstrate the fact. Here are 200 sovereigns. I will melt them and will add in the form of a tiny shot a minute portion of lead amounting to only the 2000th part of the mass, first, however, pouring a little of the gold into a small ingot, which we can bend and flatten, thus proving to you that it is perfectly soft, ductile and workable. The rest of the mass we will pour into a bar, and now that it is sufficiently cold to handle, you see that I am able to break it with my fingers, or at least with a light tap of a hammer. The color of the gold is quite altered, and has become orange-brown, and experiments have shown that the tenacity of the metal—that is, the resistance of this gold to being pulled asunder, has been reduced from 18 tons per square inch to only five tons. These essential changes in the property of the metal have been produced by the addition of a minute quantity of lead."

THE PITA PLANT—A VALUABLE FIBER.—The pita plant, a native of Honduras, invites the enterprises of American capital and inventive genius. Our consul there, Mr. Burchard, reports that the plant has never been cultivated or utilized to any considerable extent by any outside people; but it grows spontaneously and in apparently inexhaustible quantities by the margin of every river and lagoon, and indeed anywhere below the altitude of 2000 feet, and can be had for the cost of cutting. The fiber is susceptible of many important uses. The natives convert it into thread for sewing boots and shoes, and into nets, fish-lines and cordage. The finest and most costly hammocks are also made of it. The small quantities which have been exported into manufacturing communities have been worked up into handkerchiefs, laces, ribbons, false hair and wigs. The difficulty is to decorticate the plant without rotting or otherwise injuring the fiber. The man who can do that will be able to take fortune at the flood.

MORBIN IMPULSES.—Question: What is the cause of a person having a feeling as though he had to jump or throw himself down, while standing near the edge of the wall of a high building, or place 40 or 50 feet above the ground? Answer: This feeling is due, we think, to a sudden confusion of mind produced by the new situation in which one finds himself when brought to survey the prospect from a lofty elevation. It is a change in relation to one's surroundings that seems at first to set experience at fault, and the faculties of perception, therefore, are at first disturbed and out of coordination. Size, weight, locality, etc., in many persons may require time to adjust themselves to the new conditions. Men who are accustomed to work at great elevations—roofers, painters, etc.—do not as a rule suffer from such morbid sensations, because their faculties have become educated to the relations of altitude.—*Herald of Health.*

PRODUCTION OF SOUND.—Sound is produced by the vibrating body creating a movement in the surrounding atmosphere, just as a stone thrown into water makes ripples on its surface. The particles of the air propagate this impulse one to another, and the waves thus formed finally strike on the ear, making the impression on the auditory nerve which is flashed inward to the brain, where it is perceived as sound. It follows that there is no sound, although there are vibrations, unless there be a hearer. The thunder rolls in silence, the avalanche falls noiselessly, unless reverberated in the living ear, which can translate the rushing of the disturbed atmospheric atoms into sound.

ANTIQUITY OF THE HOT-AIR FURNACE.—The younger Pliny, writing to one of his friends about one of his country seats, mentions, among other things, that next to the smaller drawing-room there is a semi-circular room with windows arranged so as to get the light of the sun all day. He says: "Out of this is a bedroom which can be warmed with hot air." He also refers to the "bath with its cooling-room and its hot-room." As Pliny, Jr., lived A. D. 62-116, we may assume that hot-air furnaces are no new thing.

QUICK MECHANICAL WORK.—By the addition of automatic attachments to a press and pair of gang dies, the Ferracute Machine Company, of Bridgeton, N. J., has succeeded in procuring 288,000 lamp collars per day in a single press. This is at the rate of 480 per minute, and affords an explanation of the low prices of some sheet-metal manufactures.

Placer Mining on the Salmon.

The Salmon river, like many other mountain streams of Northern California, is mined continuously from its narrow, precipitous beginning to its mouth. The rapid fall of its waters afford unusual advantages for working the extensive gravel deposits which are found on its many bars and points running down to the river channel. Large ditches taken out a few hundred yards above and graded along the canyon give sufficient pressure for a "pipe-head," by which numerous of these bars and points are being worked day in and day out for the shining particles of wealth which they so abundantly contain.

Before the day of "giants" and "hydraulics" the hardy pioneer miner toiled laboriously with pick and shovel in what was termed ground sluicing. Those days and men are gone, but their old work—the solemn indications of other times—remain, and where even these are supposed to be exhausted the almond-eyed Mongolian now reveals in all his glory, diligently and indefatigably searching for what was in those days passed by as of little consequence.

Among the principal placer claims the Summerville hydraulic mine is deserving of special mention. The mine is under the direct supervision of Geo. C. Spooner, who is a very able and experienced miner, having been engaged in the business for years in various mining districts of this State. The water utilized at this mine is principally obtained from the headwaters of the Salmon river, which has its elevated source in the lofty Salmon mountains. In order to convey to the mine the vast quantity of water used, the company has a ditch six miles in length and two others much shorter. The first section of the long ditch descends Right-hand gulch, a distance of two miles. Here, by means of a conduit of sufficient size, the entire ditch head is carried down within 90 feet of the river, a distance of 150 feet, and up on the opposite side to a corresponding level, where it forms a junction with the ditch from Left-hand gulch, and continues down the canyon till reaching Summerville. The company has three large giants, which, with the terrific pressure of 300 feet, sweep the boulders and gravel with frightful force precipitately before them into the flumes. These flumes, exacting their precious toll, deposit the heterogeneous mass of debris into the swift flowing river to be swept away by its foaming torrent. The abundant water, high pressure and good dump enable the company to work off a vast area of their limitless supply of mining ground annually. And it is not to be doubted that, for its advantageous situation and natural facilities, the Summerville mine is the best placer claim in Siskiyou county.—*Cor. Yreka Union.*

Academy of Sciences.

At the regular meeting of the Academy of Sciences, on Monday evening last, President Harkness was in the chair. Walter E. Bryant was elected a resident member.

Dr. H. H. Behr read a paper on "The Power of Adaptation in Insects."

The president spoke of the fungoid growth affecting the eucamores, which he had been observing for many years. Every season when the eucamore leaves attain the size of a quarter of a dollar, they become blighted, sometimes being fresh and green in the evening, and the next morning being blighted. He observed the same thing in the East, and had been told by Prof. Gray that the eucamores of Massachusetts had been affected in this manner for 50 years. Dr. Harkness had made careful observations, and determined the cause to be a minute fungus, which he had named *Glaesporium Platoni*. In former years the eucamores had been well-shaped, but now they are generally scrawny and unsightly, with few straight limbs. This he attributed to the ravages of the fungus.

Dr. C. M. Richter read a supplemental paper to that read by him at the previous meeting, refuting certain criticisms made by Professor Geo. Davidson upon the statements in that paper, as published in the newspaper reports of the Geographical Society meetings.

One of the audience, a non-member, asked the president permission to speak, and stated that he had resided for some six years in the vicinity of Bahrings' straits, engaged in observation for the Smithsonian Institution, and that he would corroborate Prof. Davidson's views on the subject of the currents. A discussion ensued in which this gentleman, Dr. Richter and Dr. Behr took part.

Dr. W. P. Gibbons interrogated the secretary at some length concerning the publications of the Academy, more particularly as to the publication of the president's inaugural address, read January 17th, and the changes made in the cover of Bulletin No. 6. He afterward addressed the Academy on the subject.

The new hoisting works of the Wildman, at Sutter Creek, are getting along first rate, and the people there are rejoiced at the prospect of soon seeing a big mine in running order, hoping that it will be but the forerunner of the opening of other mines in the immediate vicinity.

The southern portion of Esmeralda county, Nevada, which contains several mining camps and many valuable mining properties, is presenting a prosperous outlook.

GOOD HEALTH.

Can Cancer be Cured?

"Is there a positive and reliable treatment for cancer? Is there a reliable remedy that will effectually cleanse the blood of a cancer humor?"

EDITORS PRESS:—The above queries appear in the columns of *The Brief*, a well-known medical journal of New York. They are put forth in a communication to that journal by P. C. Smith, M. D., of Orrington, Maine. No attempt is made to answer the queries.

Medical books contain no reliable remedy, nor do they prescribe any uniform mode of treatment for cancer, in any of its various forms. Yet we sometimes meet with reports of supposed cures in medical journals. The last number of *Braithwaite's Retrospect of Practical Medicine* contains an article from a London physician, in which the editor is asked, "Shall we ever be able to cure or arrest this disease [cancer]? I am afraid not; but in some cases we may." Quits a number of cases are cited in which the progress of the disease has been materially checked, and one instance is referred to where the cancer quite disappeared of itself, without any application, internal or otherwise. Another disappeared from treatment other than by the knife. But in no case is it claimed that a direct cure had been effected under any treatment designed to "cleanse the blood of a cancer tumor." The writer in *Braithwaite* disapproves of the use of the knife in all cases of cancer in the breast. Plasters to "cut out the cancerous tumors" are suggested as preferable. Another article in the same number makes quite a lengthy reference to

The Use of Olan Turpentine

In cancer on the tongue, lip and uterus. This article is written by John Clay, M. D., the man who first suggested to the medical world, some six years ago, the use of that remedy. As an evidence of the unwillingness of a great majority of the medical fraternity to admit of the possibility of anything like a "cure" for cancer, Dr. Clay asserts that this remedy has never been received by the medical profession with very considerable favor, and adds: "Much outspoken, not to say hostile, criticism of the remedy has characterized the discussion which resulted from that communication." And yet there are numerous isolated cases of at least apparent cures which have resulted from the use of the remedy with no detriment to patients under any circumstance. Four apparent cures are reported in the article before us which have recently been noted. It is to be regretted that so much prejudice should be found among medical men in regard to any treatment other than the knife for this malady.

The Writer of This Article

Having twice been called to lay away a life companion—in both cases victims to the dreadful malady which forms the subject of this present writing—has very naturally been induced to inquire somewhat carefully into the whole matter of the causes and treatment of cancers. His unfortunate experience (probably without a parallel in medical history) may be accepted as some excuse for the unusual interest he is taking in the subject, and his lack of medical knowledge will account for the difficulties encountered in the study thereof. Medical books, medical serials and extended conversations with prominent medical practitioners have been the media through which information has been sought. In this search he has learned that there is a great diversity of opinion among medical men as to the origin, spread in the system and treatment of cancers and cancerous tumors. In the course of his investigation, and in an honest search for truth, he has been guilty of the unpardonable act (in medical minds) of sometimes going quite out of the beaten path laid down and fenced in by medical schools for such research. He has gathered up and carefully studied many publications of non-professional men, who have assumed to "cure cancers" by secret methods of their own. He has visited patients who have come from all parts of the continent, and learned of not a few sad victims of their practice. But, quite remarkable as it may seem, it has been exactly in this direction that the greatest light has been found—the most promising ray of real hope for an effective remedy for this terrible scourge of humanity.

Personal Investigation.

Having discovered some small evidence of the truth for which we were seeking, we carefully avoided all contact or intercourse with the practitioner, but sought out and interviewed a large number who had received benefits. We readily found a full half-score of persons who had been under treatment or examination of the best physicians and surgeons of this city—most of whom had been operated upon once or twice, but in whose cases the malady as usual had returned, and the patients were told that they must submit to the second and third operation. In all the cases that were interviewed, chance or personal friends had taken them to the practitioner in question, whose identity, at least for the present, shall be nameless, as this is no advertisement. The result in every case examined has been favorable. Positive cures appear to have been effected, as in some cases six and eight years had elapsed without any return of the malady. We do not wish to be understood that no failures were encountered. This specialist, like all

others engaged in the healing art—as we subsequently learned—lost patients, but only in cases where the knife had been used or the disease had advanced to a very critical period. After months of the most diligent inquiry, we have been unable to hear of a single failure where a patient has been presented at an early stage of the disease, or up to the time when in ordinary practice the knife would be applied. These observations and the testimony of so many living witnesses, and a reference to a great number of others, whose examination would have been simply cumulative and involved only a useless loss of time, so impressed us that we resolved to interest, if possible, some of our regular practitioners in the matter, and secure a class of observations from an admitted medical standpoint.

Seeking for Medical Investigation.

Seeking for aid in this direction we soon found was uphill work. The fact that the practitioner kept the remedy a secret was at first a bar to any progress, although the party is a licensed practitioner under the eclectic school of medicine. But having become convinced in our own mind that the matter was well worthy of a thorough medical investigation, the writer continued his interviews with different physicians, begging of them in the name of humanity and for the real furtherance of medical science to lay aside all prejudice, and for this once stop over the iron bound rules of medical ethics to look into the matter sufficiently either to remove our own, perchance erroneous impressions, or possibly, if it might be, substantiate them as correct. Should the latter be the case, we hoped that a sufficient influence might be brought to bear to procure an official investigation by the faculty, on the successful result of which a sum might be raised to purchase the secret for the benefit of the world.

An Intelligent Medical Inquiry.

After many failures the writer finally succeeded in interesting several intelligent physicians in the inquiry—every one of whom, after a full and free investigation, meeting with large numbers of patients who have submitted themselves to treatment, and visiting patients under treatment from time to time, and noticing decided and most remarkable improvement, has expressed the opinion that the matter is well worthy of a more thorough and official investigation by some properly organized and fully acknowledged medical body. We understand that the matter has been laid before the City and County Medical Association of San Francisco, which body decided that, under their rules and regulations, they could not consider it.

We regret that the investigation could not have been made without any outside or newspaper talk, and kept quietly within the body of the fraternity itself until some result was reached, either for or against. The fact that eight different physicians have taken it upon themselves to make personal investigations and have all come to the same conclusion, that the matter is worthy of a still more extended and careful inquiry, shows that it has merit. And we now and here express the opinion that there is not a physician in San Francisco who will take the trouble to spend half the little time that those to whom allusion is made have done, who will not come to the same conclusion, if he allows his reason to act, free of prejudice.

As there are several parties who have taken notes of their observations upon cases under treatment, we have made application to one who is perfectly willing to place his notes in our hands for publication. The whole matter will now be brought directly to the ear of the public, so that they can judge for themselves of the value of the evidence which the medical profession, as a body, has ignored.

W. B. E.

USEFUL INFORMATION.

Plumbers' Recipes.

The *Sanitary Plumber*, which should be good authority in such matters, gives the following recipes for plumbers and others:

Chloride of zinc, so much used in soldering iron, has, beside its corrosive qualities, the drawback of being unwholesome when used for soldering the iron tins employed to can fruit, vegetables and other foods. A soldering mixture has been found which is free from these defects. It is made by mixing 1 pound of lactic acid with 1 pound of glycerine and 8 pounds of water.

A wooden tank may be rendered capable of withstanding the effects of nitric or sulphuric acids by the following method: Cover the inside with paraffine; go over the inside with a sadiron heated to the temperature used in ironing clothes. Melt the paraffine under the iron so as to drive it into the wood as much as possible, then, with a cooler iron, melt on a coat thick enough to completely cover the wood.

For brassing small articles: To one quart water add half an ounce each of sulphate of copper and protochloride of tin. Stir the articles in the solution until the desired color is obtained. Use the sulphate of copper alone for a copper color.

To clean rust from polished steel, mix 10 parts of tin putty, 8 of prepared buck's horn, and 25 of spirits of wine to a paste. Cleanse

the article by rubbing with this, and finally rub off with blotting paper.

A good cement for celluloid is made from 1 part shellac dissolved in 1 part of spirit of camphor and 3 to 4 parts of 90 per cent alcohol. The cement should be applied warm, and the broken parts securely held together until the solvent has entirely evaporated.

Tin and tin alloys, after careful cleansing from oxide and grease, are handsomely and permanently bronzed if brushed over with a solution of 1 part of sulphate of copper (blue-stone) and 1 part of sulphate of iron (copperas) in 20 parts of water. When this has dried, the surface should be brushed with a solution of 1 part of acetate of copper (verdigris) in acetic acid. After several applications and dryings of the last named, the surface is polished with a soft brush and bloodstone powder. The raised portions are then rubbed off with soft lather moistened with wax in turpentine, followed by a rubbing with dry leather.

IMPROVED TELEPHONE WIRES.—The German post-office is now using, to a considerable extent, the new anti-induction telephone cables made by Messrs. Felten & Guilleaume and others. The usual cable for overhead circuits contains wires of 27 to 30 mm. diameter, each separately insulated, and wrapped on the outside with tin foil. The cable thus formed is surrounded with three naked copper wires, and sheathed with a lead covering. The whole is protected by a hemp taping and bitumen. These cables, when used for overhead circuits, are not strong enough to support themselves, and must be suspended from cast steel wires. The three naked copper wires, as well as the wrappings of tin foil, are all connected to earth. A smaller cable, containing only 14 wires, is also manufactured. A large number of these cables are now erected throughout Berlin, and are used with satisfactory results.

HOW TO DO LUSTER PAINTING.—This is simply painting with bronze powders, metallic flitters, etc., instead of paints. The pattern must be first stamped as for embroidery. The outlines may then be heavily outlined with a fine brush. The paints are laid on with flat bristles brooches, Nos. 5 and 11 are the sizes most used. Arrange the powders and bronzes in the hollows of the palette, and mix by adding a little of the medium. As the medium dries rapidly, only a few colors should be mixed at a time. In working the most delicate parts, take only a little paint at a time on the brush. In painting velvet or plush, always paint with the nap; that is, draw the brush down in the same direction the nap runs. Do not be afraid of using too much paint. Apply it thickly but lightly to the surface. If flitters are used, they should be sprinkled on the fresh paint before it dries.

SOLDERING COPPER.—When copper is soldered and the solder is to be colored like the surrounding copper, this can be done by moistening the solder with a saturated solution of vitriol of copper, and then touching the solder with an iron or steel wire. A thin skin of copper is precipitated, which can be thickened by repeating the process several times. If a brass color is desired, a saturated solution of one part of vitriol of zinc and two parts of vitriol of copper is used on the previously coppered solder, and the latter rubbed with a zinc wire. To gild the soldered spot, it is first coated with copper in the manner indicated above, then with gum and isinglass and powdered with bronze powder. A surface is obtained, which after drying can be very brightly polished.

BRICKWORK may be rendered waterproof by the application of the following wash: Soft paraffine wax, two pounds; shellac varnish, one-half pound; powdered rosin, one-half pound; benzoline spirit, two quarts, all dissolved by gentle heat in a water bath, to which is to be added one gallon of benzoline spirit. The wash is to be applied to the brick wall warm, care being taken to keep it away from the fire, as the mixture is very inflammable.

TO DETECT SEWER GAS.—A very simple test to ascertain whether the air of any apartment contains sewer gas is made by saturating unglazed paper with a solution of one ounce of pure lead acetate in half a pint of rain-water; let it partially dry, then expose in the suspected air. The presence of sewer gas in any considerable quantity soon darkens or blackens the test paper.

THE LONGEST TUNNELS IN THE WORLD.—The Mount St. Gothard tunnel is 48,840 feet long, or nearly 10 miles long, the longest in the world. Mont Cenis tunnel, Italy, is 36,840 feet long, or about seven miles long. Hoosac tunnel, Massachusetts, is 25,080 feet long, or about 4½ miles. The Nochtongong tunnel, 21,650 feet long, or about four miles. Thames and Medway, England, is 11,880 feet long.

TO CLEAN FEATHERS.—Make a lather of curd soap, boiling water and pearlash; when it is a little cool, wash the feather in it, gently squeezing it; wash it again with less lather, and then rinse it in cold water, shaking it well before the fire, but not too near. Curl it by drawing each fiber over the blunt edge of a fruit knife. If the color is not good, use a little blue in the rinsing water.

ADULTERATED FLOUR, ETC.—Flour and other farinaceous substances are spiced with plaster, potato starch and other similar cheap ingredients.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Dispatch, Feb. 26: Work on the Wildman mine is progressing as rapidly as possible. Frank Mails has the contract for laying the pipe some 2000 feet, which he will complete in a short time, weather permitting.

WORK RESUMED.—Amador Ledger, Feb. 26: Work has been resumed on the Sargent mine at Middle Bar, under directions, we are informed, of W. Petre, one of the bondholders. The Amador or McKay mine is moving along very slowly. The shaft is down 130 feet. Rumor has it that the Maboney mine has been sold, and that the parties interested have gone home to make out the papers. It is the universal hope that this report may prove true, as it will give some foundation for hope that the mine will ever long be started in a business-like way. The Zeile mill had to take to steam for 48 hours last week, owing to a break in the canal near Bald Rock flume. The Cupps or Chicago mine, just east of the New London, is being energetically worked. The shaft has reached a depth of 60 feet. The work is under the supervision of Mr. Cupps, who has agreed to give nearly one-half interest in the property to the capitalists of San Francisco who are furnishing the necessary money for its development. The Amador gold mine is in Hunt's gulch, John I. Minear, superintendent. It was formerly the McKay mine. It is being worked on a small scale, with encouraging prospects. The Middle Bar gold mine is located at Middle Bar, near the old Hardenberg mine. Little has been done in the way of its development, but it is considered a likely spot to develop into solid property.

Calaveras.

BULLION.—Cor. County Record, Feb. 26: The Esmeralda mine on Indian creek is doing finely; the shipment of bullion is regular and generous. I was told upon good authority that the owners have refused an offer of \$50,000 for the mine from Haggins. R. H. McDonald, president of the Pacific Bank, is one of the owners. Work on the Oro Plata mine has been much retarded the past few weeks on account of the inclemency of the weather, and it will be some weeks ere the full complement of men are at work again. The burlighs and pulverizers are in full blast, however. The company paid off on the 23d.

WEST POINT.—Calaveras Prospect, Feb. 26: A gentleman who recently visited the Lookwood mine, at West Point, gives a very flattering report of that property. Shaft, 200 feet deep; vein, five feet and widening; ore pays \$130 per ton on an average. Rock has to be carried three-quarters of a mile in wagons to an eight-stamp mill. This is a young enterprise with very bright prospects.

UNION MINE.—Cor. Calaveras Prospect, Feb. 26: A flying trip to Union mine discloses the fact that we have here a second Sheep Ranch mine. One not conversant with this big enterprise that has been inaugurated in the vicinity of San Andreas, and the demand it creates for material to carry on its extensive operations, would, at the sight of so much fuel piled up around the engine-house, wonder if the company had designs upon the surrounding timber land; also, judging by the thousands of feet of large timbers piled up here and there (used in the mine), that they owned a sawmill or two. All this is a big demand for the county's resources. This mining enterprise has created an extensive field for the wage-worker.

El Dorado.

HENRYS DIGGINGS.—Mountain Democrat, Feb. 26: All the mines closed or stopped work on account of the heavy fall of snow, this snowstorm being by far the largest in five years, four and a half feet at this place. The men at the Crystal mine have been compelled to stop work, the flume having been broken by a number of trees falling across it; consequently they cannot run the blower, and will be obliged to wait for the snow to melt off before repairing damages.

Fresno.

HILDRETH NEWS.—Fine Gold Miner, Feb. 25: In the James & Francis mine, the ledge of 16 inches of sulphurets, opened up last week, has increased to two feet in size upon this week's development in the working shaft. The sulphurets ore will assay \$700 per ton. The ledge-matter of three feet averages \$85, in coarse gold, by arastra. Superintendent Wahls, of the Hildreth mine, is sinking on the working shaft, and has been boistering some very fine ore—too rich to lay on the dump. The ore is sacked for storage. At present the shaft is 330 feet deep. The rich body of ore in the White Rock ledge holds its own in the south drift. The ore contains one-half galena sulphurets, and will mill \$65 per ton in coarse gold. The late discovery of the Big Bonanza mine, by J. H. Clark and T. W. Robinson, at the face of the tunnel, which is in 70 feet on the ledge, is two feet between walls that prospect \$50 per ton in coarse and fine gold. The owners have started a winze in the tunnel. The McNally mine is hoisting from 55 to 60 cars of ore daily, which is consumed by their mill, including sulphurets. The ore averages, milling value, \$75 per ton. The Morrow mine, at present, is being opened up by tunnel and drifts upon a good body of quartz that averages in size from one to two feet, which is accompanied with a clay, talc, and porphyry gouge that prospects well. The quartz vein will mill \$35 per ton. The Pelan ledge is being sunk upon with an incline on an 18-inch ledge. The owners are taking out ore which will be run through the Hanover mill. Since the heavy rains last week, Mr. Williams has been sluicing the surface upon his placer location. Pete Donahoe has bonded the Morning Star mine. Superintendent John McNally arrived upon Wednesday's stage, after a four-weeks' visit to San Francisco, looking as hearty as ever. The Hildreth mine commenced hoisting rock from the bottom, Monday. The ledge looks a good deal better than many thought it would. The James & Francis mine surprised its owners Wednesday morning, when 18 inches of sulphurets, of a high grade, were developed. Wonders have ceased in this mining district. This mine is to-day the richest mine in the district. From the breaking of the surface ground for the working shaft down to its present depth of 135 feet, the top, bottom, and

sides will prospect surprisingly. The owners asked \$50,000 for the property, and, from San Francisco authority, could have got, not long since, \$100,000 by holding out.

Inyo.

GOLDEN STAR MINE.—Independent, Feb. 26: Further sinking in the shaft of the Golden Star mine has been postponed for the present. At a depth of about 230 feet quite a strong flow of water was encountered, and Mr. Paterson then stopped sinking and is now drifting in ledge matter. No regret is caused by finding the water; on the contrary, it is quite welcome, and is regarded as a very favorable indication of a good ore body.

Nevada.

GOOD ROCK.—Foothill Tidings, Feb. 25: Glasgow, Richards & Co. are the lessees of the Florida mine, just back of Iord's ranch, Rough and Ready township. A tunnel is in 130 feet on the main ledge, which is one foot thick. There is another ledge two and a half feet in thickness running parallel to the ledge first mentioned, with a gouge of three inches intervening. On Wednesday, from this ledge, several pieces of rock showing well in gold and base metals were taken, and can be seen at Coleman & Glasston's store. The two ledges are of widely different characteristics, the smaller one being free-milling ore, while rock from the larger ledge will have to be worked by the chlorination process to give full returns. The two will probably unite further on in the tunnel.

ANOTHER BREAK IN THE DITCH.—Grass Valley Union, March 2: Supt. Coleman, of the Idaho mine, yesterday received a dispatch from J. E. Brown, Supt. of the South Yuba Canal, that another break had occurred in the Cascade ditch, and that the water was one day behind. The water may come through today, but of that there is no certainty. The force of men from the Idaho mine did two days' work on the line of the ditch, clearing out the snow from the Idaho reservoir to a point some distance beyond the main South Yuba reservoir at Banner mountain. The Canal Company's force is working above that point, and were reported as making excellent progress in clearing the snow out of the ditch until the dispatch above referred to was received announcing another break. There cannot be much longer delay in getting the water through, as the weather is favorable, and no signs of the coming of another snowstorm.

San Diego.

ELSINORE COAL.—Los Angeles Times, Feb. 23: John D. Hoff, the fortunate discoverer of the extensive coal deposits at Elsinore, San Diego county, was in the city recently on his way home from San Francisco, where he has been to buy a plant for mining. While north he had his coal thoroughly tested by experts. It showed up better on analysis than the Seattle coal, which is being shipped to San Francisco by the cargo. The Elsinore coal gives 10 per cent of ash and the Seattle coal 18 per cent. The Elsinore article contains 41 per cent of inflammable gases, as against 33 per cent for the Seattle. The Elsinore coal is a true lignite of the same formation as the favorite Gallup coal, and Mr. Hoff, who has investigated the Gallup mines carefully, is satisfied that he has a better article. He is in partnership with John Dolbeer, a well-known San Francisco capitalist, and they control 400 acres of coal land, the present vein being four feet thick. The plant, which Mr. Hoff has just purchased, will enable them to mine 200 tons daily, and they promise to have their coal on the market within 60 days. The mine is four miles from the California Southern Railroad, and three miles from the lovely and growing town of Elsinore. H. B. Wilkins, General Freight and Passenger Agent of the California Southern Railroad, will visit the mine in a few days, to see about the practicability of running a spur to it.

Sierra.

PHOENIX MINE.—Tribune, Feb. 11: The Phoenix mine has shut down. From present accounts the company has concluded to wholly abandon the property. However, there may be a change in their intentions ere long. As the stockholders of the company are all wealthy, creditors of the mine need have no fear but that moneys due them will be promptly forthcoming. Supt. Schusler left for San Francisco Monday in obedience to a telegram from the company. It is said that the abandonment of the mine is due to the ore tests being unsatisfactory, netting only \$3.75 a ton.

Siakiyou.

THE BLACK BEAR MINE.—Yreka Union, Feb. 24: "The Black Bear mine is fast coming to the front," writes a gentleman well versed in mining affairs to the Union. "At present Lieutenant-Gov. Daggett has about 500 tons of ore at the mill, awaiting warmer weather, when the mill will be started. There is something like 200 tons broke at the mine ready to move. The ledge has been carried down perpendicular 92 feet, and in thickness varies from 2 to 8 feet. The ore is all good and the ledge is holding out good."

Shasta.

COUNTY NOTES.—Shasta Democrat, Feb. 19: The heavy fall of snow has driven many prospectors from the mountains. De Forrest is building several of his patented arastras, for which he has orders. The end of the lower tunnel in the Ballakalla mine is in a large body of rich ore. Tom Greene came down from the Gulch Mountain, and shipped another \$2500 gold brick. The Buckeye placer miners had a poor run so far this season. Weather too cold and water scarce. Next Monday the company having bonded the Scheerer mine, on Salt creek, will commence work on that mine. The Black Bear Mining Company is preparing to have its valuable group of mines on Squaw creek patented. Harry Berg and his partner Hall are running their arastra on Oregon gulch on ore that is paying between \$50 and \$60 a ton. The last of the machinery for the ro-stamp mill at the Muchmore mine at Lower Springs arrived last week and was shipped to the mine. The mill will start up immediately. Development work will commence on the Locofoco and Central mines, in the Squaw creek district, in a few days. The first opening will be a tunnel of 100 feet in length run in the vein, which is expected to expose a large body of ore. Last week Edward Riley & Co. took possession of the Central mine in Old Diggings district, having purchased the property. The former owners reserved about 150 tons of rich ore on the dumps, which they are now crushing. We understand that it is the intention of the new proprietors to erect a large stamp mill on the mine

in the near future. The Lower Springs Mining and Milling Company feel jubilant over their prospects. They claim to have several good mines in a group, which prospect well. Their furnace is completed and a trial has satisfied them that it will work like a charm. They are now preparing to put up crushing machinery. As soon as this is done, and there is a good supply of wood on hand, the works will be started up. We are informed that it is not the intention of the company to do custom work, for they will have all the ore of their own they will be able to handle with their plant.

Tuolumne.

SOULSBYVILLE.—Cor. Union Democrat, Feb. 26: Work has been commenced on the Basin mine, and it is not likely that it will be resumed until the storms are over; there was about 5 feet of snow at the mine Monday. The Trout mine, on the Tuolumne river and near the Basin, has also been closed down, and nothing more will be done till the weather is settled. It is a considerable drawback to the Basin and other mines, but will make an abundance of water next summer. It is reported that they have struck it rich in the bottom level of the Buchanan mine. Men were put to work cleaning snow out of the Rising Sun mine ditch, for the purpose of getting water to start the pumps, but the snow that fell on Monday is a setback to them again. The water in the Soulsby branch ditch has been off for several days, owing to there being so much snow in the hills. The Black Oak mine is running in full blast, there being about 14 men employed. The new booming works are completed. It is expected that this will be among the best mines in a short time. The indications now are very much in favor of the company.

NEVADA.

Washoe District.

IOWA.—Virginia Enterprise, Feb. 26: The storms during the week interfered somewhat with work. Tunnel A has cut east clay of lode, and passed over nine feet of very fine quartz, giving low assays. This body of quartz raised only about one foot above the floor of the tunnel, and is evidently the top of a chimney, which tunnel B will soon cut at a much greater depth. The face of tunnel A is now in vein material carrying considerable quartz. As the croppings show the ledge to be over 50 feet wide, something profitable may be expected before reaching west wall.

POTOSI.—Mining operations have been suspended on the 250 level on account of the snow drifting into the track leading from the tunnel to the dumps. Most of the miners were consequently laid off. Those at present employed in the mine are engaged in making necessary repairs.

ALPHA AND EXCHEQUER.—Good progress has been made the past week driving the north drift on the 122 level. Some of the quartz encountered carries metal that gives good assays. Fair progress has been made in extending the south and west drifts.

ALTA.—Work is going on as usual on 723 and 823 levels. The usual progress is being made in the north lateral drift into the Benton and Keystone ground. Everything in and about the mine is running smoothly.

HAYWOOD.—Expect to have the road leading from the mine to the mill in Gold canyon cleared of snow in a few days, when the usual shipments of ore will again be made. Everything in the mine looking well.

GLADSTONE.—But little work has been done in the mine the past week on account of the late storm. The main tunnel will be started up again as soon as the snow becomes settled.

UTAH.—472 level.—The north drift has been extended 20 feet; total length, 154 feet. This drift is still in porphyry, clay and quartz.

HALE AND NORCROSS AND SAVAGE.—Owing to the absence of Supt. Keating yesterday, we are unable to give the usual report of the mines.

YELLOW JACKET.—Everything going on as usual; extracting about 100 tons of ore daily, principally from the 1300 and 1400 levels.

CHOLLAR.—The work of repairing the shaft still continues. The shaft is now in excellent condition down to the 800 level.

IMPERIAL.—Operations during the week were confined to the work of repairing the main shaft.

OVERMAN.—Extracting and shipping about 60 tons of ore daily to the Vivian mill.

THE SNOW.—The snow is said to be from 40 to 60 feet deep in several places on the north side of Mount Davidson, where it was blown into ravines or settled upon small flats. The store of snow now piled up in the Sierra Nevada mountains is greater than for some years past. This insures an ample supply of water for milling and all other purposes next summer, unless there shall come a season of warm rains in March or April; a visitation which is unusual and not much to be feared. It is not only in the Sierras that the snowy treasure is heaped up; there are goodly stores of it in all the mountain ranges in the State. This will in many places facilitate mining operations.

Bartlett Creek District.

GOLD-BEARING LEDGES.—Cor. Silver State, Feb. 23: I have some good news from the Bartlett Creek country. There has been considerable prospecting carried on there this past summer and this present winter, which has resulted in the finding and opening up of some fine gold-bearing ledges north of the canyon in which the creek is situated. The ground is not broken as it is at the creek and the facilities for deep working cannot be excelled in the country. It is astonishing that that section has remained unnoticed so long, as there is a belt of gold-bearing ore some eight miles in length that can be easily traced, and all of which prospects well. Besides, there are ores of silver chlorides and argentiferous galena, which elsewhere would attract instant attention, but the indifference of Humboldt business men and the distance from the source of supplies prevent the district from receiving the notice which it merits. There is every facility for the reduction of ores cheaply, as there is an abundance of water-power in every canyon of the range, plenty of timber within 10 miles, and a climate that admits of work the year around. The prospects that have been found last are lying in slate and free from waste. They lie at an angle of about 60 degrees, and though the gold

is very fine, still it is very easy to find pieces of quartz in which it is visible to the naked eye. The ore is chiefly brown in color and is very heavy, owing to the abundance of sulphurets of iron and copper in it.

Cortez District.

MINES BONDED.—Reno Gazette, Feb. 22: S. Wenban, owner of the famous mines at Cortez, Elureka county, returned home on yesterday morning's Central Pacific express train, after a visit of a week in this city and Carson. While at the latter town Mr. Wenban took advantage of the opportunity to call upon the assay office officials and ascertain what disposition he could make of his bullion to the governmental establishment. Supt. Garrard informed him that he is not authorized to purchase bullion, and could only assay, refine, and stamp any that is shipped him. The charges for this service are the same as at the Selby Smelting Works in San Francisco, and consequently Mr. Wenban could see no object in his favoring the Carson establishment, as to do so would necessitate extra freight expenses. Mr. Wenban has quite a pile of bullion that has accumulated at his mill during the past month or two. At the present time he is working only 18 tons of ore daily. It is high grade, yielding about \$200 to the ton. The mines are undoubtedly the richest discovered in this State in many years, and are bonded to a gentleman representing English capitalists for \$1,300,000. Mr. Wenban is indifferent as to whether the sale is consummated or not; in fact, he prefers to retain the properties, as there is more ore in sight in them to-day than ever. He and his family located at Cortez 23 years ago, when for a long time their nearest white neighbor was distant some 60 miles, and now that his mines, that extend along a range for a distance of over a mile, are meeting his most sanguine expectations, he is loth to part with them.

Columbus District.

SHAFT BROKE.—Walker Lake Bulletin, Feb. 26: Last Friday the main shaft of the Candelaria mill broke. Immediate measures were taken to have a new one made, and by vigorous work and extra time the railroad machine-shop finished the work in time to send it out and have it in place and the mill in working order yesterday. The Candelaria Water Works and Milling Company is now so well stocked with ore that extra expense for rapid repair is preferable to delay, and excepting from causes such as the above, there will be no cessation of work for a long time to come.

Esmeralda District.

HINDLEY.—Esmeralda News, Feb. 26: Messrs. Byrum & Rulofson, large owners in the Hindley mine, were inspecting the mine this week. Owing to the snowstorm, the roads are impassable, thereby delaying the shipment of ore, but it will be resumed as soon as the roads are opened. Thorne & Shannon continue prospecting the Evening Star, and as depth is attained, the ledge improves in size and quality of ore. They have a nice lot of good ore out, and expect to ship a carload to the Reno Reduction Works by the first of next month.

Gillis Mountain District.

BETTER PROSPECTS.—Esmeralda News, Feb. 26: The Gillis Mountain mining district is showing better prospects every day. B. G. Smith, Candelaria's merchant, has two men working on his Tip Top mine, which is a silver proposition. He has a large amount of silver ore on the dump and prospects in the mine are very flattering. Mr. Smith has stuck to this mine, and has expended thereon considerable money, and from present indications, it is confidently expected he will be amply rewarded. The Star mine is being worked by the Gillis Company, which has five or six men employed. The veins, though small, are very rich, producing money right along. The Virginia No. 1 looks well, the prospects are excellent, and but for the recent snowstorm a shipment of ore would have been made. Now that the weather has moderated, in a short time bullion will be produced from several of the mines in this district.

Grantsville District.

TO BE WORKED.—Belmont Courier, Feb. 26: It is to be hoped that the owners of the Alexander, Brooklyn, and other valuable mines of Grantsville will resume operations on them this summer. Both the Alexander and the Brooklyn have produced large quantities of bullion, and ought never to have been shut down. Work would be progressing to-day had these mines been properly managed. Of course it will take money to open and work them properly. The owners are fixed to work them in good shape as soon as they shall feel so inclined, which cannot be too soon to suit the people of Western Nye and Grantsville in particular. The ore bodies are low grade—\$20 per ton in silver—and of vast size and unknown extent. Heavy machinery and plenty of stamps will make it a remunerative investment to the owners when they have nerve enough to open these mines and work them as they should have been worked years ago. The ore is there, and will more than pay for extraction and reduction if the work connected therewith is properly conducted. The Alexander property today is one of the best mining ventures in the State, and we cannot understand why the owners allow it to remain idle.

Lodi District.

TO RESUME WORK.—Belmont Courier, Feb. 26: It is thought that work will be resumed on some of the Lodi mines this summer.

Mount Cory District.

MOUNT CORY.—Esmeralda News, Feb. 26: The Mount Cory Mining Co. is making arrangements to start their immense reduction works, four miles from here. The company has a large amount of pay ore on the dump and plenty more in sight in the mine. When they do start up the mill, which is expected to be about April 1st, it will be a long and continuous run, as the mine never looked so well as it does at present. It will give employment to a number of men and create better times generally. The company is one of the best on the coast, and their management always meets with success. It is reasonable to expect that this coming season will be one of increased prosperity for this section.

Tybo District.

DEVELOPMENT.—Cor. Belmont Courier, Feb. 26: All who are here are steadily at work and generally with good results. Mr. Dimick is making important developments in his property, and should all the work now in progress show such bodies of ore as there is every reason to believe probable, his mine

will become one of the permanent bullion-producers of the county. He has now at work seven or eight men, part of whom are slaking on a fine body of high-grade ore, and the others are driving a crosscut from his old shaft to tap the present ledge at a depth of 235 feet. When this work is completed he will be in condition to take out ore very rapidly. Gilmore Brothers are steadily working on their mine, and are encountering some fine ore with better prospects for the future. Mr. Trowbridge is having the hoisting engine and machinery put in thorough repair preparatory to the hoisting of the water from the 20 mine and the further exploration of the mine below its present workings. If the developments below the 8th level, 400 feet from the surface, are such as the past history of the mine makes almost a certainty, it means for Tybo another and better and more permanent lease of life than it has yet enjoyed. It means work for many men for many years to come and the addition of a continual stream of bullion to the product of Nye county. Mr. Trowbridge is also taking out of the old stopes of the mine large quantities of low-grade ore, running from 10 to 18 ounces per ton, which he proposes to work some time soon after May 1st. To most of your readers this grade of ore may seem to be absolutely valueless, but the time has come when mining men must look more to the large bodies of low-grade ores for future dividends than to the occasional bodies of rich ores that are found in our country.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Feb. 26: Line crosscut, 150-foot level, extended eight feet; total length 79 feet. The rock is very hard in both places.

NORTH BELLE ISLE.—North drift from No. 1 crosscut, 150-foot level, advanced 8 feet. The face shows the vein badly broken and very little ore. There is no material change to note.

NAVAJO.—Drift north from No. 1 winze, 350-foot level, has been advanced six feet; total distance, 22 feet. The face shows about two inches of good ore.

NEVADA QUEEN.—Since last report, work in the shaft has been suspended on account of the increasing flow of water. During the week, a station at the 200-foot level has been opened and will be finished in a few days.

Wild Rose District.

PARADISE VALLEY MIN. CO.—*Silver State*, Feb. 25: For week ending Feb. 21, milling ore produced, 31 tons and 1500 pounds. Average assay value per ton, 43.94 oz. silver; 0.26 oz. gold. Mill run 160 hours and reduced 105 tons. Mill work—Three Huntington centrifugal roller mills; six Triumph concentrators. Concentrates produced, 400 sacks, 32,760 pounds, par value \$5978.60, which was shipped to Boston and Colorado Smelting Co., Argo. Number of men on pay-roll, 98. During the week we have connected No. 5 winze, No. 4 tunnel, with the north drift 100-foot level, which has greatly improved the air, giving us a good steady current. The face of No. 5 tunnel is looking better, having small bunches of fair-grade ore, and indicates that we are on top of an ore body. Satisfactory progress continues at all points and everything is going smoothly at the mine and mill.

ARIZONA.

CHAUTAUQUA MOUNTAIN.—*Phoenix Herald*, Feb. 20: Among the great mining centers of Arizona is Chautauqua mountain, 35 miles north of Phoenix, on Cave creek. At the base of this mountain is the justly celebrated Phoenix mine, in which it is estimated there are over 1,000,000 tons of \$12 ore developed. The substratum of the mountain, as shown by the southern exposure, is sienite. This is capped with black slate for several hundred feet in depth, which, in the great upheaval that projected this center above the surrounding peaks, assumed a pitch corresponding with and forming the northern face of the mountain, the acclivity of which is about 35 degrees from the horizontal. This slate is seamed and scarred with a system of auriferous quartz veins from its apex to the base of the canyon at its northern base. On the summit is the great Chautauqua mine that has an exposure of 100,000 tons of ore, developed by the weathering of nature during the cycles of centuries. The Yellow Jacket mine is the northern extension of the Chautauqua, and while not having so great an exposure of ore, shows several large veins that can be traced through its whole extent. Three reports upon these mines made respectively by I. M. Taylor, of San Francisco, Sam Mc Masters (now dead), former superintendent of Haggins & Hearst's celebrated Deadwood mines in Dakota, and H. W. Kearsing, at one time assayer of the United States mint at San Francisco, fixed the average value of the ore at \$17.50 per ton, Mc Masters making it \$22; Taylor, \$17.50; and Kearsing, \$17. Adjoining and parallel with these mines are the Washington, Live Yankee, Lucille and Esmeralda, with extensions across the canyon, north, known as the Como and Denver. Major Ingalls, who returned from there last evening, having gone up with J. B. Norton, a San Francisco expert, brought home with him several sacks of ore from the Chautauqua, Washington, Live Yankee, et al., that is exceedingly rich, much of it showing brightly with free gold. This ore was shipped to Col. G. W. Lechner at Denver, Colorado, to-day, who has parties about to close with him for a portion, if not all, of the mines named. Mr. Norton emphatically corroborates all former reports on the mines of Chautauqua mountain, which is another proof that the *Herald* is correct in its claims for the value of the gold mines of Maricopa county and particularly Cave creek.

GREAT BASIN.—*Mohave Miner*, Feb. 26: We hear that Judge Schaefer has struck it rich on one of his Gold Basin claims. Sol. Rowe, John Fox, R. G. Patterson and other Gold Basin miners are doing well. Jim Mulligan had a lot of ore from the Flagstaff mine put through the sampling process. George Uetz brought up a load of ore from the Sandy country, but we did not hear how it milled. Bob Patterson is running his steam apparatus out at Grass Springs again on ore from his Gold Basin mines. Victor Coshina brought in about half a ton of high-grade galena ore from the Winchester mine at Stockton Hill last Thursday. Mr. Shippey came down from Stockton a day or two since, with five sacks of wonderfully rich ore, and left with a good-sized check in his pocket. P. Hatch had a carload of ore from the Indian Boy run through the sampling works last week, and also a small lot of rich ore from the same mine. William Miller is again at work on the Crescent mine, Peacock district, and sent in about five tons of very good ore from Wallapai

Siding last week which netted him a handsome sum. Mr. Miller is one of our most successful miners. Brown and Miller came in again last week with about a ton and a half of ore from their claim in the Weaver district, near El Dorado canyon, for which the sampling works paid them in the neighborhood of \$700. As these two miners average a trip about every two weeks with this grade of ore, they should be accumulating wealth.

RICHMOND BASIN.—*Arizona Silver Belt*, Feb. 26: Sheriff Hodson, from Richmond Basin, reports fair progress in the development of the Equity mine, owned by Bud Woodson, S. Klein and himself. They have some ore, but wish to develop the property in a thorough manner, and will do considerable more deadwork before stopping. They are sinking a new shaft and will soon begin a drift. Other miners at the Basin are doing well. Sam Sands, in sinking on his mine, went through eight feet of ore, and he is now drifting. The ore will go from \$500 to \$1000 per ton. John Cadman is also working his mine successfully.

COLORADO.

SALES.—*Denver Tribune-Republican*, Feb. 23: The Frontenac and Searle of Gilpin county, which were offered in London for \$750,000, are reported sold. Tally two. The United States placers, which sold for the same amount, constituted tally one. Now let the Cinnamon Mountain and the Gilpin county placers, which are offered in London at still larger figures, be sold, and Colorado will get a black eye which will prevent the sale of another mine in that market for a dozen years.

BOG IRON.—*La Plata Miner*, Feb. 19: In the vast bog-iron beds in the vicinity of Del Mino, there are thousands of tons of the finest kind of fluxing material for smelting purposes. It will probably be utilized by the San Juan and New York smelter at Durango, which has heretofore used mainly the Leadville Breese iron ore. This ore is getting rather scarce, and some difficulty is used in securing a supply, and this is one of the reasons for the change. Another reason is that the Interstate Commerce bill puts a stop to the special rates which this smelter has received on this ore. The Cement creek bog iron contains from two-tenths of an ounce to one ounce gold per ton.

SILVER BELL.—We understand from unimpeachable authority that the famous Silver Bell, the pride of the district, is to be sold. It has been quietly mooted for some time that the property was soon to change hands, but none thought the transaction was so soon to take place. The intending purchaser is the "Standard Oil Co."—or, rather, Crawford, Hammond & Co., of the Yankee Girl. Mr. W. H. Harvey came to the mine on the 10th, and paid all of his employees up to that date. He left on Sunday for Denver to complete the negotiations for the sale.

THE GUSTON.—The Guston is turning out its regular quota of ore. The ore seam holds its width in a fashion that is very pleasing to Mr. Gray. The fourth level has been started, and they are rubbing the drift with all possible speed toward the ore chimney. Meanwhile the shaft is continued on down to the projected fifth station, which will likely be the last station to be put in this shaft, as a new double-compartment shaft is to be begun early in the spring.

THE COPPER KING has about 75 tons of ore on the dump, and the pile is being added to every day. The mine is looking splendidly, and there seems to be no end to the ore. Yesterday, the crew ran on to another of the "open sesame" caves, which brings another bonanza in sight for the owners, Col. Pat Cahill and Count de la Ressoubes. With a continuance of such luck, they will not be long getting that \$50,000.

IDAHO.

SOUTH SIDE PROSPECTS.—*Coeur d'Alene Record*, Feb. 19: Placer miners along Trail, Potosi, and Pony gulches are jubilant over the prospects for this spring. The enormous amount of snow insures a plentiful supply of water until late in the season, and the owners of many of the best claims have been as busy as bees all winter building flumes and ditches and making preparations to conduct operations on an extensive scale.

TRAIL CREEK.—Among the Trail creek claims which are almost sure to contribute greatly to the Coeur d'Alene gold product of '87 are the McCauley, Nickerson, Horseshoe (segregated), Bosse or French claim, Myrtle, Miller and Black Hills. The last named will be the principal scene of the extensive operations of the Trail Creek Bedrock Flume Company, in charge of John Hermann. On the Montana bar claim, already noted for its outputs, the Van Dorn brothers have run an open cut to bedrock and expect to get more gold this spring than ever before.

POTOSI GULCH.—All winter Potosi gulch has been a scene of considerable activity. The owners of the Gallivan claim have done an immense amount of work and everything is now in readiness for active hydraulic operations as soon as they get sufficient water. The Mills claim is prepared for sluicing. Shuster and Range have dug a ditch one mile long to carry water for hydraulicking, and have built a flume 13 inches wide and 600 feet long. They have some of the best ground in the gulch and their prospects for a big run this spring are first-class. Hall & Co. have put in a flume for working their bar ground and are likely to be amply rewarded for all their outlay of time and money. At the mouth of the gulch Heller & Co. are prepared to make things lively piping rich gravel through their flume as soon as the rush of water comes.

PONY GULCH.—Up to the present time the profits derived from placer mining in Pony gulch have been slight. There is gold there, lots of it, but flumes and hydraulic appliances are necessary to make it pay. These the best claims now have, and the placer output this season is likely to be considerable. Since early last summer, when several large gold ledges were found, the *Record* has made frequent mention of the quartz prospects of Pony gulch. Considerable work has been done quietly by a few men and the results of their labors have astonished all who have gained a knowledge of the facts. Parties who have lately visited ledges where work is now in progress say that fine specimens of free gold are thrown out by almost every shot. The most sanguine ones predict that Pony

gulch will prove to be the great gold quartz gulch of Coeur d'Alene and that some of the ledges will rival the richness of the marvelous Treasure Box, while greatly exceeding it in size.

FLINT DISTRICT.—*Idaho Avalanche*, Feb. 26: We hear that the Idaho Mining Co., of Flint mining district, is now sinking three shafts from the bottom of the level of the Perseverance mine, and that ere long they will put hoisting works on one of the shafts. The company is also running a tunnel from the Leviathan to cut the Rising Star. It is the intention to work the Leviathan, Rising Star and Perseverance through one tunnel. Work is still progressing on the Star and the Evening. Fully 125 men are working in and around Flint. By spring it is expected that the mines will be well opened and the reduction works in operation. Mr. Stanton deserves great credit for the manner in which he has conducted the affairs of the company.

THE DURANGO GROUP.—*Wood River Times*, Feb. 23: The ore in the Durango not only holds out, but begins to justify the expectation that an ore body is not far distant. When first struck, a few weeks ago, only lumps or bunches of carbonates, carrying specks of galena, were found; these increased in frequency until a seam of galena was cut; a six-inch vein of galena, flanked on either side by a good width of concentrating ore, followed the seam, and the kidneys now give every indication of lengthening and widening into a large body which pitches to the south—or away from the Bullion-Ophir workings. Work in the Durango is prosecuted on three levels, which are respectively at depths of 300, 400, and 500 feet from the surface. All three levels are running in the direction of the ore body. As soon as that point is reached on either level, the others will be pushed as rapidly as possible—so that the property will be at once ready to ship a large quantity of ore. There will then be all of 3000 feet of "backs" ready for stamping. The Durango group is a monster property, as it includes all of 20 claims. That is, fully this number of claims owned by the same individuals are being prospected, or will be prospected, by the Durango workings. The principal owners are Craig Chambers, the Salt Lake millionaire, and Professor Jenney.

THE MINING OUTLOOK.—*Statesman*, Feb. 23: The outlook in all the mining camps in Idaho is very encouraging, and the indications point to a general revival in a number of camps where work has been suspended for one or more years, and increased productions in other camps. The sale of the Charles Dickens mine and the settlement of some lawsuits in the Bayshore district promise well for these camps; the new 50-stamp mill at Rocky Bar will give new life to that camp, the recent developments and additions of new machinery in camps in Owyhee county; the recent sale to capitalists of a number of mines in Washington county; the discovery of rich ledges in the Sheep Mountain and North Boise districts, all indicate that great activity will prevail in all the mining camps in Idaho next season.

OREGON.

GALICE CREEK.—*Oregon Sentinel*, Feb. 20: Chas. Saunders and Geo. Sturgeon came out from Galice creek last week. They report deep snow in that section and the miners jubilant. Mr. Saunders says there are extensive mines of both quartz and placer in that section, which, up to this time, have not been explored. He predicts a bright future for that section, because, he says, the mines are rich and time will bring capital which is alone necessary to make Galice creek one of the most important mining camps on the coast.

RICH STRIKE.—*Bedrock Democrat*, Feb. 26: We are pleased to know that Frank Skelton, an old resident of Baker county, has at last struck it rich in the Granite district. He has been energetically at work since last fall on a quartz lode and now comes a well-authenticated report that he has at last struck a vein of quartz that assays "way up." In fact that he has been enabled by means of a hand-mill to take out considerable of the shining metal.

GRANITE.—C. S. Miller, who it can be said has few equals as far as energy and perseverance are concerned, returned from Granite mining district yesterday. During his brief sojourn in the mountains his mode of traveling was by means of snowshoes, and judging from the many samples of quartz brought out with him, we think his trip was not without good results. Mr. Miller has great faith in the future of this district as a mining center, and from his long experience in mining on this coast, we think he is good authority.

NOTES.—*Jacksonville Times*, Feb. 26: Extensive mining operations will probably be resumed in Wagner creek district before long. The snow which lies in the mountains in great heaps will serve to extend the mining season a considerable period. Considerable work is being done at Hays & McGruder's diggings on Rogue river. C. O. Bigelow, of Williamsburg, is operating his hydraulic mines on an extensive scale this season, and will make a good showing. Another ledge of quartz has been struck in the Jacksonville Milling and Mining Company's tunnel on Timber gulch. F. Houatt and others are taking 150 tons of quartz out of the El Dorado ledge, owned by McKenzie & Co., which will be crushed by Klippel & Baume's mill as soon as the roads are in condition. A great many placers that have never been worked before will be mined this season. There is plenty of good ground in this region which is yet unworked, because enough water for that purpose is not available.

NEW MEXICO.

HANSONBURG DISTRICT.—*Socorro Bulletin*, Feb. 19: As a pointer of the renewed interest which is being manifested in the mines of this county, we cite the case of the Compromise mine at Hansonburg district, which was bonded from its owners, Chas. Blanchard, J. K. Lintz and Jeff Reynolds, for 12 months, by F. Wilson, of this city. The bond is for \$20,000. The latter gentleman last Monday dispatched miners to the mine. The blasts of the Compromise will awaken the echoes, which have been silent for so long, among the rocky gulches and summits of the mining districts of the Oscuras. Work will be prosecuted without intermission, and as the workings possess a full face of rich argentiferous and auriferous copper ore, the product will be shipped via the Carthage branch for treatment. The extension of this railroad artery to White Oaks

would be the signal for the resumption of work throughout the Hansonburg, Oscura, San Antonio, Little Burro, and other mining districts which have lain dormant since 1881, owing to the difficulties of access and want of economical transportation of mineral. We are happy to note this renewed activity in these camps, which will be accelerated by the railroad to White Oaks, and by the consummation of the extension of the branch from Magdalena to Albia will result at least in doubling the bullion and mineral product of this county. The Graphic smelter is now running its three shafts at full blast. The product of the Billing works during the month of January, 1887, was 600 tons of high-grade bullion. New discoveries of high-grade ore continue to be made almost every week in the Nogal and Bonito mining districts. The railroad has acted on our suggestion and constructed a switch to the slag dump of the Graphic smelter, and are now using the slag for ballast on their road. They will also, we are told, do the same at the Billing works.

IRON.—*Rio Grande Republican*, Feb. 26: Geo. Brown came in from the San Diego mountains the first of the week, where he has been locating an iron property. The ledge, he states, is an immense one, being several hundred feet in width, and the iron body is simply inexhaustible. Coal is said to exist in the same locality, and it remains for some enterprising company to take the matter in hand and make Dona Ana an iron-producing county as well as a gold, silver, copper and lead producer.

MONTANA.

THE ANACONDA.—*Butte Miner*, Feb. 23: Good news is received in regard to the Anaconda Co. A rumor was on the street early yesterday in regard to preparations being made at the Anaconda mine for the resumption of operations. Marcus Daly was at the smelter, and when approached upon the subject, said: "As a general thing I am opposed to this promiscuous interfering business. In this matter, however, I realize that the public in Butte cannot but be greatly interested. The Anaconda employs 400 men in Butte, and more than that in Anaconda, and so a large number of people must be anxiously watching for news in regard to its operations. Yes, the smelter will be started up this evening. We have now on hand about 1000 tons of coal, and have satisfactory assurances that more will be forthcoming when needed. We shall start up only half of the furnaces to-night. While there is the least uncertainty in regard to the supply of coal, we cannot make any experiments. Half the furnaces in each of the two smelter buildings will be started up to-night, and the other half as soon as our coal order is filled. The concentrator will begin operations about Wednesday or Thursday, and the mine at the same time." The reasons for the delay in starting up the mine and concentrator are that a supply of ore and concentrates is already on hand sufficient to run the furnaces several days. The new steam stamp and the automatic delivery of ore have greatly facilitated the production of the concentrator, and it is now able to keep ahead of the smelter all the time. There was general rejoicing in Anaconda last night as the news was passed from mouth to mouth.

AT WORK AGAIN.—*Butte Miner*, Feb. 26: As reported in Monday morning's *Miner*, the Anaconda Co. decided to begin work again. Half the furnaces were started up Monday evening, and the intention was stated of starting up the concentrator and mine in a few days. For the purpose of learning the further movements in this matter, a call was made yesterday on President Dana, of the Montana Union, who said: "The concentrator of the Anaconda will start to-morrow, as announced. We begin to-morrow to deliver ore from three of the company's mines, the Matte, the Anaconda and one other—I think the Wake Up Jim. For the present we will send over about 30 or 40 cars per day, amounting in all to about 700 or 800 tons daily. The smelter already has on hand about 2000 tons of ore, as we have been delivering a little right along. We shall gradually begin to put back the men that we were compelled to let go on account of the shut-down, and I think in a short time we will be working the full force as before. We have already asked for our five engines from the Union Pacific, which we let go down to help out below during the snow blockade."

UTAH.

PARK CITY.—*Record*, Feb. 20: There is no use concealing the foregone conclusion that Park City will have a big merited mining boom the coming spring and summer. The past record of the Park, present and prospective operations on both old and new properties, indicate a boom equal to any known for good and permanent results. The press of the country seem to realize this and are making it known. The new body of ore in the Apex lower tunnel is holding out surprisingly well in extent and value. Ten tons of ore are taken out daily, and as soon as the roads permit extensive hauling the output can be increased to 60 tons a day.

THE NEW STRIKE.—Early this week G. J. Barry, who has charge of the working of the Silas Reed group on Pioneer ridge, sent word to the heirs of the deceased Dr. Reed of the rich strike in the Silver Age tunnel. The find is big and valuable to the owners, who have spent much money on the property. Further details, other than that the vein of rich sulphuret ore is two feet in width, were not obtainable. It is not likely that the strike will be developed much until A. C. Anthony, executor of the Reed estate, comes from Boston to inspect the property.

REVIEW.—*Salt Lake Tribune*, Feb. 25: The receipts of ore and bullion in this city for the week ending the 23d inclusive, were \$100,620.74 in bullion and \$30,247.67 in ore, a total of \$130,868.41. For the previous week the receipts were \$64,210.98, of which \$101,045.88 was ore and \$63,165.10 was bullion. The output of the Ontario for the week was 24,280 fine ounces, and ore sales amounting to \$8832.37, a total of \$33,112.37. The Daly product for the week was 13 bars of bullion, 18,435.08 fine ounces, and \$4505.03 of ore sales, a total of \$22,940.11. Fine bar receipts for the week were \$19,014.35; base bullion, \$10,200; gold bars, \$2871; dore bars, \$1900. The Hanauer smelter produced for the week \$18,055 in bullion. Nothing can be learned locally of the Horn Silver, except reports that force and salaries are being reduced. The result would naturally be an even smaller output than that of the past.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival. Is in operation in leading smelting works and mills.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shaft line by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Glove Cases, free of cost, by applying to the manufacturers.

American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect accuracy, at reasonable rates and in the shortest possible time.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco.

TELEPHONE ELECTRIC RAILWAY CO., Feb. 27. Object, to engage in electric street railway operation. Capital stock, \$1,000,000. Directors—Julius Goetz, F. M. Speed, R. A. Wilson, Geo. H. Hoppes and F. W. Brown.

PACIFIC PAPER CO., Feb. 27. Capital stock, \$25,000. Directors—F. W. Ainsworth, G. H. Bartlett, F. R. Noyes, B. Noyes and Smith Bartlett.

CARY M. CO., March 2. Location, California. Capital stock, \$1,200,000. Directors—Vernon Wilson, Fred L. Lipman, Amos W. Huggins, Joseph Newbauer, Jr., and John de Vaul, Jr.

WOMAN'S EXCHANGE, March 3. The objects are the receptive exhibition and sale of all articles of woman's work, except such as shall be deemed by the officers of the society too perishable to be placed in the rooms of the society. The officers are: President, Rosalie Kaufman; secretary, K. P. Birdsall; Directors—Mary A. Swift, Emily B. Hopkins, Ellen L. Mayes, Ellen M. Wetherbee, Annie B. Dodge, Sarah Sloss, Matilda Castle, Lucille B. Forman, Katherine P. Birdsall, Cornelia F. Curry and L. Ashe. There is no capital stock.

CONSOLIDATED SEGREGATED BELCHER M. CO., March 3. Location, Nevada. Capital stock, \$5,000,000. Directors—Maurice Schmitt, M. P. Hall, C. A. Schmitt, A. Herman and Thomas Cole.

Mining Share Market.

Business in mining shares is comparatively light just now. There is not much news of note from the Comstock. In Bullion, the east drift from the station on the 200 level in the Croesus shaft is out a total length of 260 feet and is still showing low-grade quartz in the face. The west crosscut from the same station is up to the West Potosi east line, and will be carried into that ground by the management of that company. In Yellow Jacket during this current week 1700 tons of ore were extracted from above the 1300 level and shipped to the Brunswick mill. Extensive explorations are in progress between the sagebrush level and the 900.

The Consolidated California and Virginia has declared a dividend of 50 cents per share.

It is stated that some new mines in the Quijotoa region, Arizona, will soon be purchased and shares may be put upon the market.

Bullion Shipments.

We quote shipments since our last, and shall be eased to receive further reports:

Margat Ann, Feb. 27, \$4320; Moulton, 26, \$16,080; Pyrenees, 26, \$9000; Hanauer, 22, \$2732; Alice, 22, \$14,479; Hanauer, 24, \$3350; Bannock, 24, \$4100; Hanauer, 25, \$1900; 26, \$1900; Cons. California and Virginia, 27, \$48,000; total for month to that date, \$195,820; Eureka Consolidated, 27, \$22,048; total for month, \$65,000; Head Center and Tranquility, March 1, \$5321; Standard, 1, \$5612; Wells, Fargo & Co., shipped from Salt Lake last week \$73,881 in bullion; McCormick & Co., \$31,705; T. R. Jones & Co., \$10,797; Union National Bank, \$14,479.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARRN C. HOAG—California.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extreme small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

2 and 4 Stone Street, NEW YORK.

Write for Particulars.

New York Metal Market.

Telegraphic advice dated March 3d give the following New York prices:

BAR SILVER—\$1.01 1/2 per oz.
 BORAX—\$4.00 c.
 COPPER—\$10.11.
 LEAD—\$4.37 1/2.
 QUICKSILVER—\$3.00 c.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, spot closing at \$10.80 c. —. Transferable Notices (Lake) issued at \$10.75 c. —. Transferable Notices (Chili Bars) issued at \$10.10 c. —. Orford—Steady at \$4.45 c. 4.55 c. spot. Transferable Notices issued at \$4.52 c. —.
 This Firm at \$22.45 c. 22.55 c. Transferable notices issued at \$22.55 c. —.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$22.50 c. 23.00 c.; Billiton Tin, \$23.10 c. 23.40 c.; Banca Tin, \$23.15 c. 23.50 c.; Baltimore Copper, \$9.75 c. 10.15 c.; Banca Copper, \$10.00 c. 10.25 c.; P. S. C. Copper, \$10.00 c. 10.25 c.; Foreign Lead, \$4.80 c. 4.95 c.; Foreign Spelter, \$4.80 c. 4.95 c. —.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

ASSESSMENT NOTICE.

The Phelps Manufacturing Company.—Location of principal place of business, San Francisco, California. Location of works, San Francisco, Cal.

NOTICE is hereby given, that at a meeting of the Board of Trustees, held on the 12th day of February, 1887, an assessment (No. 1) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary of the Company, 17 Drumm street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 21st day of March, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 5th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. PHELPS, Secretary.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturer cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

STEAM BOILERS of all descriptions.
SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.
STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamhills, Pumps, Steam Capstans, Cargo Winches, etc.
Builders of 120-stamp Gold Mill for the Alaska Mill and Minlog Company; 60-stamp Mill for Quartz Mountain Mining Company.
Send for Circular and Price Lists.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and this GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS of 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other makes, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., of any DESIRED CAPACITY.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mins in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE TRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY of IRON, no pieces WEIGH OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft and is CAPABLE OF CARRYING 500 feet of five eighths steel rope. SEND FOR CIRCULAR.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, cog or pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ores, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ores on account of low cost of working.

Feeding Ores to Stamps.

Managers of mills, superintendents and mill-men admit that one of the most important and essential factors which contribute to the proper reduction and amalgamation of gold, silver and other ores, by the battery process, is their initial perfect pulverization under the stamps.

To accomplish this, automatic ore-feeders are now fitted in every well-appointed quartz mill. In the early days of California, the Golden State, when stamp mills were first introduced, the method of hand-feeding to the batteries was adopted; but it was learned that men oft-times drink, become lazy, sleep on their shift, were often inexperienced and always expensive, and the result of their labor was a costly wear of iron and an imperfect reduction of the ores.

Theory of Ore Feeding.

In order to reduce ore properly by the battery process, the theory of feeding must be understood. It is strange that intelligent mill-men should so often disagree upon this important point. The theory is simple, and a simple, practical illustration will prove it to be so.

Take an ordinary hand mortar and pestle, and attempt to pulverize a quantity of quartz; drop in but a small quantity, just sufficient to cover, in a thin layer, the bottom of the mortar, and it will rapidly pulverize under the blows of the pestle; drop in a large quantity, and the blows of the pestle will be ineffective, and time and labor lost in the effort to reduce it to powder.

In this lies all—the open secret of the theory—therefore let this rule be observed: To so adjust the rod leading to the lever bar of the ore-feeder, that the stroke of the tappet shall cause it to “feed low,” and then the desideratum of the “largest quantity of ore milled in the shortest period of time” will be attained.

Automatic Ore-Feeders.

The genius of Stanford and Cochrane supplanted this crude hand labor by the invention and introduction of “self” or automatic ore-feeders. The first device intended to supersede the expensive imperfections of the labor of feeding by hand was conceived by one C. P. Stanford, of San Francisco, and letters patent were granted to him about 25 years ago. This device consisted of a shaking table, having an “up-and-down” movement. In the original form of its construction, owing either to its crudity or opposition to its introduction, but few of them were manufactured and placed in practical use.

The Belt Carrier feeder, devised by Thomas A. Cochrane, was patented May 27, 1873, and, being constructed upon scientific principles, permitting of perfect automatic action, was successfully introduced into many of the quartz mills of this State, notably among which were the “App,” “Heslep,” “Patterson,” and others of Tuolumne county; the “St. Patrick” and “St. Lawrence,” of Placer county; the “Keystone,” “Lincoln,” and “Oneida,” of Amador county, and as well in other mining districts.

The next device was denominated the “Roller feeder,” but their rolling has certainly gathered but little moss.

The “Tulloch” was patented in 1873, but their sale has been limited, although they present some features which recommend their use.

Following these several inventions there came the “Challenge feeder,” which, in its improved form, we here illustrate, and letters patent for which were granted March 17, 1874, December

28, 1880, and July 21, 1885. It is pertinent to state that the use of the “Challenge feeders” has demonstrated the fact that 20 per cent more ore can be crushed with at least 15 per cent less wear of iron than by hand feeding.

From an examination of the recent improvements which have been introduced into the construction of these feeders, from the fact which has been brought to our knowledge that over 1600 have been placed in successful practical operation, we are assured that in their present form, as shown in the cut herewith accompanying, they are superior to other forms of feeder yet devised, and we take occasion to direct attention to an advertisement

perfection to which an automatic feeder can be and has been brought.

The changes which have been made in this feeder and now make it of an improved form are briefly as follows: The rock shaft in front, as shown in the accompanying cut, receives the blow of the tappet through the hump-rod, from the middle stamp of a five-stamp battery, and this obviates the necessity of constructing right and left-hand feeders as heretofore, and consequently the further necessity of ordering right and left-hand feeders or their parts, whenever same are required.

A further improvement will be found in the fact that the lever attached to the friction grip

“CHALLENGE” IMPROVED ORE FEEDER.

which appears in our journal of this date, in which the testimony of certain of the most reputable mining men of our State bears witness to the superiority of the “Challenge” feeders. It may be well to remind the superintendents of mining properties, or those who may contemplate becoming interested in quartz-mining enterprises, that they should note in their specifications when they may require milling machinery the superiority of the “Challenge” feeders. This leads us back to the initial point of this article, in which we state that “one of the most important and essential factors which contribute to the proper reduction and amalgamation of gold, silver and other ores, by the battery process, is their initial-perfect pulverization under the stamps, and to accomplish this, automatic ore-feeders are now fitted in every well-appointed quartz mill.” It is also proper to state that Mr. Joshua Hendy, manager of the Joshua Hendy Machine Works, Nos. 39 to 51 Fremont street, this city, has devoted many years of his life to the study of the true and practical principles upon which an ore-feeder should be constructed, and the illustration of the improved form of the “Challenge” feeder herewith presented shows the

is now placed outside of the frame, and the friction brake, as further shown in the cut, is now fitted on the top of the brake-wheel, and not underneath, as in the old form, and is, therefore, relieved from the grinding action of sand, etc. It is believed that this change of mechanism will permit of greater ease of adjustment in the operation of this improved form of feeders.

The Joshua Hendy Machine Works are also special manufacturers under letters patent, which they control, of the “Stanford Improved,” the “Tulloch,” as well as the “Original Roller” feeders, each of which has its special features of merit, but neither approaches the standard of superiority established by the practical operation of the “Challenge.”

SEVERAL trips since the steamer Granada carried to Mazatlan, Mexico, about 400 Chinese, who were to work in the mines about 100 miles north of that place. The mines did not prove the bonanza that the owners anticipated and the heathens were left in full charge of the mines without a sufficient supply of food.

THE Transvaal gold fields, Africa, are again attracting considerable attention.

Our Critics Abroad.

The New York newspaper press never tires of animadverting on what it is pleased to term the devious methods of the San Francisco mining share manipulator, about which methods there seems to be, in the estimation of these metropolitan journals, something especially reprehensible and crooked, one of them having only quite recently commented on the subject with much asperity. And this from a paper published in a city noted for the magnitude and vicious character of its stock operations, its swindling pools, wash-sales, bucket-shops, and like devices for entrapping the simple and unwary! “An ounce of civet, good apothecary”—nay, make it a pound—the subject is especially malodorous!

We have, to be sure, here in San Francisco, a couple of stock hoards, feeble concerns, whereat a few people amuse themselves buying and selling mining shares in a small way, as boys play pins! But how pitiful and innocuous these proceedings beside those carried on at the various stock hoards in the city of New York! As the shrimp compares with the whale, so do our stock transactions compare with those of this modern Gotham by the Atlantic seaboard! We have the untamed feline in our midst, it must be confessed; but ours is the comparatively harmless wild cat that merely growls and scratches—theirs the tiger of the jungle that kills and devours.

Then, be it observed, we confine our gambling to mining shares, employing only the implements and methods generally recognized as admissible in this sort of business. These New Yorkers gamble in everything and have recourse to modes the most slippery and indefensible. Nothing is too large and nothing too small to receive attention. They speculate in anything from United States bonds to shares in a hogus insurance company; from corners in flour, coal, pork, petroleum, kindling-wood, anything that the masses cannot well do without. The instrumentalities made use of are to them of no consequence. Wrecked railroad shares, a pack of cards, a dice-box—whatever comes to hand—is made to serve, so it enables them to compass illegitimate gains by illegitimate means. The San Francisco mining sharp, after graduating here, goes to New York to finish his education. It is the case, indeed, that such of the fraternity as find the moral atmosphere on this coast too pure for comfort, are apt to seek on the other side of the continent a habitat more congenial to their tastes and more favorable to their aspirations.

To such extent has the popular idea in many of these Eastern towns become familiarized with the language of the Bourse, that the clergy there are said to largely employ this nomenclature in their public ministrations, exhorting their hearers to keep good their spiritual “margins,” talking of theological “puts” and “calls” and “straddles,” and so on to the end of the stock sharps’ vernacular. The ways of the San Francisco broker are looked upon as guileless and provincial by these nabobs of the Eastern Bourse, who have glorified the Plutocracy by giving to it a new language and a new literature, and made mammon more than respectable by winning to it the countenance of the influential, and throwing over it the glamour of their ill-gotten wealth. We wager the scribe who pens these screeds for New York papers an old hat that he writes ignorantly!

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

South Fork Mining District, Shasta County.

EDITORS PRESS:—This district is situated about 12 miles southwesterly from the town of Redding, on the head-waters of the south fork of Clear creek, and is attracting no inconsiderable amount of attention at present, owing to important developments that have been made in the last few months in opening some of the many promising silver mines of the district. A brief notice of some of the more prominent mines, and a rough sketch of some of the surroundings and advantages of this interesting mining region, may not be uninteresting to the many readers of the Press at this time. This is one of the oldest districts in this part of the State, and has attracted little attention of late years, owing chiefly to the facts that its rich placers are practically exhausted, and its ores of gold and silver, being known to be base or refractory, it was long thought to be impracticable to profitably extract riches they were known to contain; in fact, many efforts were made to that end a few years ago, but nearly all failed, owing to imperfect appliances and lack of skill in treating the ores. Now, however, it is found these ores can be worked without difficulty and made to yield up their treasures at small cost.

Two miles to the northwest of the village of Igo, we find a large contact vein at the junction of the slate and granite. Several claims located on this lode show fine prospects for the work done. One mile further up the creek is situated the Grand Central claim, owned by P. Gibney and several other San Franciscans. This is a gold-bearing sulphuret vein, showing a width of over 20 feet where it is cut by their tunnel. Assays average \$20 per ton. Continuing up the creek, we next come to the Chicago mine, which had been worked spasmodically for a number of years, and has yielded a large amount of high-grade ore, which was mostly shipped to San Francisco and Denver, Col. This property, although badly "butchered," has lately passed into the hands of some practical mining men, late of Colorado, and who are at work to thoroughly explore and open it up. They have opened a new level and already have a fine body of ore in sight. There is a five-stamp mill equipped with two concentrators, a pan and settler, and also a 10-ton reverberatory furnace on the premises.

Just Over the Ridge

To the southwest and adjoining the Chicago, are the South Chicago and Red Warrior mines, opened by a number of tunnels and shafts, showing fine bodies of galena and sulphuret ores of high grade. Recent assays at the Continental Mine Assay office of Red Warrior ores yielded over \$100 per ton, the vein being six feet in thickness. These mines are owned by the Shirland Brothers. The surface ores of this district are what are known as ochreous, and are worked by the arrastra process for the free gold they contain. These ores are usually found cropping out at the surface and go down 15 to 50 feet, and sometimes to greater depth until water level is reached, and then galena and sulphurets take their place. In many instances these ochreous ore hear a large percentage of silver chlorides; usually, however, the silver has all leached out, leaving only the gold. The next mines up the South Fork a mile or so, is the Pacific group owned by the Shirlands and Hubbard. They have worked these mines for several years past for the free gold contained in the surface ore, which have yielded them an average of about \$20 per ton in the arrastra. They have a fine showing in all their workings of galena and sulphuret ores, many of them assaying way up in the hundreds of dollars per ton. Continuing up the stream half a mile, we come to E. L. Ballou's group of mines, consisting in part of the Great Falls, Hope and Manzanita. Mr. Ballou has been working the ochre of these mines for eight years and has made it pay very handsomely; he also has a large amount of base ores in eight all through the workings of his property.

The Chico Group.

Adjoining the Ballou mines on the northwest, and parallel with them, lie the Chico group, consisting of the Chico, Dayton, Smith, Florence and Chico North. The Chico was opened last summer by several open cuts, a tunnel and shaft producing several tons of high-grade ore. The Dayton has been opened along the vein for a distance of over 200 feet, showing a ledge from two to six feet at 40 feet from the surface, assaying from \$40 to \$200 per ton. The Smith mine, which is an extension of the Dayton on the north, has been worked for many years near the surface for its rich ochreous ores, which at the water level turn to sulphuret and galena.

The Continental Property.

To the northwest some 900 feet, and parallel to the Chico group, is situated the Continental Consolidated. This property was first located in 1868, and has been worked from time to time until 1881, when all work ceased except the yearly assessment. The parties then owning it expended a large sum of money in the construction of a five-stamp mill, a reverberatory furnace of ten tons capacity, and a number of large leaching tanks. They ran one long tunnel to crosscut their ledge, but unfortunately

ran it in the wrong direction. One hundred feet higher up the mountain, however, they sunk a shaft 36 feet and ran a drift from the bottom some 25 feet, and took out 100 tons of ore that assayed above \$50 per ton and attempted to work it in their mill, and by roasting and lixiviation. They made a complete failure, owing to the want of knowledge of any of the owners or employees in the treating of the ores. Their failure resulted in the closing down of the works, which remained in that condition until July last, when the Continental passed into the hands of Litten Bennett & Co., who became satisfied after a short investigation that only systematic development was required to make the Continental a valuable property. Fifty-five dollars being the average assay of the ore extracted by the former operators was considered a pretty good starter by L. B. & Co. The old shaft was cleared of water and debris and sunk to 50 feet. A drift was started from the bottom and ore at once taken out that assayed from \$60 to \$250 per ton, and as the drift was pushed ahead, the vein opened out so rapidly that it was too large to be all taken in the size of a working drift. The ore becoming more heavily charged with sulphurets and galena as the work progressed, occasional patches of rich silver were also encountered. This drift was continued 50 feet, when it was deemed advisable to crosscut with the view to ascertain the full width and strength of the vein at that point; this crosscut is now in 13 feet, showing a full face of high-grade ore. For the purpose of a proper understanding, we state here that the shaft is sunk on the base of a ridge, which rises abruptly toward the east, and the drift at the bottom of the shaft was pushed to the east also, following the hanging-wall, the end and face of the drift being now more than 100 feet perpendicularly from the surface. The outcrop of the vein on the surface shows a width of over 40 feet, and six large veins enter or connect with the main lode at intervals within a distance of a thousand feet, all showing mineral in paying quantities. Several years ago a tunnel was driven from the mouth of the shaft into the mountain, following the foot-wall for a distance of 110 feet. This tunnel shows a heavy body of high-grade ore all the way in. For 364 feet southwesterly from the shaft, and 100 below that level on the mountain side, the ledge has been exposed by an open cut, and shows a width of ten feet of quartz, which assays above \$25 per ton at the grass-roots. The ledge at this point has a two-foot gouge next the foot-wall.

Many Thousands of Tons of Ore

Are now uncovered on this property. Repeated tests, both by assay and milling, show an average value of all the ore to be above \$60 per ton. The Continental is without doubt an immense and valuable mine. Arrangements are being made to put in a plant with capacity to handle 20 tons per day of these ores. There is on the dump now over 400 tons, and from three to five tons per day is being extracted by the labor of three men. The ore is easily worked by roasting and milling processes. It carries from three to five per cent in lead, has a large percentage of zinc blende, a small quantity of copper and antimony.

There are many other promising mines in the district that only need development to make big properties of them. The natural facilities for the cheap extraction and reduction of the ores are all that could be desired, i. e., abundance of fine timber, splendid water-power, and good roads making them easily accessible from the railroad. Mines with abundance of high-grade ore are to be had at reasonable figures, and all that is required to make South Fork one of the leading camps of the coast is capital properly directed to develop its abundant treasures.

LIVE OAK.

Shasta Co., Cal., Feb. 24, 1887.

A MINING MILLIONAIRE.—A miner in Leadville, Colorado, who can neither read nor write, is worth to-day at least \$3,000,000. Four years ago he hadn't a penny, except what he earned from day to day as a miner. His name is John L. Morrissey. He is a young man, not over 32 or 33. The Crown Point mine, like Tom Bowen's Golconda, was just about paying expenses. Her owners offered to sell her for \$40,000. Morrissey went to Chicago and interested Diamond Joe Reynolds in the matter. Reynolds knew that Morrissey was an authority on mines, even if he couldn't write his name. He finally purchased the Crown Point, agreeing to give Morrissey a half interest after the original sum was repaid. Within 30 days they struck a vein of high-class ore that has yielded them a monthly income of \$18,000 apiece ever since. There is said to be \$5,000,000 worth of ore in sight. Morrissey cannot even tell the time of day. It is a stock joke among the boys if you ask him what o'clock it is, for him to pull from his fob a \$500 watch, and with a condescending air tell you to "luk for yourself, an' then ye'll know I'm not lyin' to yez."

BORAX.—Said the owner of large borax fields in Esmeralda county to a *Gazette* reporter yesterday: "The prices paid at present for borax are hardly calculated to create an immediate rush for such properties. They are very low, and have been for years. Yet I do not apprehend lower prices. I rather look for a gradual appreciation, owing to a perceptible increasing demand for the article. New and practical uses for it are discovered every now and then. The latest is to pack fresh meat, fresh fish, etc.,

with it instead of salt. A large shipper of fresh beef in Chicago recently told me that he finds it much superior to salt for preservation purposes, and it can be readily cleaned from the meat and leave behind no taste of it that is noticeable. He predicts that hundreds of tons of borax will shortly be used for this purpose alone every year."—*Reno Gazette*.

Unprospected Country in Montana.

There is a strip of country extending from the head of the Boulder range in a southeasterly direction to the Bitter Root valley, that is not only pronouncedly mineral but is, in a large measure, unprospected. What has operated as a serious bar to geographical exploration is the rugged and mountainous nature of the section throughout its entire length. In this belt occurs the great silver and gold deposits of Phillipsburg, Cable, Granite and Georgetown. Large deposits of iron ore, veins of copper, silver and gold have been located between Phillipsburg and Cable. The mines of Silver Lake and Mineral Hill, south of Cable, have produced in varying quantities for years a portion of the bullion output accredited to the Flint Creek district. South of Silver Lake the country is a veritable "Terra incognita." The heavily timbered Cable range has given place to a wilderness of snow-capped peaks whose solitudes are never broken save by the footsteps of some wandering hand of ibex. The canyons are masses of gloom, shadow and fallen timber. The mountain-sides are covered with slide-rock, and wherever the adventurous prospector turns he encounters natural difficulties that soon dishearten him from further research. All who have penetrated this section any distance confirm the report that quartz carrying more or less mineral is easily found. Would it not be well, then, for many who spend each year in looking up mines in sections like the Flint Creek that are easily prospected, to turn their attention to those portions of the country which have been avoided in the past for the reason above noted? To find a good mine is to make a fortune quick, and no finer field is offered the searcher after precious minerals than this one of the many unexplored sections of Deer Lodge county. We trust to chronicle in the spring many new discoveries in the Cable range.—*Phillipsburg Mail*.

RAILROAD FUEL.—The engines on this division—Sacramento to Truckee—now use coal almost exclusively, and by so doing, much valuable time—an hour and a half to two hours—is saved on an average in making the run between those places. This is the principal advantage derived by the company from the change, though the cost, we believe, is a trifle less than that of the wood. Another advantage is found in the consideration that the wood is becoming scarcer from year to year. Much of that lately or last cut for the company's use is small and sappy, being from young timber, and it was not therefore as well adapted for the purpose of steam producing as that of older growth. In the course of a conversation the other day with Mr. S. B. Talbot, fuel agent for the railroad company, we learned that during the coming season the company would need no wood whatever this side of the Summit, except such as had already been contracted for—that is to say, about 2000 cords to be furnished by J. B. Chinn, of Emigrant Gap, and about 6000 cords by the Yuba Valley Wood Company, of Dutch Flat.—*Placer Argus*.

THE UTAH SALT SUPPLY.—Our salt supply during the coming spring months is going to be considerable of a difficulty, if all reports are true. The roads bordering the lake are now in horrible condition and gradually getting worse, and the matter of getting salt to the cars is already a grave difficulty. The warm weather in the Great Salt Lake valley, together with the snow that has fallen, has rendered the roads almost impassable; hence the transfer of salt from the settling vats to the cars is a slow and tedious operation. We are informed that the Ontario laid in a supply last fall in anticipation of this same trouble, but as the evil is starting in so much earlier and will in all probability continue just as long, this supply is liable to get pinched very close before traffic is fully restored. We trust some means will be found to overcome the trouble before it resolves itself into a serious matter and threatens the mining interests of Utah.—*Park City Call*.

THE RENO REDUCTION WORKS.—Everything at the new reduction works is running smoothly. The company has on hand over 400 tons of ore, and the quantity coming in daily is more than enough to meet the working requirements of the plant. It is proposed to start up the new smelter tomorrow. The marble that was brought in some two weeks ago from the Inyo quarries for flux has been found to answer the purpose admirably. The company proposes to add to the plant this spring a refinery, and at least 10 or 20 stamps for the working of free ores. Two bars of bullion, valued at \$1909, were shipped on last evening's express train.—*Reno Gazette*.

THE CHICO CHRONICLE (Butte county) learns that a landslide in the mountains near the Sutter house, disclosed a lead of quartz showing free gold in abundance. It was, of course, located at once.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR COUPLING.—Wm. S. Doan, Sacramento, assignor of one-half to Wallace Doan. No. 358,190. Dated Feb. 22, 1887. The invention consists in the novel mechanism for guiding the link to its position in the opposing draw-head, and for controlling the insertion and removal of the coupling-pin. The object is to provide a practicable means for coupling and uncoupling cars, without having to go between them.

TUBULAR LANTERN.—Emile Boesch, S. F. No. 358,186. Dated Feb. 22, 1887. This invention relates to that class of lanterns in which the necessary draught or current of air for combustion is furnished through a series of tubes opening out above, and communicating below, with an air space under the oil font. The object of this invention is to provide a complete, effective, and generally superior lantern of this class.

GRAPE STEMMER.—Wm. H. Worth, Petaluma. No. 358,241. Dated Feb. 22, 1887. This improved device is especially adapted for stripping grapes from their stems and discharging the grapes at the instant of separation and without crushing. It consists of a horizontal revolving drum, having spirally arranged flanges projecting from its periphery, and an outer inclosing case of the same shape, having similar spiral flanges fixed within it, but at the reverse angle from those on the drum, the flanges in both cases occupying upward of two-thirds of the circumference of the drum and case, and, in connection with these, of a longitudinal flange projecting from the side of the drum, extending its whole length in the space not occupied by the flanges. In connection with the stemming device, which has a discharge opening at one end for the stems, a hopper or chute is employed to receive the separated grapes, and crushing rollers are operated in connection therewith.

ORE FURNACE.—Terry McGinnis, Anaconda, M. T. This invention relates to that class of furnaces which are used for treating mineral-bearing ores of all kinds, and it consists in heat and flame-directing plates or dampers, which are preferably vertically adjustable, and are let through the top or arch of the furnace so as to extend within the ore chamber of said furnace; in a partition or dividing wall separating the grates of the fire-box, and a means of securing it in place; in novel adjustable bearings for the spades or blades which are used in stirring the ore upon the hearth, whereby said spades or blades may be readily handled; in the peculiarly located draft apertures, and in various details of construction. The present style of stirring the ore on the hearth necessitates severe labor; but with the swinging plates or frames provided by this invention, this difficulty is overcome. The object of the divisional wall for the grates in the fire-box is to distribute the flame over the whole surface of the first floor or divisional hearth. The plates or dampers continue this distribution all the way through the hearth. The manner in which the divisional wall is secured prevents it from being worked down by throwing wood against it. Lower apertures supply air to the grates in the center and keep them cool. The upper ones, which go through the front arch, draw the flame into the ore chamber effectively.

DAMMING BACK WATER.—Mr. L. Tietjens, of Stassfurt, Germany, has recently patented a very ingenious method of damming back the flow of water in shafts by the application of the well-known fact that certain salts increase their volume very materially by the absorbing of water of crystallization in hardening. To accomplish this, he takes either calcined soda, anhydrous alum, kieserite, or oxychloride of magnesium, mixes them into a paste, and then immediately injects them through a suitably arranged pipe into the fissures through which the water flows. As this paste hardens, it swells enough to fill all the interstices of the rock and to render it thoroughly water-tight.

THE PELTON WHEEL.—The demand for the patent water-wheel invented by L. A. Pelton, of this city, continues to steadily increase as its superior merits become more widely known and thoroughly understood. The Nevada Foundry, at the corner of Spring and Wyoming streets, is busily engaged in filling orders. Quite a number of first-class mechanics are almost constantly engaged in this department, and the prospects are that the force will have to be increased soon, in order to meet the growing demand. So far this year, eight of the wheels have been sold. The last one to leave the foundry is for a Chicago firm.—*Nevada Trans.*

NEW PACIFIC OCEAN STEAMSHIP LINE.—The Canadian Pacific Railway, to which recently was chartered the Cunard steamships Parthia, Batavia and Ahyesia for its Pacific trade, has arranged to start its first line from Vancouver to Japan and China ports. The Parthia will be the pioneer steamer of the line, leaving Hongkong by way of Higo and Yokohama for Vancouver. Vessels will run monthly until new steamships are built. The line will connect with the Peninsular & Oriental and Messageries Maritimes Lines in the East India trade.

Mineral Resources of Santa Cruz County.

"Talking about the golden boulder, an account of which was published recently," said a Santa Cruz pioneer last Saturday in conversation with a reporter of the *Santa Cruz Sentinel*, "this amount, \$50,000, mentioned as being taken therefrom is entirely too high. There was about \$15,000 taken out; that's all. The article states that it was taken from a boulder, but this is a mistake, as the gold came from the under side of a vein which was discovered by a man named Hinds. With him prospecting was George Inskeep and one or two others. I saw this vein shortly after its discovery. It was about five miles from Santa Cruz, on a branch of Gold gulch. They were prospecting at the time in a little gulch that led up to the vein, and naturally came across the bonanza. The vein was on Davis & Cowell's ranch. There was much money expended in searching for gold in that gulch, but more was expended than taken out. The vein was cut at a depth of about 200 feet with a tunnel, but was exhausted, and no more gold in paying quantities was found."

"Do you remember when gold was first discovered in this county?" the reporter asked.

"I think that gold was discovered on Ben Lomond, near the old Williams Landing, in 1850. This was about the earliest discovery of which I have any recollection. Gold is scattered all over this county, but not in paying quantities. Gold has been found in little streaks in the same kind of rock as that from which the bonanza was taken, but, as I said, it was only in small quantities which never paid. When granite and metamorphic limestone showed itself, gold could be distinctly seen in small streaks. The Santa Cruz gold is worth from \$13 to \$15 an ounce in San Francisco, as it contains some silver. The same formation that carries gold in this county is also noticed in Monterey county. There has been much prospecting in Santa Cruz county, but no great discovery has resulted, as there is no coal formation in this county. The limestone does not carry any metal in it except a trace of silver and plumbago. The limestone has been declared to be fine building stone, as it takes a good polish and is very durable. The granite is of but little value, as it contains too many mineral substances that decay too rapidly. There is mineral oil (petroleum) in this county, as traces of it have been found in the mountains and other parts of the county. Much search has been made for petroleum, but it has not been found in quantities that paid for the working of it. I think that if any great discovery of petroleum in this county is ever made it will be near the beach. The asphaltum used for street purposes is a tarry residuum of a cut-petroleum bed, as the petroleum shows itself on each side of the ridges, having been cut through by the ravine. The amount of asphaltum in this county is unknown, as there are immense quantities of it. Davis & Cowell, A. Walrath, of Nevada county, and I. L. Thurber own the lands on which are the asphaltum beds. That on Davis & Cowell's is not known, as it has never been prospected. The asphaltum has been worked on Thurber's and Walrath's lands. There is an abundance of garnets in the granite portion of the county."

"Is there much gold in the black sand along the beaches?"

"Yes, the black sand contains gold; but it is difficult to save, and is of more value to work for the iron, of which it makes the best class, and is now being used for that purpose in New Jersey. In the gold, iridium is mixed in, and is difficult to separate. It is not generally known that diamond-point gold pens are pointed with iridium. The grains found in the black sand of this county are not large enough to be useful. It is a very valuable metal."

A Big Tunnel Project.

The probability of the abandonment of the mineral portion of the Reservation has revived the idea of running a tunnel through Mount Grant. Some years ago a party of capitalists began to make calculations as to cost, etc., but learning that they would have continual annoyance from the Indians, and that they would always be in fear of an order of removal, they abandoned the project. Now that there is likely to be a chance for unobstructed work, the same men have resumed the project, and are contemplating beginning work as soon as the Reservation line is withdrawn. The eastern side of Mount Grant is very steep, rising from the lake a little over 7000 feet in a distance of three-quarters of a mile. The mountain is traversed in all directions by mineral-bearing ledges, some of these very large, and much rich gold-bearing float-rock has been found. The tunnel will make depth faster than distance, and will, in all probability, cut some of the ledges from which the above-mentioned float-rock came. Whatever ledges may be found will be cut so deep as to be below the breaks and faults which have annoyed and hindered prospectors. The story of the Lost Mexican mine is known to nearly everybody in this section, and every year one or more parties organize for a search for the wonderfully rich ledge. Frequent discoveries of remarkably rich rock keep up the interest in this almost legendary mine, and as the size of some boulders which have been discovered indicates

an extensive formation, the lucky locator will undoubtedly be one of the richest men in the world. Old Henry Garner has for years worked near the headwaters of Rose creek searching for a big ledge, the float from which he has traced to that vicinity, and which he thinks may be a portion of the Lost Mexican. He has at times found immense quartz boulders containing gold, and has implicit confidence that he is near the ledge. This ledge and many others will, without doubt, be cut by the tunnel, and 7000 feet of vertical distance can be worked without the outlay of hoisting. The expense of running the tunnel will be great, of course, but not nearly so great as in many places where tunnels have been driven with less chance of profit and much less possibilities as to the measures of success.—*Walker Lake Bulletin*.

RAILROAD EXTENSIONS.—No time will be lost by the owners of the Donahue line in pushing forward the two large railroad enterprises projected by them during last season. In conversation with a reporter, Colonel J. M. Donahue stated that the plans, specifications, etc., of the extension from Cloverdale to Ukiah were now completed and work on the proposed route would be begun as soon as the right of way is secured. "The road," continued Colonel Donahue, "is going to prove very expensive to build, as there will be at least 4800 feet of tunneling to pierce. By means of these tunnels, however, we have secured a one per cent grade, which will enable us to operate the road almost as cheaply as that between Petaluma and Cloverdale. An exceedingly practicable route has been discovered for this road, and there will be no great curves or bends, and when the road is completed it will be almost in a direct line between Ukiah and Cloverdale." In reference to the other road, Col. Donahue stated that the surveys and plans for the road to connect the Donahue system with that of the Southern Pacific were completed. The projected route started from a point on the main line between Pacheco and Novara, running across the marshes to the Sonoma valley narrow-gauge, and utilizing its tracks for some distance, thence on to the Napa junction. Work on this route will be commenced within the next 30 days, and the road will be constructed with as much speed as possible. Colonel Donahue also stated that he had lately ordered eight very handsome passenger coaches for use during the coming season.

HOW INDIANS CAMP IN THE SNOW.—The *Virginia (Nev.) Chronicle* relates that during the recent storm, a denizen of Six-mile Canyon observed two Piute hucks preparing to bivouac in the snow. They had but one blanket between them, with which they enveloped their persons, carefully covering their heads and feet. They then lay down in a hole hurrowed in the snow, and by twisting their persons about, succeeded in hurrying their bodies to the depth of a foot or more. The next morning the man who had observed the Indians preparing their bivouac, saw nothing to mark the spot where they lay down the evening before except an elevation resembling a grave. Thinking the hucks had perished with cold during the night, he sallied forth, armed with a shovel, for the purpose of exhuming their remains. The first thrust of the shovel caused a sudden movement of the mass resembling a snowy grave, accompanied with an "Ugh!" followed by the Piutes rising to their feet and shaking the snow from their single blanket. Their bodies were steaming with perspiration in place of being frozen stiff, as the philanthropic resurrectionist expected to find them.

MINERS' PERMANENT ICEHOUSES.—The miners in the dry districts are having a busy season. They never before had such an opportunity for laying in a water supply, and barrels are in demand. Some of the boys are storing snow in great quantities by packing it in old tunnels. These old tunnels with their crosscuts form excellent and substantial icehouses and next summer the enterprising individuals who have made ice while the snow lasted will be in comfortable circumstances. The snow is wheeled into a tunnel and solidly packed so that during the night it becomes almost ice; this operation is repeated daily, and two men can, in a few days, put up enough to furnish an abundant supply for a year. Next summer, visitors to the dry districts will be surprised and delighted when they receive a drink of ice-water instead of the expected lukewarm liquid.—*Walker Lake Bulletin*.

NYE COUNTY MINES.—The mines of Nye county, Nevada, during the year 1885 produced 233 tons 910 pounds of ore, valued at \$22,001.26. In 1886 they produced 7450 tons 1845 pounds of ore, valued at \$225,264.50. It is predicted that the value of the ore output for the year 1887 will more than double that of 1886. In fact, it is safe to say Nye county will soon rank with the big bullion-producers of the State. Recent developments in Ophir, Tyho, Reveille, Spanish Belt, San Antonio, Morey and Union mining districts are very encouraging.—*Belmont Courier*.

ONE EFFECT OF MELINITE.—General Brailmont, who has been experimenting in Belgium with the explosive melinite, has advised the Roumanian Government to suspend labor on the defensive works around Bucharest, as it will be necessary to devise new plans to withstand the new explosive.

Hermosa.

A Camp Coming to the Front.

Very little has been said in the newspapers of New Mexico about the camp of Hermosa, lying as it does (as the crow flies) 15 miles north of the flourishing town of Kingston, in Sierra county (formerly Socorro county) and 25 miles by the winding trail through the mountains. A correspondent of the *Socorro Bulletin* says: Hermosa has a future equal at least to Kingston. It is on the same mineral belt, and has been a producer of the precious metals for several years. The camp has been self-sustaining, without any particular effort having been put forth by the few miners working to induce capital to take hold, and as so much development work is necessary to put mines (generally) on a paying basis, we claim for Hermosa at least more than the average, because through the physical exertions of a few men without means the camp has been a steady producer and has the name of shipping to the Socorro smelter the highest grade ore received from any one section in New Mexico.

To go into detail about each good prospect or paying mine of Hermosa, or Palomas district, as it is called, would take up too much space; hence I will only mention a few of the most promising properties, leaving to future development a place in your paper as they come to the front. The mine having the largest amount of development and a steady producer is the Palomas Chief, with nearly 2000 feet of shafts, levels, etc. The Chief is owned by Lewis, Doran & White, the latter being its present manager. The Chief has been, and is to-day, a mine in the full sense of the word. The deeper it is worked the richer and plentier is the ore. On the same belt is the Eagle, Pelican and Albatross, a group of mines that has produced thousands in the precious metals. This group is now under bond to a St. Louis company and will likely change hands. Two miles south is the Big Tree mine, owned by J. C. McCoy (on the same contact), one of the most likely properties in the district and a producer. It has shipped ore worth from \$200 to \$1000 to the ton. Further south from the Big Tree, on the same contact, is Grover Cleveland mine, owned by Judge Brinker, Attorney-General Smith and others. This mine is being worked right along with promising results. The Antelope has shipped over \$25,000 worth of ore, and the Ocean Wave and Longfellow have added their annual portion to the output, as well as the Humming Bird. Numerous other mines have made shipments of ore, and the dumps are full of rock worth from 30 to 50 ounces awaiting the operation of the mill at Chloride, which is the Russell lixiviation process of treating ores.

Twenty miles north of Hermosa is the town of Chloride. Here are being erected the lixiviation works to test the ores of the range. C. J. Goff, brother of the Hon. Goff of West Virginia, is manager. They expect to have the process in operation some time in March. Among the best mines are the Silver Monument, St. Cloud, Nana, Wall Street, King No. 1 and 2, and a host of others.

Visitors to the Lick Observatory.

In a recent interview, Prof. Holden, of the Lick Observatory, said: "To do justice to the large telescope and to its situation, we must have a large staff of astronomers and the leisure to work in. The recent addition to the University income was made with the distinct understanding that something over \$10,000 per year should be devoted to the support of the observatory. The income from Mr. Lick's gift will be about \$9000, and so the total income will be about \$21,000. The chief part of this I hope will be spent in paying the salaries of the very best observers who can be obtained. I have already promised to nominate to the Regents Mr. Burnham, of Chicago, Prof. Comstock, of Columbus, Ohio, and Mr. Keeler, formerly an assistant to Prof. Langley, at Allegheny, as astronomers. I hope also to nominate two other observers (whose names I withhold) and a secretary. These gentlemen and myself will do the observing, and we shall need a machinist and two janitors to help us. The President of the Lick Trustees, Captain Floyd, hopes to turn over the observatory to the Regents in July next, and he is making every effort to do this. He is even spending the winter on the mountain in order to hasten the work."

"One thing I mentioned just now as an indispensable prerequisite to our work was the leisure to work in. I mean that while we are at work we must not be interrupted in any way by visitors or by anybody. You can easily see that no work of any value can be done unless it is continuous and consecutive. I mean to devote two nights per month of each of the summer months to the recognition of visitors at night. We shall have all our observers there at the three telescopes (6-inch, 12-inch and 36-inch) to show visitors three interesting objects (one with each telescope), and to give such explanations as may be asked for. We will give the whole of our time for these two nights per month to this, and in return we expect the public to see to it that we have the other nights of the month entirely free for the legitimate use of an observatory. If we do not

have this free use of our time, the observatory will, no doubt, be a disappointment to its friends everywhere, and it will be a failure, and deserve to be. But I feel sure that the very intelligent public of California is going to see to it that its astronomers have every possible facility for doing their legitimate work."

Tombstone Ores.

A Lack of Lead Ores in Southern Arizona.

The ore of this camp, says the *Tombstone Democrat*, has been mined only above water level, and at first the silver was almost entirely in the form of a chlorido, or, as it is commonly called, "horn silver," inclosed in a gangue of quartz, containing also lead carbonate, manganese and iron oxides, the Vizona being, perhaps, the freest of all the ores produced here, while the Girard was decidedly the basest. The gold and silver tellurides existed quite abundantly at one time in the Girard, occupying a position between the zone of extreme oxidation and the water level. The general opinion is prevalent among mining men that the silver will ultimately change to a sulphide as depth is reached, and in time our mills will be replaced by smelters. Then comes the great question of lead. It might be said the ruling problem of to-day is: "Where are there sufficient quantities of lead in Southern Arizona to supply our need?" If it is the problem of to-day, imagine the enormity of the same problem in the near future. Prospectors, mind you keep this; keep your eyes open for lead; the carbonate is preferred, but galena will do. As sure as you live, it will be worth as much as a gold mine to you.

An insufficient quantity of lead compels the Charleston smelter to run on a very low lead charge, often as low as five or six per cent. An insufficiency of lead compelled the Woranoco smelter to shut down altogether.

In this camp we have no mines that are strictly lead-producers. The Ingersoll mine, from the lower levels, produced some lead, but as an offset, it also carried a quantity of zinc. There are a few mines of the Bunker Hill and Luck Sure type that carry enough manganese and iron to take care of its own silica, leaving the small percentage of lead free. Such ores are desirable. Mr. White is credited with saying that "the Contention will pay more dividends from the ore taken from below water level than it has from the ore taken out from above." If so, and if the ore changes to a sulphide, does not this mean a smelting proposition? and does not this call for more lead? Yee, and for more lead than we are able to supply. We therefore call the attention of every prospector in Southern Arizona to this point: that the lead is what we want, and it is worth your while to look for it.

HEATING RAILROAD CARS.—The New York Board of Railroad Commissioners, in response to a joint resolution of the State Legislature, has reported upon the question of safety from fire in railroad accidents. It finds that heating by steam from locomotives is not feasible in general railroad service. Its recommendations are contained in a bill which prohibits the use of stoves in passenger cars, inside or out, unless so constructed and guarded as to prevent the car from taking fire under any circumstances; prohibits the use of oils in lamps of less than 300 degrees fire test; prescribes floorings on bridges and cat-heads strong enough to support derailed cars, with guard rails on them and their approaches, to guide derailed cars back upon the rails, and pressable guard posts at approaches to bridges to catch a blow from any derailed car instead of the superstructure of the bridge itself. A minority recommends the heating of cars by steam from the locomotive and objects to kerosene for lighting. Bills to those ends have been presented.

THE LEADVILLE CARBONATE BEDS.—Colonel J. M. Grant and George C. Smith, prominent mine-owners of Colorado, are at the Palace, in this city. "Leadville," said Colonel Grant enthusiastically to a reporter, "never was better than now. You don't hear anything about it here, but it is going right along. About '83, people thought the bottom had fallen out, real estate went away down, and a good many moved away. But the owners of the old mines went deeper and reached thicker and richer contacts of carbonates than they had ever had before. Leadville now produces more ore than during the wild times of '79. Real estate has gone up 50 per cent in the last year, and a number of fine brick blocks have been built, among them the Tabor Grand hotel, costing \$500,000."

PRICE OF NAILS.—The Western Iron Association met at Pittsburgh, Pa., last week, and unanimously decided to reaffirm the card rate. The meeting was the largest that has been had for years, all mills west of the Allegheny mountains being represented, and it was considered certain that prices would be advanced; but after a thorough discussion manufacturers deemed it best to make no change for the present. Trade was reported unusually good for this season of the year, and a prosperous year, undisturbed by any wage trouble, is looked for. The failure to advance prices was a disappointment to workmen, as an increase in the card rate meant higher wages for all skilled employes.

Passing Events.

The defeat of the Walrath debris-impounding bill, in the Legislature, is a severe disappointment to the hydraulic miners, who were in hopes they would, under its provisions, be able to work their mines without injury to any one else, and with profit to themselves.

The engineers, not only on this coast, but elsewhere, will have little to do for some time on river and harbor improvement work, the bill making the appropriations not having been signed by the President. Several works of magnitude on this coast, such as Oakland harbor and Wilmington harbor, will suffer temporarily.

The plans for rebuilding several horse-car lines in this city, and making cable roads of them, as well as the proposed extension of existing cable roads, will give plenty of work to mechanics this summer.

There is a good storage of snow in the mountains this winter, and the water supply for the coming season will be abundant. Water-power is much more largely used than formerly in this State for mining quartz mills.

A METEOROLOGICAL SOCIETY station has been established on the grounds of the State University at Berkeley, in connection with the observatory on the hill north of the North Hall building. It is in charge of Professor Frank Soule. Daily barometrical and thermometrical records, as well as those of relative humidity and precipitation, etc., are kept.

Free Trade and Bimetallism in England.

"Lo! after these many days," England, for so long a time the staunch and inflexible advocate of monometallism and free trade, is beginning to go back on her favorite theories, which there is now reason to believe she will soon be forced to abandon altogether. Her manufacturers are everywhere clamoring for protection, and almost the entire business community for the remonetization of silver. Protests against the admission of free goods and the exclusive use of gold, which only a short time since were few and feeble, being treated with derision when heard, are now loud, numerous and persistent, showing a settled purpose on the part of the protestants to force an early repeal of these obnoxious measures. In a few years more the policy of England will, beyond any question, be in accord with that of the United States, on one and perhaps both of these questions. While it may take a little more time for her to abandon or radically modify her free-trade doctrines, the reinstatement of silver into the currency of the realm will very likely occur within the time mentioned, many of her leading financiers and publicists having declared strongly in favor of such course. It is expected that a royal commission appointed to inquire into the expediency of restoring silver to its former function in that country will report in favor of the same. Should they do so, action favoring the remonetization of this metal would, presumably, be taken in both France and Germany, both of which countries have the matter now under consideration.

The English are notoriously a slow-moving, not to say an obstinate, people. Once committed to a practice, or even a theory, John Bull adheres to it with a pertinacity that nothing but the most obvious self-interest can overcome, his pride of opinion sometimes preventing his yielding even to this. Once resolved upon a change, however, our English cousins are not slow about carrying it out. Hence the probability that England will soon return to the double standard. That the free coinage of silver in this country will ultimately be restored may now be accepted as a foregone conclusion. To this fact, coupled with the improved prospects of silver in insular and continental Europe, is due the recent appreciation in the price of that metal in all the markets of the world. As the attempt to ostracize silver in the United States has been given up as hopeless, so also it may be expected that further opposition to its unrestricted coinage will here meet with early abandonment.

Cable Roads.

San Francisco is noted everywhere for her splendid system of street railroads operated by underground cables. There is probably no better street railroad in the world than the Market-Street line, in this city. The cars are roomy and clean, run frequently and fast, the track is smooth and the fare cheap. Visitors here ride on these cars for the mere fun of riding. The several other roads in the city, combined with the different lines of this one, give access to portions of the city which were before their construction comparatively valueless. Large areas of land have been made available for residence purposes, and the growth of the city largely extended by reason of the presence of these roads.

It is now announced that the Market-Street Company, or its managers, have secured the control of other roads in this city, and those which have heretofore been operated by horses will have cables instead. They paid \$1,000,000 for the Mission-Street horse-car line and will put in a cable. The Turk-Street or Central line, operated by horses, will also be made a cable road. The Geary-Street road, one of the purchases, is already a cable road, but will be greatly improved. The Sixth-Street line is a good piece of property included in the purchase. The rebuilding and equipping of all these roads will be a good thing for the mechanics and laborers of this city, as the new owners care to have nothing but first-class work done. All these plans show the confidence of capitalists in the present and future of San Francisco.

HENRY WARD BEECHER, the most noted clergyman in America, and one of the greatest orators, died at Brooklyn, N. Y., on Tuesday morning last.

Mining in Sonora, Mexico.

Mr. T. G. E. Wolleb, who is well known in this city, has been for some months engaged in mining near Hermosillo, Sonora, Mexico, and came to San Francisco last week for the purpose of purchasing some machinery for opening a small mine. In an interview with him, some points were elicited which may be of interest to mining men. On asking him if there was much mining going on around Hermosillo, he said:

"Well, no; there is not much mining going on there—not much serious mining. The Mexicans are scratching around some, but it does not amount to much. As soon as they have lost a pay ledge they do not go far; they soon give it up. An American who is willing to do some good work has a good chance there. There was a mine which they had worked some and given up. From the general outlook, I considered it was a paying ledge, and went at it. I sank only some 50 feet through the rock, and when I struck paying ore, they thought it was remarkable."

"Are there many claims of that kind here?"

"Yes, there are a good many abandoned mines—mines that have been worked some and given up. I have been offered one in Sahuaripa. It is an American doctor who gave me the description of it, but I have not seen it. He says it is a gold quartz ledge about 15 feet wide, and the rock averages \$40 to the ton. There is wood and water in abundance, and it is only two days from Las Prietas, with a good road. That mine was abandoned on account of the Apaches. These Indians were, as you know, very troublesome for a long time, but there is little trouble from them now. The Mexicans stand in great fear of them, and would not go in there for love or money. This doctor spoke to me of another mine, a ledge some eight or ten feet wide in quartzite and granite. There is water enough there, but it is some 60 miles from the railroad, and in a rough country. All these mines I have spoken of are in 'the Apache country,' which is one reason why the Mexicans have not worked them more."

"Are these opened or developed mines?"

"Some of them are open mines and some are not. The mine I spoke of working has been opened by others."

"Are there many Americans down there?"

"Yes, some; but people seem to be afraid of the Mexicans. They talk about the Mexicans coming in and driving them off, and all that sort of thing. I think it is all hosh. If they treat the Mexicans decently, it is all right. Of course there are a good many rough characters that come in there, men who have 'left their country for their country's good,' and so on, and they often get into trouble with the natives. But if one treats the Mexicans fairly, and lives up to the laws, he will find little trouble. The Mexicans are smart enough to distinguish decent people from the roughs. There is some talk of organizing companies to take up mines, but there is no need of that—every one can do it. If you observe the laws strictly and mind your own business, there will be no trouble."

"Some of these mines are pretty rich, is it said?"

"Yes; Las Prietas takes out from \$60,000 to \$80,000 every month in gold, and ships it. There is an American who ships from Hermosillo nearly a carload of argentiferous lead ore every day."

"In taking up a mine, either abandoned or otherwise, what is the mode of procedure?"

"You have to file a notice with the recorder of the district, in duplicate, and that notice is advertised by posting it at a public door, or in some other conspicuous place, and you have four months' time in which to open the mine. After awhile the mine is visited by the recorder and measured, and possession is given, if there is no other claim. You have to do a certain amount of work every six months, in order to hold the mine."

"You were speaking the other day about some large mine; where is that?"

"I was speaking of a gold mine; it is at Las Delicias. The mine is called St. Helena, and the ore is worked at Las Delicias. It is worked by a Boston company, which has spent over \$1,000,000 in opening and working it. It is in the district of Arisaps. It is worked according to the Boston metallurgical system, which consists in taking out \$4 per ton, and leaving \$8 or \$10 more in the tailings. They have tried different kinds of machinery and various processes,

and have lost lots of money in it."

"Is it all gold?"

"Yes, it is all gold in that mine. They have a whole mountain of quartz to work on."

"You are going to take a rock-breaker back with you, I understand?"

"Yes, I am here for the purpose of procuring some small machinery; but first I mean to sink lower down on my ledges. Now about these gold mines—if any decent man wants to go in with me, I can put him on track of some good openings."

"The gold deposit you mention is in the Sierra Madre, is it not?"

"It is mostly in the Sierra Madre. It is in the valley of the Rio Sonora, which comes down from the line."

"That region has been practically abandoned for many years, has it not? It is only within a short time that much prospecting has been done?"

"Yes, because the Mexicans are very much afraid of the Indians. There is not much danger from them now, though there is said to be a band of Apaches in that section; but it is not probable."

"The country is now safe, then, for prospectors to go into?"

"Yes, reasonably safe; and considerable prospecting has already been done in the Sierra Madre. I have been told that on the other side men have prospected for years and yet have found nothing. I have been advised not to go into the Sierras prospecting at all. Men have told me that they have worked and prospected for years with no result. And then others will tell that they have seen a ledge 40 feet wide, with plenty of wood and water, but that it was in the midst of the Apache country. They will be willing now to show you the place for a consideration. Of course, these people are not always to be depended upon, and if such a mine is offered to me I shall send some one I can depend upon to see it and report. The Mexicans, especially, are unreliable. They are not even to be relied upon as laborers; they will leave you at any time, often when you are most in need of them. They have even learned to strike, and will often quit work unless you raise their wages."

"Most of the mines are carried on by Mexicans, are they not?"

"No; I know of five or six American companies—Eastern companies—with large capital. There are quite a number of English companies, too. The principal company is English—in Trinidad. They have spent over a million and a half on their mine, and over \$100,000 on a road alone."

"Is there anybody from this State down there that you know of?"

"No. Californians are very few in numbers down there. But, by the way, it was only a few years since that a 'California mining expert' was there who astonished the natives. He lived high, drove around town in a four-horse carriage, and cut a swell generally. He hired a brass band to play for him daily, gave the boys \$5 for holding a horse, gave the hand-leader \$20 extra when a piece of music pleased him, and acted generally in an extravagant manner. It was done to impress the people with his own importance and the liberality of his company. He is said to have spent some \$8000 before he saw the mine he was to 'expert' on, but the venture never came to anything."

"How do you go down into Hermosillo?"

"We go by Southern Pacific to Benson, and then by the Sonora railroad to Hermosillo. It takes three days and nights from this city."

"Are there many foreigners down in Hermosillo connected with mining matters?"

"There were last year a good many—some Englishmen, some Frenchmen, and other nationalities. Just now there is a good deal of French capital going into Lower California."

"You think, then, that there is a good chance for some one to get bold of small mines?"

"Yes, or even large ones."

"A good opportunity for the investment of capital there?"

"Yes; but so much capital has been invested there and lost, either by careless investment or poor working, especially by Eastern companies, that people are a little afraid of it now."

"They brought out Eastern people to work the mines, I suppose?"

"Yes. Eastern people think they know more about mining than any one else, and

MECHANICAL PROGRESS.

Man-Hole or Hand-Hole Plates.

It is a mistake, says the *Locomotive*, to suppose that because a man-hole or hand-hole plate is packed with a gasket made of rubber or other yielding material, that any sort of surface on the plate and frame or ring is good enough to insure a tight joint when the plate is screwed up, for it is far from being the case. A man-hole plate and ring should each have a flat, smooth surface, for then a joint can always be made perfectly tight with a minimum amount of screwing up on the plate. Where the frame is uneven it is quite possible to screw up a plate with sufficient force to crack the ring, and some very destructive explosions have occurred from this cause. This is especially apt to occur where the frame is one of the ordinary external kind, for then the weakest part of the frame, owing to the convexity of the shell, is exactly where the greatest strain from steam pressure occurs, and as such frames are generally constructed they are altogether too light to give a proper margin of strength. It should not be forgotten that the cutting out of the shell on top for a man-hole weakens it very much, and the man-hole frame should be strong enough to restore the full amount of strength thus lost. This is best fulfilled by an internal frame, for, although the internal frame is much more inconvenient for entering the boiler than the external one, its strongest part comes just where the greatest amount of strength is needed, and it should always be used on boilers over 36 inches in diameter.

When a joint supposed to be well packed leaks when steam is raised, excessive tightening up of the plate should not be resorted to; the pressure should be relieved, the plate removed and the joint examined to discover the cause of the trouble.

Hand-holes, although they require no strengthening ring to compensate for the loss of material where they are cut out, should, nevertheless, be very carefully made. Especial attention should be given to making a smooth seat on the interior surface for the gasket to rest against. This is, of course, an easy matter to attend to in new work, but, as often happens where a hand-hole is cut in the back head of an old boiler, and the iron is laminated or of an inferior quality, it is not always an easy matter to make a good job. Under such circumstances it is sometimes nearly impossible to get a smooth seat. When this is the case it is very difficult to pack the joint so that it shall be tight with the ordinary rubber gaskets found in the market. Unless it is tight, corrosion very soon completes the bad job already begun, and in many cases a patch on the head has been found necessary. All this may be avoided by the exercise of care and a choice of suitable material for packing.

PROPERTIES OF MANGANESE STEEL.—Prof. W. F. Barrett has investigated the physical properties of manganese steel, and given his results in a paper to the Royal Society of Dublin. Two wires of No. 10 S. W. G. gauge were drawn for him by the makers of this steel, Messrs. Hadfield & Co., of Sheffield. Their density was 7.808, and one was softened by sudden cooling; the other was kept hard. It is a peculiarity of this steel, which contains from 12 to 14 per cent of manganese, that sudden cooling softens it, whereas slow cooling hardens it. No. 19 wire was found to have an electrical resistance of about one ohm per meter. The specific resistance in C. G. S. units was 77,000 for a cubic meter. Ordinary iron is only 9800. Mr. Barrett recommends it for electric light resistance coils. The steel is very slightly magnetic, its susceptibility to induced magnetism being only 300, as compared with 100,000 for iron; hence it is adapted for dynamos, head-plates, and ships' hulls. The tenacity of the hard wire was found to reach 110 tons per square inch, whereas the soft wire had a tenacity of only 48 tons per square inch. The modulus of elasticity was found to be lower than that of wrought iron, the mean number for the hard manganese wire being 16,800 kilogrammes per square millimeter, while the soft wire had a lower modulus. The modulus for ordinary steel wire is 18,810, and for iron wire 18,610 kilogrammes per square millimeter.—*Engineering*.

AMERICAN MACHINERY IN EUROPE.—The ingenuity of American inventors is making itself felt in the manufacturing districts of Europe, and it is expected that the coming American exhibition in London will more materially impress this upon all those engaged in mechanical industries. There is a peculiar pleasure in noting the growing favor which is being accorded to the clever devices that originate in this country, in the old manufacturing provinces on the other side of the Atlantic. We hear much about the superiority of European machinery over that made in America, but however true this may be in certain particulars, it is equally clear that in contrivances which contribute toward increasing the productive capacity of a machine, by accelerating the speed and facilitating its operations, Yankee ingenuity has no equal in the world. The machine-shops of England find profitable employment in turning to practical account many of the inventions that had their creation in this country and found their first record on the books of the patent office at Washington. In one of our

recent English exchanges the existence of this state of affairs was especially brought into notice by elaborate references to several important American inventions, one of which, but little known outside of cotton mills, was the gravity spindle for the cotton ring frame, which has come into general use in English manufactories.

Choosing Material for Gaskets.

The choice of a material for gaskets cannot be too carefully made. The material should be yielding, elastic, tough, and these qualities should not be very much affected by the temperature of steam at ordinary pressures. It should be yielding, because this property enables it to adapt itself to any trifling inequalities of the seat or surface of the plate, thereby insuring a tight joint with a minimum of trouble. It should be elastic, to enable the gasket to accommodate itself to slightly different sizes and shapes of man-holes of the same nominal size. It should be tough and strong, as this is most important to prevent serious accident, and if it is affected by slightly by a temperature of, say 350 degrees Fahrenheit, a gasket may, if care be exercised, be used repeatedly, which is quite an important item when there are several boilers and the water is so bad as to necessitate frequent opening for cleaning purposes. Such gaskets can be procured without much trouble, but to tell the truth, those lacking most, if not all, of the above desirable qualities are much more readily obtained. We have before us, as we write, a portion of a gasket which came very near causing serious trouble, a short time since. Owing to its weak and incompressible nature a portion of one of the man-hole gaskets blew out, and the shock was so great when it let go that all the seams of the shell were so sprung that it was necessary to calk them, and the tubes were loosened so that they had to be rolled before the boiler could be used again. The boiler was an excellent one, or the probability is that it would have been ruptured and an explosion would have resulted from the shock. It is very likely that many explosions have resulted from this cause alone.

Standard Screw Threads.

The late Sir Joseph Whitworth was the first to inaugurate a system of standard screw threads. The form of thread and the number of threads per inch which he recommended were based partly on the results of numerous experiments and partly on the average obtained by comparing the various forms of screwed bolts then in use. The Whitworth system has been very generally adopted in all parts of the civilized world except the United States. The Sellers system, introduced here in 1864, has the same number of threads per inch, but the form of the thread is different.

Hydraulic Steel.

The last work of Mr. Whitworth was the production of his hydraulic steel. He hailed the advent of the Bessemer steel process with ardor, but found its defects in the blow-holes in the metal. He devised a press by which he subjected the molten metal to a pressure of six tons to the square inch, thus doing away with blow-holes and increasing its strength immensely. One of his presses was called the 8000-ton press. The results were extraordinary. The shafts of many steamers were made of this metal, those of the City of Rome and the Inflexible among others. In 1877 he applied it to armor plate. In 1868 he founded 30 £100 scholarships, which, by his advice, counsel and donations of exhibitions to competitors, he fostered personally throughout his active days. They were designed to train young men in technical work, which he recognized as one of the needs of England. His horonety, which expired with him, he received in 1869.

ERIE'S GREAT INDUSTRY.—It is not generally known that Erie, Pa., produces more engines and boilers than any one city in the United States. There are nine foundries and machine-shops, the largest manufacturers of engines being the Erie City Iron Works, the Stearns Manufacturing Co., the Skinner Engine Co., the Nagle Works and the Ball Engine Co. The capacity of the nine shops is 10 engines a day, or about 3000 a year. Nearly all the shops make a specialty of sawmill engines—very heavy and especially adapted to the extraordinary strain the sawmill engine is subjected to, at one time doing its utmost and at the next instant idle.

TO TEST KEROSENE OIL.—Manufacturers of kerosene oil say that all lamps are safe with good oil, and that the quality of oil can be ascertained by the following test: Take a pint tin cup, fill it nearly full of water warmed so that an ordinary thermometer immersed in it will show 120°, pour a small quantity of oil on the water, stir it a little, then pass a lighted match quickly but closely over the surface of the oil once; if it ignites, the oil is unsafe. If purchase are made of from 3 to 5 gallons at a time and this test is made, people can protect themselves.

THE WIRE NAIL TRADE is rushing into prominence as a consumer of wire and wire rope. It was recently stated on good authority that in 1886 the output of iron nails was 600,000 kegs, against 400,000 in 1885, and that it is expected that fully 1,000,000 kegs will be reached in 1887.

SCIENTIFIC PROGRESS.

Chemical Action in the Soil.

The chemical action which plant food undergoes in the soil to prepare it for assimilation by the plant is given by a correspondent of the *German Town Telegraph* substantially as follows: The active cause of the chemical action of the acids and alkalis in the soil seems to be totally misunderstood or entirely unknown by most writers upon the subject. Water in moderate quantity, or more properly *moisture*, is the prime requisite. Heat, or more properly *warmth*, is perhaps equally important. Neither of these alone will cause the needed reaction, or, if any does take place, it will be too feeble to be of any value to plant growth. When, however, the two are present in suitable proportions, every invigorating quality in the soil becomes at once active—destructive fermentation commences, the general fertilizing properties are broken down, mixed together and reduced to that condition in which only they can become really plant food.

Plants cannot absorb dry substances, neither can they absorb wet substances if too wet. They must have their food mixed in perfect proportion to be able to grow well. If their food is too dry, the roots die outright; if it is too wet they must gorge themselves to obtain enough real nourishment. In the first case they dry up; in the last one the circulation is all water, which is *no food*, then they die. The talk about gases in the soil is all hosh. Plant food is neither wind nor water; it is a pabulum or pap, consisting of the especial article—humus—slightly diluted with water, merely as a lubricator to enable it to flow through the plant's circulating passages, and become eliminated on its passage. Put a handful of dry meal into one's mouth. What is the first call? Water, of course; not a flood, but just enough to moisten it.

THE WAVE OF COMPRESSION.—When a pile is struck on the top, what is known as a wave of compression passes through it, says *Engineering*; and this wave requires time for its passage. Such a wave is set up in all columns when stress is suddenly brought on one end. Thus, for example, if the muzzle of a fowling-piece containing a column of air is plugged up with a cork, or with snow or mud, the barrel may be hurst when the weapon is fired, simply because, while the pressure at the muzzle is yet too small to move the cork, the pressure at the breech end is great enough to burst the barrel. The wave of compression will not reach the muzzle till the breech has been hurst. In the same way the detonation of a lump of dynamite on a rail will break it, the action being so sudden that the wave of transmission of pressure has not time to pass through the air surrounding the dynamite, and the air really plays almost the same part as a block of steel round the explosive. The effect of a heavy ram falling a short distance on a pile head resembles a push, in a sense, and gives time for the transmission of the effort throughout the whole pile, but when a light monkey falls, the effect may be confined to the top of the pile, which is shattered. In order to make this quite clear, we must take into account the element time, concerning which we have said nothing yet.

SCIENTIFIC REWARDS.—The prizes which have been bestowed by the French Academy of Sciences form a long list, one of the most important of them having been that given a few years ago to Prof. Ball for his work in connection with the telephone. Those offered for 1887 include 100,000 francs for the discovery of an efficient remedy for Asiatic cholera; 10,000 each for the best works of physics, chemistry and physiology; 7500 francs for work on general embryology; 3000 francs for researches on the phosphorescence of animals; 3000 francs for a comparative study of the hearing apparatus in mammals and birds; 3000 francs for a comparative study of the fresh-water animal life of Africa, South Asia and Australasia; 2500 francs for an improvement of the steam engine, or other invention contributing most to the progress of steam navigation; 2000 francs for any valuable therapeutical discovery; 2500 francs for work on the distribution of heat over the globe's surface; 500 for a theoretical and practical study of progress in aerial navigation since 1880; besides many others, ranging from a set of Laplace's works to 10,000 francs, for specified work in mathematics, astronomy, chemistry, botany, medicine, mechanics, and other sciences, and in aid of scientific students. Papers are to be handed in before June 1.

INFLAMMABLE BREATH.—There is a brief reference in a recent number of *Science* to a remarkable case in which the breath of an individual, or rather the eructations of his stomach, took fire when brought in contact with a lighted match. This case, which was reported in the *Medical Record*, has called forth communications from physicians by which it would appear that the phenomenon is not such a rare one as was at first supposed. In one case of disordered digestion the patient emitted inflammable gas from the mouth, which, upon analysis, was found to be largely composed of marsh gas. In another case the gas was sulphuretted hydrogen. A case is reported in the *British Medical Journal*, in which, while blowing out a match, the patient's breath caught fire with a noise like the report of a pistol, which was loud

enough to awaken his wife. One evening, while a confirmed dyspeptic was lighting his pipe, an eructation of gas from his stomach occurred, and the ignited gas burned his mustache and lips. In Ewald's book on indigestion, the analysis of the gas in one of these cases was: carbonic acid, 20.57; carhuretted hydrogen, 10.75; hydrogen, 20.57; oxygen, 6.72; nitrogen, 41.38; sulphuretted hydrogen, a trace. The origin of these gases is undoubtedly the undigested food, which in these cases undergoes decomposition.

DO BIRDS FLY DOWN?—This query has recently been made a subject of some considerable discussion among scientists and observers. Mr. C. F. Holder writes as follows in *St. Nicholas*: I see, in a back number of *St. Nicholas*, that one of your correspondents appeals partly to me in regard to birds flying down. But all who have written seem so well posted that I doubt if I can add anything to their knowledge. However, I have seen a California quail, a wood-dove, and a humming-bird flying downward; but in slow flyers, with large wings and heavy bodies, the wings are used more or less as parachutes in going down; in other words, the birds spread their wings, and rely upon gravity. This I have noticed in the sandhill cranes in their migrations along the Sierra Madres. A flock, of say a hundred, will mount upward in a beautiful spiral, flashing in the sunlight, all the while uttering loud, discordant notes, until they attain an altitude of nearly a mile above sea level. Then they form in regular lines, and soar away at an angle that in five miles, or so, will bring them within 1000 feet of the earth. Then they will stop and begin the spiral upward movement again until a high elevation is reached, when, away they go again, sliding downhill in the air, toward their winter home. It is very evident that a vast amount of muscular exertion is saved in this way. In some of these slides that I have watched through a glass, birds would pass from three to four miles, I should judge, without flapping the wings.

LUMINOSITY OF THE OCEAN.—This proceeds from a great variety of marine organisms, some soft and gelatinous and some minute, shelly animals. They mostly shine when excited by a blow or by agitation of the water, as when a fish darts along, or oar dashes, or in the wake of a vessel when the water closes on its track. There are few subjects of study more interesting to passengers crossing the Atlantic than the luminous appearance thus presented by the sea. That water, the great extinguisher of fire, should be turned into flame; that the darkness of night should be illuminated by the luminous glow which bathes every ripple and breaks on every wave, or that lightning flashes should coruscate no less in the billows of the sea than in the clouds of the air, are facts which seize on the imagination. Nor is the interest lessened by the knowledge that all these phenomena are produced by animals whose home is in the great waters; that not only the fiery bodies of large animals give out steady patches of light, but that of the myriad animalculæ with which the sea teems, like motes in a sunbeam, each contributes its tiny scintillation, the aggregate forming a soft and lovely radiance.

PUMPING WATER UNDER PRESSURE.—The following theory as to the probable cause of the recent bursting of the Sheephead hay stand pipe, communicated to the *Scientific American*, is certainly a very reasonable one, and one which affords much food for thought in regard to the general practice of pumping water under pressure. The theory is given in the following words: "The actual cause of the bursting of said pipe, I believe to be the vibrations of the water inside of the pipe, caused by and from the action of the pumps, by which motion on the stroke or discharge of the pumps, the water in the tube would have to rise, and on the receding motion would drop back, which rising and falling motion would cause a greater strain on the pipe than if it had been full of water, said vibrations being kept up until there was gained a regular rising and falling motion of water in the pipe. Hence, also, the rumbling noise heard in the pipe, and the bursting force."

INFLUENCE OF ELECTRICITY ON DELICATE WEIGHING.—M. Hennig de Wurtzbourg having noticed some incomprehensible differences in the weights of equivalent quantities, undertook investigations, which showed that balances of precision are often influenced by the electric state of the glass case which surrounds them. This electricity influences the "riders" which slide on the beam of the balance. The error resulting from this influence may amount, it is said, to 600 milligrams when the case is strongly charged, and two hours afterward there may still be an error of 10 milligrams.

CURIOUS SCIENTIFIC FACTS.—The fact has been satisfactorily established, by various scientific researches, that many substances absorb luminous rays during the day, and at night emit these rays in such a manner as to impress photographic plates, although they may not be perceptible to the unaided eye. Artists have not only succeeded in photographing the visible night phosphorescence of Mont Blanc's summit, but have even secured an impression of a mid-night landscape—invisible to the eye—on the terrace of the observatory at Prague.

PROF. HUGHES says a silk ribbon is a better lightning conductor than a metallic rod.

ENGINEERING NOTES.

LOCOMOTIVE ENGINES.—What an easy thing it is to pilot a crowded ferry-boat across the bay and into her slip without a hump or a shock. If you don't believe it, says an exchange, try it! Also, what an easy thing it is to drive a locomotive. Pull a lever, and away she goes. Pull another, and she slacks up and stops. That's all, as most people look at it; but it is not all by any means. The quick eye, firm hand, and steady courage, the knowledge of every mile of the road, the sharp lookout for signals, the putting on steam upon up-grades and shutting it off on down-grades, the difference of expansion in the rails between hot and cold, wet and dry, and the ever-present feeling of responsibility for peril of life, limb and property—all these are matters unknown to the mass of the people who pay their fare, take their tickets, and get to their journey's end. Their lives, nevertheless, have all the while been in the hands of a rough, grimy-looking man in the engine-cab, whom, if they meet on the platform, they avoid lest they should soil their silks and broadcloth by the contact. These men should be, and often are, scientifically educated; but they have no very high social position, and their wages are quite inadequate to their responsibilities. The gentlemanly conductor, however, with his regulation uniform and well-displayed watch-guard, is a personage of consideration, the petted of passengers and respected by directors. The engineer is a mere "mechanic!" The world is full of irregularities and injustices.

THE THIRD ALPINE TUNNEL.—The attention of Paris is at present fixed on a scheme of competition with Germany by means of another Alpine tunnel through the Simplon, as a rival of the successful St. Gothard. The latter furnishes a short cut for German goods into Italy, and has seriously diminished French trade with the peninsula. It is estimated that the Simplon tunnel would shorten the time between Paris and Central and Southern Italy by three hours as compared with the St. Gothard line, and the gain over the Mont Cenis route would be still greater. The length of the tunnel would be about 12 miles, and the whole work could be done in from four to six years. It would be the longest tunnel in the world, and require extraordinary provisions for its suitable ventilation. This object could be attained, it is believed, by means of a horizontal air shaft above the crown of the tunnel and running its entire length, connecting by a series of vertical shafts with the atmosphere above the mountain. Pumping engines would not only keep the air constantly renewed, but would draw off the water which otherwise would steadily accumulate in the tunnel. Similar difficulties have been successfully overcome in other tunnels. The cost of this immense work is provisionally put at \$14,000,000 to \$16,000,000. If the Government should decline to be associated with the job, it is believed there would still be no trouble in procuring the money.

INCREASING THE SPEED OF VESSELS.—For 20 years L. P. Rider, of Pittsburgh, has been making experiments with the object of increasing the speed of vessels and lessening their draft by a change in the formation of the hull. At last he has constructed a boat with which he will make a test as soon as the river is free from ice. Engineers pronounce his theory a correct one. The boat, which is 36 feet long, is known as the "concave bottom," the hull being built in a right and left hand spiral form from the bow to the middle section. The conformation of the hull is such as to displace water in a manner closely approximating to the "wave line" theory, beginning at the cut-water. The displacement is accomplished gradually until the center of the boat is reached, when the reverse action of displacement begins. The concave begins where the convex ends. The greater speed the greater the lifting power, the boat rising on the water and consequently moving with greater speed without any increase of power.

A THREE-CYLINDER LOCOMOTIVE.—One of the latest innovations in locomotive building is a three-cylinder locomotive built by the Dunmore Iron and Steel Company for use in switching in its yards. It is thus described by the superintendent of the works: "This little engine has three 8x12-inch steam cylinders, four 33-inch driving wheels, two outside connecting and parallel rods, and one inside connecting rod. No balancing is needed in driving wheels. The engine has six exhausts to a revolution, and the effect on the fire is good. It is claimed that by setting the cranks at an angle of 120 degrees the slip is reduced to a minimum. This engine makes 30 miles an hour on a 40-foot grade easily, with a light load, and is considered a good machine by those who have run it. Its weight is about 12 tons."

RAILROAD EXTENSION TO UKIAH.—The surveys, plans and specifications for the extension of the Donahue road from Cloverdale to Ukiah are now completed, and work upon the same will be commenced as soon as the right of way can be properly secured. The work will involve a length of 4800 feet of tunneling, but the grade thereby will be unusually favorable. Arrangements to connect this road with the Southern Pacific from a point between Pacheco and Novera are also completed, and the work of extension will be commenced within 30 days.

GOOD HEALTH.

"Has Cancer Been Cured?"

In continuing the subject of cancer treatment as commenced in these columns in our last issue, we submit the following notes of some few cases which we think would well repay a thorough investigation by the medical faculty. The notes of these cases have been taken by competent medical authority from direct statements of the patients themselves, and practitioner and patients are anxious that a searching inquiry should be made by any medical practitioner so desiring. The true function of science has been, and ever will be, to collate facts, and to seek them with avidity from all sources, and, by careful study and digestion, deduce such general principles as may promote the welfare and power of the human race. The devotees of this spirit are scientific men; those who abnegate it can have but little share in the world's progress, and are practically pretenders and charlatans.

Mrs. Henderson, 1014 Powell street; age 45; three children; operated on June 28, 1885; then on Feb. 3, 1886, by Dr. Robert McLean; put herself under the treatment of a certain practitioner on April 12, 1886, as Dr. McLean had proposed to operate for the third time. Incision in left breast discharging, and the right breast becoming involved. Seven weeks under treatment. No return. Both breasts now healthy.

Mrs. Dr. M. E. Edmonds, 330 Sutter street; attended by Dr. Pease, Oct. 2, 1882; left breast, tumor egg size, very painful; he administered carbolic acid mixture internally. Dr. Fraser recommended operation. Dr. Max Werder said it was a malignant tumor. On December 22, 1882, placed herself under special treatment; first application relieved pain (many patients have so expressed themselves), and tumor gradually disappeared. Recollects having a blow, from a little boy, in this breast; says it was above the nipple; was unattached and movable. No return; breast healthy.

Mr. G. F. Willis, 634 Second street; age 65; noticed a small growth on lower eyelid six years ago, bleeding; grew to the size of top of little finger. Dr. Palmer (Mason and Taylor streets) wanted to operate, October, 1885. Three weeks under special treatment; tumor came completely out. No relatives have had cancer.

Mrs. Jennie Fonda, 124 Eddy street; age 40 years; married; three children. Ten years ago attended by Dr. Kenyon; ordered applications; said later on that it was cancerous and the breast should be removed; darting pains; lump was as large as her closed hand, and very hard. She then placed herself under special treatment; tumor gradually disappeared, and there has been no return.

E. Richards, 619 Montgomery street; age 55; no relatives that he can remember have had cancer; first noticed a small red pimple under left eye, eight years ago; began to grow larger three years ago; much pain; size of top of little finger; spread out and grew very fast. Dr. Stamboul said: "Richards, you must have that cut out; it's one of the cancer family. Dr. Murphy and myself will cut it out." He then sought out — on the recommendation of a friend whom he met at a restaurant; attended twice daily for 16 days—30 days in all; it "dropped out" on the sixteenth day, and has not troubled him since.

Mrs. Hannah Pleasant, 216 Twelfth street; age 41; four children, youngest four years. Tumor in left breast, not very hard; nipple retracted; only slight pain through nipple, size of large coffee-cup; growing quickly; first noticed eight months ago. Dr. McNutt wanted to "cut it out," Aug. 3, 1886. Dr. J. F. Moras said, "Cut both breasts out;" Dr. Whitwell, "Cut it out;" also Dr. Morley, Dr. Prince, Dr. Ward, Dr. Lane. Dr. Donnelly said, "Let it alone." Put herself under special treatment, Sept. 2, 1886; diminishing in size and softening.

Mrs. Williams, 413 Ivy avenue; age 44; four children, youngest five years. No cancer in family. Dr. Sweetland pronounced it uterine cancer, and proposed Dr. Hutchins; called in Dr. McNutt, who did not think her strong enough to stand an operation. Much pain, local and in back; discharge not foul; never had hemorrhages; menstruation regular. Placed herself under special treatment; glands becoming enlarged and tender. January, 1886, perfect recovery.

Mrs. M. H. Keane, 1006½ Washington street; age 50; four children, youngest 15. Nine years ago observed a small lump in right breast, slightly painful, size of hickory nut; saw Dr. Lane; he said it was cancer; that she could not live a year, and if operated on would have to be done again, as it was incurable. Dr. Toland also said it was cancer; proposed operation; Dr. Plummer and Dr. Ferrer same. Saw Dr. Lane again May, 1879, as it had grown to size of large coffee-cup; was very hard; adherent to breast-tissue, and glands swollen and tender; no break on skin. Two months under treatment; has perfectly disappeared; no return.

Mrs. Annie Cornow, 513 Eleventh street; age 43; four children, youngest 4 years. No cancer in family. First noticed in August, 1883; very painful at first, then got hard; saw Dr. Parker, Virginia City; used iodine; grew rapidly; "lanced it six times;" saw Dr. Lane on her return to the city; he proposed "to cut it off or scrape it;" axillary glands enlarged and pains radiating; the lancet-holes in breast discharging freely a watery, blood-stained fluid. Three

months under special treatment; no return; breast healthy, much scarred.

Mrs. A. J. Houghtaling, 1205 Taylor street; age 44; six children, two living; youngest, 2½ years. No cancer in family. May, 1886, first noticed tumor in left breast, painless; saw Dr. Clarke, Kearny street; proposed to operate; said it was cancer. Dr. Ayres, Washington street, proposed to "take the breast off;" grew to size of duck's egg; above nipple; nipple not retracted. June 1st sought special treatment; diseased mass came away entire, and left, cured, in August.

Mrs. A. Parker, 527 Grove street, S. F.; age 45; eight children, youngest, 5 years; grandfather on mother's side had cancer on nose; lived to be 82 years; uterine; pain local and in back, especially when tired; no discharge. Dr. Sweetland treated for ordinary ulceration or inflammation. Dr. Holdbrook, and afterward Dr. Hutchins, in 1881, pronounced it to be cancer, and amputated neck of uterus. Hemorrhages slight, but later on occurred at two weeks' interval for six months. Consulted Dr. Perrault, and six months afterward, applied for special treatment to the practitioner in question, who would not undertake the case. (Does not like to treat cases which have been operated upon or which have reached a late stage.) Went East for treatment; returned little better, and on April 16, 1883, applied again for special treatment and attended until August, 1883; cancer appeared on arm; it was healed also; large scar remains; no trouble since; looks very healthy and feels well.

Mrs. Amelia Cleverly, Alliance, Ohio; mother had cancer, from which at present she is free. In March, 1886, noticed a small, hard lump in left breast; shooting pains, not constant; went to Dr. Lane; said it was cancer; he could positively cure it by cutting it out. Dr. Fraser said it could be cured by cutting out. Dr. Roberts, Van Ness avenue, said it was cancer, and he could cure it by medicine alone. Applied for special treatment eight weeks ago last Wednesday; very hard and obstinate; would not absorb; was drawn out entire in four weeks; breast now healthy looking.

The above are but a few of the many other reports of supposed cures which are at our disposal, and which will be given in a future issue of this journal. In reply to several inquirers, we would remark that the name of the author of these apparent cures is, for proper reasons, withheld.

TALKING TO A DRUGGIST.—The Philadelphia Press very sensibly says: "Men who talk with or at a druggist when he is engaged at his business should in justice be held responsible for his errors caused by their impertinent intrusion upon his attention."

USEFUL INFORMATION.

Does Charring Timber Promote Durability?

The general belief has long been that it does, and in accordance with this conviction the practice has been widely followed. But a contrary view of the subject is taken by *Wood and Iron*. That journal says in a recent issue: "As charcoal would endure for ages in places where timber would decay speedily, the practice of charring the surface of fence-posts and other timber has been repeatedly recommended in books and ephemeral publications, as eminently worthy of universal adoption."

"The theory upon which such a recommendation is based would seem to warrant a confident expectation of satisfactory results in practice; but repeated experiments with charred timber have furnished conclusive assurance that the process will not promote its durability. Indeed, numerous experiments have shown that charring promotes premature decay. Two posts split from the same log may be set side by side in the ground, the surface of one being charred and the other not; and it will be seen that the charred post will perish before the other."

"The same is true of railroad ties and all such timber as may be exposed to the altering influences of wet and heat. Could the entire timber be changed from its perishable condition to one solid piece of charcoal, the durability would be promoted to a surprising length of time; but the strength of the material would be destroyed. When fence-posts or other sticks of timber are exposed to the rapid action of wet and heat, the surface will decay first. One might suppose, therefore, that when timber is enveloped by a layer of charcoal, the durability of the entire piece would be greatly promoted. And such would be the case were it not for the fact that the charcoal is not impervious to water; and as water reaches the timber below the charred surface, decay will commence soon after the grain of the wood has been exposed to the influences of the weather. When the change has once begun beneath the charred surface, the durable covering of coal will be of no service whatever in preserving any portion of the wood. Taking this practical view of the subject, it will be perceived that if only half an inch of the outside of a post be charred the post will not endure so long as if the same thickness of wood had been left uncharred to waste away by slower decay."

PAPER BOTTLES were patented in America in 1833. Their sale was not extensive at first, but now that European patents have been secured,

cured, covering nearly all fields of probable competition, the controllers of the patents, we are informed, intend to manufacture the bottles in large quantities. In the item of freight alone they will effect a saving of one-third less weight than glass or stoneware, and are, on the whole, less liable to breakage. Paper being also an excellent non-conductor, fluids stored in the air-tight paper bottles will withstand a more intense degree of heat or cold than they could endure without injury in bottles of any other material.

CEMENT FOR MENDING RUBBER AND LEATHER ARTICLES.—This composition may be used to repair the breaks in shoes or boots, and if used with care and intelligence, will prove a more expeditious way than sewing the rents or patches. The surfaces or edges to be brought together for cementing in this way should be pared or scraped, so that they will present a smooth joint or lap when cemented. Take one part of gum Para (which may be procured from dealers in rubber) and dissolve it in five or six parts of bisulphide of carbon (which may be obtained from manufacturing chemists at about 20 cents per pound or less). Then proceed as follows: Use a strong glass vessel that may be tightly corked or closed, and into this put enough of the small clippings or pieces cut from the gum, and upon this pour the given proportion of the bisulphide of carbon; then close the vessel tight. This solution is made without heat. The vessel should be taken up and shaken from time to time to facilitate the combination. The Para rubber is used instead of other kinds, as it is more flexible. Should the solution appear too thick, or become so in time, add a little more of the bisulphide of carbon. The solution must always be free from moisture. When this cement is made, keep it in tightly sealed jars.

TANNING TEXTILE FABRICS.—A Belgian inventor has devised a process for tanning textile fabrics which renders them waterproof and at the same time, it is said, proof against decay, while their suppleness is not diminished and their weight not appreciably increased. Arguing from the high state of preservation in which the bands which surround the heads of Egyptian mummies are found to this day, and which are impregnated with a kind of resin, the inventor had recourse to the substances extracted from birch bark and which are now used to perfume Russia leather. When the fine white bark of the birch tree is distilled it yields a light oil, nearly a fourth part of which consists of the special phenol, or carbolic acid, which gives the well-known odor to Russia leather. It is now found that the residue, or green tar, of the birch, which is obtained from Kostroma, yields neither acid nor alkaloid, and it forms, with alcohol, a solution of great fluidity, which, however, when once dried, is not acted upon by alcohol. It is this substance which will unite with the most brilliant colors that are used by the inventor for treating textile fabrics.

HOW THE GOVERNMENT CLEANS BRASS.—The government method prescribed for cleaning brass, and in use at all the United States arsenals, is claimed to be the best in the world. The plan is to make a mixture of one part common nitric acid and one-half part sulphuric acid in a stone jar, having also a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then removed into the water and finally rubbed with sawdust. This immediately changes them to a brilliant color. If the brass has become greasy, it is first dipped in a strong solution of potash and soda in warm water; this cuts the grease so that the acid has free power to act.

CLEANING SHOW WINDOWS.—A good cleaning powder for show windows, which leaves no dirt in the joints, is prepared by moistening calcined magnesia with pure benzine so that a mass is formed sufficiently moist to let a drop form when pressed. The mixture has to be preserved in glass bottles with ground stoppers, in order to retain the easily volatile benzine. A little of the mixture is placed on a wad of cotton and applied to the glass plate. It may also be used for cleaning mirrors.

THE EYES IN DEAD PERSONS.—A Frenchman has found means to restore the life-like expression to the eyes of dead persons. He places a few drops of glycerine and water in the corners of the eyes and the effect is said to be startling, so life-like do the eyes become.

By washing a pine floor with a solution of one pound of copperas in one gallon of strong lye, the appearance of oak flooring may be produced.

ONION ROOTS.—A correspondent of the *Rural New Yorker* found onion roots a foot long and still going down, though too fine to follow.

THE LARGEST COPPER PLATES ever rolled were recently turned out in Pittsburgh. They were circular in form and 176 inches in diameter.

THE GOVERNMENT CHEMIST of New Zealand has proven that the dust of the recent volcanic eruptions is of great value as a fertilizer.

FIFTY THOUSAND TONS of soot were taken from London chimneys last year. Its value was set at \$204,000—as a fertilizer.

EXPERIMENTS made indicate that the light of midday during fine weather penetrates the water of the sea 1300 feet.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MISCELLANEOUS.—The South Spring Hill Co. is about to put in an electric light for both mine and mill, and also at the underground stations. Nearly all the machinery is on the ground. This is the first company in the county to light by electricity.

COSMOPOLITAN.—The sale of a mine on Dry creek, near the Potosi and Hercules properties, and owned by W. Jennings and others, has been effected to ex-Governor Hale, of New Hampshire, and other Eastern capitalists. J. R. Tregloan will look after the property. The sale of the Mahoney mine at Sutter creek was not consummated. The surface rock upon which the mill is kept running to its full capacity is paying considerable over expenses. One half of the last cleanup went to the stockholders as profit. An effort is being made to form a company to operate the North Star mine, which lies south of the Talisman. Since J. F. Parks assumed the superintendency of the Kennedy, Sunday work underground has been abandoned, a change which the miners appreciate.

MAHONEY.—In addition to the surface work progressing at the Mahoney, preparations are being made to take the water out of the shaft, perhaps not below the 500-foot level, as it is claimed there is enough rock above that level to run the mill for years. The pumps were connected this week, and run for a short time to see that everything worked satisfactorily. Laying pipe at the Wildman is completed, and miners are now putting in a few set of timbers near the top of the shaft, after which the pumps will be placed, and the taking out of water inaugurated. A light pump will be put in temporarily, and as soon as the water is out of Knight's patent hydraulic pumps will be introduced.

SUTTER CREEK.—Cor. Amador *Dispatch*, March 5: Ned O'Neil continues to work his gravel claim, known as the Night Hawk, with fair success. Messrs. Botto and Watkins are working a small channel of gravel near the top of Sutter bill, which pays good wages. Occasionally nuggets are found which weigh from \$4 to \$5 apiece. The once famous Con. Amador mine will soon be a thing of the past, as far as looks are concerned. The mill and mine are nearly dismantled, everything having been sold or moved away, which causes disappointment to overcast the countenance of the people of Sutter Creek who, for many years, have gained a livelihood from it. The Iowa M. Co. is moving its large building and whim from the west shaft to the north one, during which time the mill will remain idle. The North Star and Washab mines have consolidated and will soon start up. Mr. Seabrook has just finished a contract of hauling 40 tons of sulphurets from the Kennedy mine to the Amador Reduction Works.

Calaveras.

RED ROCK.—San Andreas *Prospect*, March 5: Of late, B. K. Thorn has been prospecting on his old mine near town, and has discovered some rich rock not far from the old shaft and hoisting works. Free gold can be seen in the rock and it will assay from \$20 to \$80 per ton. Mr. Thorn has had Ruel Chase repairing the buildings on the mine and intends to run a drift to tap the vein at about 50 feet from the surface. A small mill will be erected and the lead prospected thoroughly. There is no doubt but the rock will pay from the surface. Ben has spent considerable money on this claim. The Leonard brothers commenced work on their mine near town last Tuesday morning. They intend to sink on the vein and develop the mine as fast as possible.

El Dorado.

GARFIELD.—Placerville *Observer*, March 8: The Garfield mine is situated about one mile from Greenwood, and is the extension of the famous Cedarburg mine. This mine is now under the superintendency of T. G. Bilty, of San Francisco, who is at present engaged in thoroughly prospecting the mine. Three tunnels have been run, the main one now being in a distance of 675 feet, and is tapped by an air shaft from the surface. Mr. Bilty is now taking out some very good ore, but says he has not yet reached the main body of the ledge. The ore now being taken out is of low grade, but is good average milling ore. He expects to have the tunnel completed within the next 60 days and through to the main body of ore, when he says we may look out for startling developments.

TEXAS HILL.—Cor. *Mountain Democrat*, March 6: The storm closed down the mill at the Texas Hill mine for want of water, and we miss the clatter of the stamps. There is plenty of water now for ground sluicing, though the water is not yet in the big ditch. Mr. Parker is ground sluicing, and others are busy in this vicinity.

HENRY'S DIGGINGS.—Fine weather has come after the storm, and the miners who have been huddled together here are scattering for their homes and claims at Pi Pi, Brownsville, Dogtown, Mendon and Fairplay. The mines of Henry's Diggings are all lying idle, owing to the deep snow, but the Mt. Pleasant is running day and night.

Fresno.

MINERS ENOUGH.—Fine Gold *Miner*, March 4: As a friend of the laboring men we advise them not to come to Hildreth until other mining companies start developing mines, the town at present being full of idle miners. The following is the present extent of the different companies' pay-roll: McNally Co., 75 miners; Hildreth Co., 20 miners; James & Francis Co., 18 miners; White Rock Co., 25 miners; Mountain View Co., 12 miners; Quartz Mountain Co., 20 miners; Texas Flat Co., 60 miners; Zebra Co., 50 miners; McKenzie & Rule Co., 15 miners; scattering throughout the section upon different prospects, about 300 miners, and plenty of applicants on hand.

HILDRETH NEWS.—The owners of the Cascade mine have discovered a three-foot ledge in running a cut about 250 feet above their tunnel. The ledge is undoubtedly a feeder to the main ledge and assays \$30 per ton. The vein in the working shaft, the extension through the tunnel and the newly discovered croppings, develop the ledge 250 feet in depth by 100 feet in length. The ore in the tunnel is rich in sulphurets and mills \$45 per ton. F. Scully

and the Baker Bros. are the owners. The owners of the Morning Star have started sinking in the working shaft upon a two-foot ledge of quartz that mills \$30 per ton coarse gold and contains very good sulphurets which assay \$200 per ton. The gold in this vicinity averages \$16.40 per ounce. The owners have quite a large dump of ore that assays as stated, and the mine is regarded as a good property. The Rough and Ready prospect is considered the mine of the future in Fresno district at the present time. This property adjoins the Morning Star, and is most favorably situated for working the ledge to an advantage. As far as the ledge is concerned, this whole mineral belt contains as fine a milling quality of ore as can be found in any mineral district. The Rough and Ready ore is very rich in sulphurets, and taking an average sample of the ledge from the surface, from wall to wall, and the entire depth of the incline (100 feet) also in the intermediate drift (25 feet), the ore will mill \$40 per ton. The Taylor and Fraser mine is looking exceedingly well; the ledge in the working shaft improves as depth is attained. At present the size of the ledge, including clay selvage and other prospecting matter between the walls, is 5½ feet, containing a 2½-foot ledge of quartz of good milling quality. The owners are erecting houses for the men, and have just completed a fine wagon-road leading to the mine. The Promontory, owned by James Ryan, Hanlan, and the Baker Bros., shows up a well-defined and continuous ledge in their tunnel, thoroughly mixed with loose quartz, being in talc and clay and four feet wide between walls, the hanging-wall being in the sedimentary formation, while the foot-wall is composed of soft granite that resembles alabaster. Ledge samples of 20 pounds of ore average 25 cents to the pan or \$70 a ton, fine and coarse gold being mixed; not being below water-level, the owners have not struck many sulphurets. This property adjoins the Taylor and Fraser mine. The Hildreth mine was visited last Thursday by John McNally, of the Abbey mine, and to Mac's surprise the mine has improved 90 per cent in size of the ledge and development since last summer, under the management of Wm. M. Laverone. The superintendent of the James and Francis mine, Mr. A. McFadyen, stated that he expects, from the present indications, that the ledge would widen out from 9 feet to 12 feet between walls. The 9 feet of ore that was opened up last week in character and formation is entirely foreign to the district, being decomposed quartz containing one-half green talc mixed with a little soapstone, the high color, no doubt, being caused partly from the decomposed sulphurets. For the last 10 days nothing but ore has been hoisted. The company will sink the shaft 150 feet and then crosscut the pay chute, with drifts east and west to ascertain the width of the pay chute. The Wilson mine and property is another James and Francis mine in every respect, and from location and situation, although a mile apart, are undoubtedly on the same ledge. The ore of the Wilson is just as rich and about the same character of formation, and at present, at a depth of 85 feet of incline, the ledge between walls is two feet.

Inyo.

ORE SHIPMENT.—*Register*, March 5: S. A. Densmore made another carload shipment of ore from his San Carlos property, week before last. This was the second shipment for February, with a third one to be made still. The fact that but two men are employed speaks well for the mine.

LOOKOUT MINES.—*Independent*, March 5: Very good reports of mining interests come from Lookout. The late snowstorms have blocked the roads so that teams cannot haul ore to Keeler. At the Modock mine 35 tons are sacked ready for shipment and about 66 tons more are packed to the furnace. At the end of December, a prospect drift was started from tunnel No. 3; on Monday, a week ago, this drift broke into a chamber of high-grade silver and lead ore; at date of report this body had been cut into a distance of 13 feet with no sign of a wall and very little waste in the ore. This is the most favorable looking prospect seen in the district since 1876. The furnace is prevented from starting up only for want of coal; it will not be possible for teams to reach the coal for three weeks yet. At the Fitz mine three men are taking out ore; at the Kentucky mine three men, and at the Modock mine seven men are at work. In each of these mines several more miners could be employed, but there are no idle men at the camp. Smith & Wallace are working the Minnetta mine with five men; they are taking out very rich ore, all of which will be shipped away as soon as roads are open.

Placer.

MAY FLOWER AND LIVE OAK.—*Placer Herald*, March 5: F. Chappellet, superintendent of the May Flower and Live Oak drift mines, near Forest Hill, was in Auburn last Monday. The May Flower is a mine the reputation of which is established. The channel is extensive and rich, and it only remains to run the necessary tunnel to afford drainage and a cheap and convenient method of working, to put the May Flower in a position which will entitle it to rank among the best drift mines in the State. The work of running this tunnel, begun some months ago, as we learn from Mr. Chappellet, is progressing vigorously. At a distance of 495 feet from the mouth of the tunnel a shaft has been sunk 326 feet deep to the tunnel grade, and from the bottom of this shaft the tunnel is being run in both directions, in addition to the work that is proceeding from the mouth, thus driving three faces at one and the same time and enabling the company to run about 500 feet a month instead of about 200 feet a month, as was the case before the shaft was completed. At the top of the shaft are engines for running the hoisting works, the pumps, and machinery for driving fresh air into the works. At present, or up to the last report, the tunnel was in 1850 feet from the mouth, 65 feet west from the shaft, and 60 feet east from the shaft, making in all 1975 feet completed; and leaving about 3000 feet yet to run. With good luck, the channel, already thoroughly prospected by Mr. Chappellet, will be tapped before another fall, and when it is, one of the richest and most extensive mines in the State will be opened for systematic and regular working. As to the Live Oak, Mr. Chappellet thinks it is sure to prove a big mine. The prospect tunnel from Brushy canyon was run most of the way through gravel, but a few weeks ago, when in a distance of 1400 feet, they struck the main channel, which is developing richer and larger than anticipated. Thus far the gravel has averaged about \$3.60 to the ton, and a cut 176

feet crosswise of the channel has not yet reached the rim. In this mine the channel is separate and distinct from the May Flower channel, though the two run parallel and not far apart. The difference is noted in the character of the gravel and the character of the gold. The proof, now considered established, of two distinct channels so close together on the same divide, only goes to show the vast extent of the auriferous deposits of that section, and indicate the importance of the district as a gold-producer, when these channels shall become, by different companies, more thoroughly opened, or, in other words, opened in different places along their course.

Nevada.

PROSPECTING AT MEADOW LAKE.—*Transcript*, March 5: It is stated that as soon as spring opens the company which was last fall experimenting in Meadow Lake district with the electric process of amalgamating, will resume operations with increased vigor. The milling facilities will be enlarged by 20 stamps and other necessary machinery will be added. It is said by those who ought to be informed that the experiments last year were much more successful than was generally believed by the public, the policy of the operators being to make as little stir as possible until they had obtained certain properties there.

THE DRIFT GRAVEL MINES.—*Foothill Tidings*, March 5: The drift gravel mines above here have good lots of gold-bearing gravel on their dumps, and we expect to hear good news from them when they clean up. Just now they cannot wash their gravel because of snow and ice in their ditches. It is reported that the Planet mine dump is showing well and gold is visible to the naked eye on the bedrock. The East New York, Swamp Angel, Enterprise and Golden Bull mines, all drifters in the Planet neighborhood, have rich dumps that are waiting the moving of the waters. The North Star mill is almost ready to start up. It is the finest and most conveniently arranged gold quartz mill in the world.

NEW PROCESS FOR WORKING SANDS.—*Tidings*, March 2: Messrs. Gould & Cobb, late arrivals here, have contracted with the Idaho Mining Co. for the right to "work" the tailings from the Idaho mill. These gentlemen have a new patented process, by which it is claimed that the sand from a mill, after passing through the best concentrators known, can be worked at a profit. A large shed is being erected on Wolf creek, just below the mill and near the railroad crossing, in which the operations will be conducted. Crocker & Richardson are constructing some peculiar boxes to be used in this work.

Plumas.

GENESEE VALLEY.—Cor. *Greenville Bulletin*, March 5: Mining and prospecting are active in this vicinity, while milling is at a standstill, owing to the cold weather of the past week, which froze up the arastras on Ward creek. As old Sol is asserting himself, however, it will be but a short time before the turning out of bullion will again be the order of the day.

Trinity.

QUARTZ.—*Journal*, March 5: From C. C. Shattuck, who was in town this week, we gather the following in regard to his quartz investments in Hay Fork: The Huntington mill recently erected by him has not been running for some time, as the roads have been too soft to haul ore from the mine to the mill. At present he is running a tunnel to tap the vein in the Magdalene at a depth of 300 feet, and, by this means, to ascertain something as to the permanency and value of his property. It is a good working tunnel six feet in height by six feet in width, and was begun from the side of the mountain opposite the ledge. Three shifts are working night and day and much good work is being done. Tunnels are also being run in on the Cyclone and Horse-shoe mines, in both of which Mr. Shattuck is interested. As soon as the roads will admit, the mill will be started to crushing again. The quartz looks well and prospects better, and Mr. S. expresses himself as thoroughly well satisfied with the outlook for his mines, and expects in the spring to add bis quota to the bullion produced in the county.

Shasta.

SILVER BRICKS.—*Shasta Co. Democrat*, March 2: Last Saturday the Iron Mountain Mining Co. sent to Redding to be shipped by Wells, Fargo & Co. to the Argo Smelting Works in Colorado, 15 silver bricks of base bullion, weighing a little less than 1200 pounds, value \$3600. This bullion is the result of the reduction of 110 tons of low-grade ore—which shows that this class of ore averages about \$35 a ton. With their present plant, which is only an experimental one, they are able to work only eight tons a day. The experiment so far has been most satisfactory and will impel the company to put up much larger works this summer. This is signal success, and solid proof of the value of this mine is most gratifying to the mining fraternity generally, and is the forerunner of extensive mining achievements to be made on the Iron Mountain belt. It will also have its effect at Copper City, where there is an unknown quantity of good ore that ought to be reduced by the same process that has proven a success at Iron Mountain.

NOTES.—The Texas and Georgia mine has shut down, owing to the disagreement among the owners. It is rumored that Riley & Co. have been offered \$100,000 for the Central mine recently purchased of Bell, Hopping & Co. It is rumored that Mr. Riley is after the Old Spanish mine in the Old Diggings, owned by Fife & Harrison. Mr. Riley has purchased 250 tons of ore belonging to Bell, Hopping & Co. from the Central mine, paying therefor \$10 per ton. Out of 1600 pounds of rock from the Central mine, Mr. Chick got a little button of \$40. It is claimed that the ore was below the average value. We hear that the Little Maud mine near Iron Mountain, owned by Dow & Haskell, is developing well. Their tunnel is in about 125 feet, with quite bright prospects. Some time back 13 tons of sulphurets yielded \$12 to the ton, while two tons sent to San Francisco gave \$40 to the ton. O. P. Boyd is in charge of the works, and a thorough test is to be made.

OLD DIGGINGS.—*Redding Free Press*, March 5: We paid a visit to the Texas and Georgia mine in the Old Diggings district last week. The Calumet mill is located on the Sacramento, nearly opposite Spring creek. The mill had shut down for Sunday, and we had no opportunity to see the machinery in motion, but obtained a general idea of how the gold is extracted by the Paul patent mill. This mill is capable of crushing 24 tons of rock a day, and the

daily consumption of wood by the furnace is three cords. Several buildings for the use of the men are located near the mill, and the general appearance of the works indicates good management. Getting back to the main road, we soon passed the mill of the Central mine which was in full operation. This mill is also located on the bank of the river. About one o'clock we arrived at our destination. Mr. Day was on hand, and furnishing us with a guide, we climbed the mountain and investigated the mine. We found a succession of seven tunnels from the base of the mountain clear to the top. These tunnels are about 90 feet apart and from 30 to 90 feet long, and most of them show an ore body. The center tunnel is the longest and presents a fine body of ore eight feet across; in fact, it fills the face of the tunnel. This section contains many fine locations, and the natural facilities for working are good. The Texas and Georgia is on a line directly north from Mr. Miller's Gem mine, and the altitude is about 800 or 900 feet above sea level.

Tuolumne.

WILLETTA.—*Tuolumne Independent*, March 5: The stamps are running lively at the Willetta mine, near Jacksonville. Sixty tons of ore are being reduced daily, but it is of low grade, and Superintendent Wagoner proposes to batter up the rock, and move the finer stuff to the mill by water, rejecting the coarse material. There is abundance of water and pressure for the purpose. Work is progressing at the Maryette mine, at Tuttle town. At a depth of 220 feet the vein shows a width of seven feet and the rock shows splendidly.

NEVADA.

Washoe District.

JUSTICE.—*Enterprise*, March 5: From the drift going south on the 350 level, from four to five tons of ore are being extracted daily. This drift is following a streak of ore which was at first only an inch or two in width, which has now expanded to a width of from four to five feet. The ore assays run as high as \$30 to \$40 a ton, and the ore extracted will mill about \$20 a ton. There are now on the dump about 150 tons of this ore, which will presently be sent to the mills. The ore streak improves in going south, and the face of the drift is still some 300 feet from the south line of the mine. A drift has been started south, to find and follow this ore streak, from the bottom of a winze sunk 60 feet below the 350 level.

SAVAGE.—An increased daily output will be forwarded to the mill henceforward. On the 800 level, west crosscut No. 3 has been advanced 19 feet, its total length being now 156 feet. On this and the 600 levels the miners have been partly occupied in easing the drift timbers. The south compartment of the company's shaft has been repaired and is in fine working order to the 800 level.

GOULD AND CURRY.—On the 425 level the southeast drift from the main south drift is still progressing in low-grade quartz. The upraise on this level is in vein material giving low assays. The west crosscut from the upraise on the 300 level is cutting occasional bunches of milling ore. Repairs to the main shaft between the 1000 and 1100 levels are advancing to completion.

CROWN POINT.—Owing to the breaking of the turbine wheel at the Santiago mill, on the Carson river, where the ore was being crushed, no work is now being done in the ore-producing sections of the mine. The wheel is being repaired at the Carson foundry, and will be in order again in three or four days. The extraction of ore will then be resumed with a full force of miners.

POTOSI.—The drift south from the Chollar line on the 250 level is now out 350 feet. The face is in vein material. A number of drifts in the mine are filled with ore that cannot now be milled for lack of milling facilities. As soon as the weather becomes settled the erection of a mill at a point a short distance below the mine will be commenced.

CON. CALIFORNIA AND VIRGINIA.—West crosscut No. 1 on the 1300 level is out 460 feet. On the 1400 west crosscut, No. 3 is out 285 feet. The drifts east and west from No. 2 winze on the 1435 level show a width of over 90 feet of ore. Ore is still being stoped from the bottom of the north winze on the 1500 level.

OPHIR.—The usual progress has been made in east crosscut No. 1, on the 1065 level, without change of material worthy of note. East crosscut No. 1 on the 1300 level is out 344 feet, and the northwest 78 feet. The material encountered in these drifts is a mixture of quartz, clay and porphyry of a favorable appearance.

YELLOW JACKET.—The usual shipments of ore have been made to the Brunswick mill during the week. The greater part of this ore, amounting to over 1100 tons, came from stopes above the 1300. Extensive explorations are being made at several points above the 1300, between the sagebrush and 900 levels, where there is a considerable amount of virgin ground.

IOWA.—The tunnel in the face is in vein matter giving low assays. The south drift from this tunnel is showing a nice stratum of gold-bearing quartz in the roof and face. The surface vein discovered a few days ago has been cut across, showing a width of 12 feet, and giving good assays in gold.

ALPHA AND EXCHEQUER.—These mines are being explored jointly. On the 120 level a west crosscut is being run in vein material which lies in the Alpha ground. A drift north from the old Alpha shaft is penetrating some promising vein material in the Exchequer.

SILVER STAR.—This mine, situated to the west of Silver City, in Devil's Gate district, is being developed under the supervision of Dr. Webber, of this city. In it drifts are being run north and south along the vein on the first or 100 level in very favorable ground.

MEXICAN AND UNION.—The north drift on the 1300 level, which is being run jointly with the Union, is now out 530 feet. It is now in Mexican ground a distance of about 280 feet. The joint Mexican and Ophir east crosscut on this level is now out 210 feet.

OCCIDENTAL.—From 12 to 14 tons of ore are being extracted weekly. The usual progress has been made in the several drifts from the upper and lower tunnels, and in those that are being driven from winzes sunk from the two tunnels.

BEST AND BELCHER.—West crosscut No. 2 on

the 600 level is out a little over 280 feet in a soft formation consisting principally of porphyry. The northeast drift on the 1500 level is out nearly 700 feet in a favorable vein formation.

CHOLLAR.—Repairs to the shaft are progressing favorably. Pending these but little work is being done in the way of exploring the various levels where it is expected that ore will be found.

OVERMAN.—Six carloads a day of fair ore are being taken out from the level in the old Petaluma-street tunnel. This is shipped to the Vivian mill, for reduction.

ALTA.—Still pushing the south drift from the bottom of the winze on the 800 level. The drift is in promising material lying near the wall of the vein.

UTAH.—The north drift on the 472 level is making fair progress and is now out a little over 200 feet. It still shows streaks of quartz.

SIERRA NEVADA.—South lateral drift No. 2 on the 520 level is now out a little over 350 feet. It is passing into vein material that yields low assays.

BALTIMORE.—Good headway is making in the work of reopening the old 225 and 450 levels and in cutting out the new station at the 550 level.

BELCHER.—No work is being done at present in the ore stopes for reasons which will be found under the heading of Crown Point.

SUCCOR.—Retimbering the main shaft, preparatory to vigorous prospecting operations at depth.

BULLION.—Low-grade quartz is still met with in the drift east on the 200 level.

IMPERIAL.—Repairs on the surface and to the shaft are making good headway.

Pioche District.

THE CAMP.—Pioche Record, March 2: Since our last issue the mining outlook for the camp has neither changed for better nor worse. There are two shifts, of two men each, working underground in the old Raymond and Ely, besides two engineers on top; total, six men. The fleaching works are again in operation, running on screenings from No. 3, old Meadow Valley, and also the Burke mine. Mr. W. S. Godbe arrived from Salt Lake a day or two since, and we learn that he is confident of raising \$200,000 for the purpose of prospecting and developing the camp.

Sweetwater District.

BEING DEVELOPED.—Emerald News, March 5: The mines in this district are being developed, and as work progresses the showing for good greatly increases. This district is now attracting the attention of Eastern capitalists, also the Walker Bros., of Salt Lake City. John Sheehan has some valuable mines at Clinton. New York parties are negotiating for their purchase. Judge Curran is employed as watchman at the Kilpatrick mill. It is expected that this mill will be enlarged for the purpose of crushing ore from some of the outside claims of the district. Henry Williams & Co. have let a contract to extend the tunnel run, to cut the ledge on the Thoroughbred mine, which is now in 175 feet; they have 25 feet further to run, when they expect to cut the ledge at a depth of 400 feet. The ledge is very large and contains fine-milling gold ore, averaging from \$20 to \$35 per ton.

Tucacora District.

BELLE ISLE.—Times-Review, March 5: Line crosscut, 150-foot level, extended 7 feet; total length, 86 feet. The rock is very hard, and it is difficult to make any headway. North drift at this point has been advanced 12 feet. Will resume work on the 250-foot level as soon as the track is relaid and other repairs are completed.

NORTH BELLE ISLE.—The rock has become quite hard in the gangway north, from the south end line, 400-foot level, but it still breaks well, and fair progress has been made the past week. There is no improvement in any of the workings.

NAVAJO.—There is no material change in the workings on the 350-foot level. The ore that is being extracted from above the 150-foot level is very low grade, and if it does not improve in a few feet, will stop stoping.

NEVADA QUEEN.—The station at the 200-foot level has been cut out and timbered; shaft is being timbered in the place of the cribbing, which was eroding in. West crosscut, 350-foot level, has been advanced 22 feet; distance from turn-table 95 feet. It has been dry; a slight seepage is showing in the face. North gangway on this level has been stopped until connection with the shaft has been made.

ARIZONA.

SAMPLER.—Prescott Courier, March 4: Mr. Cockburn informs us that he will shortly commence the erection of a house 45x45, near the railroad depot, for the ore-sampling works. The plant will consist of Cornish rollers, Blake crushers, pulverizing mill, assay furnaces, etc., all to cost from \$10,000 to \$20,000.

MORE GOLD.—Mr. J. O. Floyd, of Turkey creek district, was in the city yesterday. He brought golden news. Two miners have been interviewing a ledge in Turkey creek district, about 25 miles south of Prescott. Others had prospected the same ledge and found nothing very rich, but the latest prospectors have discovered a large vein of gold-bearing rock that will pay \$100 to \$500 a ton. This is certain. Mr. Floyd thinks it is the best thing he has seen in the mountains.

COLORADO.

SEVEN-THIRTY MINE.—Georgetown Courier, March 3: The developments in the Seven-Thirty mine are constantly opening up new ore bodies and prove the continuous richness of the veins in all directions. Thirteen headings are being driven, one winze sunk, two raises and one crosscut made. For some time past three separate veins were worked in the lower levels west of the main shaft. These were heading northwest and each produced ore of high grade. More recently the south vein, which has been very productive where worked in the upper levels, has been opened by crosscuts from the 80-foot and 240-foot levels, and practically adds another rich mine to this already rich grist. The crosscut on the 240-foot level is 27 feet long through hard granite, and only reached the vein last week, disclosing in it a nice body of ore. A similar crosscut will now be commenced on the 275-foot level, which will tap the vein at a depth of 500 feet below the surface. The

value of this newly opened vein may be estimated from a shipment made from it a few days ago, which contained 1867 ozs. silver and 1686 lbs. lead, and assayed 124 ozs., 195 ozs., and 460 ozs. silver to the ton, according to class. Thus it will be seen that four distinct veins are being worked in the western ground of this mine, each one heading in a different direction, and each one very profitable. Only one of these was known to be valuable on the surface. This fact should give confidence to our miners in following small leaders of ore which depart from the main vein, or in crosscutting from a vein already followed to others which may be known or believed to exist on either side. It is likely that in this way new veins may be opened up in many of our mines which have already been extensively worked and great value added to them. The Seven-Thirty mine has been worked for 15 years, yet the vein in it which is now producing such rich ore has only been recently known to exist in the lower workings.

IDAHO.

LARGE LEDGE.—Owyhee Avalanche, March 5: We understand that the lower tunnel run to strike the Wilson lode at Wagontown, cut a large ledge, which prospects well. The ore is gold-bearing, and from what we can learn it is the best yet found in that lode. Everybody is looking forward to good times here during the coming summer. Old mines will be worked for what they are worth, new ones will be discovered, and all the mills in the camp will be rattling away on ore from War Eagle, Florida and Wagontown.

OREGON.

LARGE SALE EXPECTED.—Bedrock Democrat, March 2: Upon reliable authority we can say that negotiations are now pending for the sale of the large body of placer claims on Chicken and Connor creeks, owned principally by Weatherby, Moore & Campbell on the part of the Chicken Creek mines, and Campbell, Near & Sisley, of the Connor Creek properties. Chicago people are to be the purchasers, and the consideration \$110,000. The sale, in all probability, will take place as soon as the expected purchasers arrive here, which will be as soon as they are notified of the opening up of spring. At this season of the year it would not be practicable to visit this section in the interest of mining operations, for the reason that it would be impossible to properly examine the properties in question on account of the deep snows completely retarding locomotion in the mountains. The mines in question are very valuable and extensive, and during many years past have yielded thousands upon thousands of dollars of the "shining metal," and yet it can be truly said, they are just beginning to be opened up. Acres of ground still remains untouched by the pick and shovel, and to all indications is richer than the ground already worked.

PINE CREEK.—Bedrock Democrat, March 2: The Colorado Mining Co., of Pine creek, has succeeded in negotiating for 16 mining properties for the sum of \$185,000, and has shipped 200 tons of freight and machinery from Denver via Baker City. The machinery for the Whitman mine, near Baker City, consists of a 20-stamp mill, 200-horse power engine, eight Frue vanners, sawmill outfit, wire-rope tramway, incandescent electric light, and complete sampling machinery. The entire plant is expected to be in operation by the 1st of July next. The population of Cornucopia, the site of the Pine creek mines, is something over 200. The snow there is over ten feet deep, preventing locomotion outside of the town, and almost completely suspending mining operations, except on the properties of some of the leading companies, who were prepared for a hard winter.

NEW MEXICO.

SHIPMENTS.—Socorro Bulletin, March 6: Heavy shipments of mineral are reaching the Graphic smelter. Rev. J. M. Robinson has resumed work on his Iron Mask mine of Garcia canyon. A. R. Bryson is shipping ore from his Magdalena claim, the Quartz Lode, to Socorro. M. Donney, the Apache district miner, had a large quantity of his high-grade ore treated in Socorro this week, and more coming. John A. Miller left on Friday's stage for Alma. He went up to start up the Peacock mill and will give it his personal supervision this summer. W. Trimble, who is working the Juanita by contract, is in the city. He is having some of the high-grade ore recently intersected in that property, sampled at the Billing Works. He reports the Juanita much improved. Capt. J. P. Casey returned from Las Cruces on Tuesday. He reports the Orgao districts as experiencing a mining revival. R. N. Graham of the Gutierrez mine is working that property. A. Donan and Bob Huston are sinking in the Sharon. Marriner's Modoc shaft continues to gain depth steadily. Mr. Graham reports an improved condition of mining throughout the Pueblo district. As we go to press, a strike is reported made by the natives two days ago, west of San Pedro, in this county. The mineral is sulphide of iron, carrying by determination 18 in gold and \$2.60 in silver. The gangue is quartz and the vein measures 28 inches in width. The walls are limestone and syenite. J. W. Howard, a colored prospector, has made the discovery of a five-foot vein of quartz which yields \$20 in gold and some silver. He made the find in the Lucera mountains, situated in this county. This range has as yet not attracted any attention from prospectors. Five hundred pounds of plumbago from a new discovery in this county were sent East for examination on Monday last. This graphite was very free from silica or other impurities, and is higher in carbon than any of that mineral yet discovered in the southwest. If the first shipment meets the approbation of eastern connoisseurs of the article, it will be followed by earload lots.

MONTANA.

ANACONDA.—Review, March 3: Superintendent Dawson came down from Butte Sunday morning with two engines and a large force of men, and came up on the branch to help clear the track. The weather in the meantime had turned into a sure-enough Chinook and the snow packed and settled considerably, so that the snow when once shoveled out would not drift back again. The work of shoveling was continued until the Anaconda train was clear

of the main track and the engines could be turned around, when a double-header with a small plow was turned loose, which soon cleared the track. The work of bringing in the delayed ore, coal and merchandise was commenced immediately, and by noon Monday 60 cars of ore had been brought in. The Chinook has done more for us than 10,000 men could do, and it has removed all fear as to having another blockade unless we have another fall of snow. The only thing to fear now is a washout, but we do not anticipate any great trouble on that account, as the snow will not go off too suddenly unless the nights should be much warmer than they are.

PROSPECTORS.—Anaconda Review, March 3: "It is an ill wind that blows no good to some one." This old saying has, without doubt, been proven by the past hard winter; while it has been the means of serious losses to the stock interests of Montana, it has been of benefit to the mining interest. The deep snow and cold weather has compelled the prospector to camp right where the cold weather overtook him, and not being able to hunt or follow up surface indications, he has mechanically worked ahead, in many instances hoping against his own judgment. This alone has been the means of developing three prospects in the immediate vicinity of Anaconda, which are now known to be mines of considerable value. One of these, the Boomerang, owned by Dresel & Carty, located just north of the Blue-eyed Nellie, has developed into a very valuable property. The fortunate owners have been developing all winter, and will be ready to ship their ore, which is very much the same grade as the Blue-eyed Nellie, as soon as the road will permit. There are three other claims in this immediate locality that are equally promising, and we are confident that early spring will witness one of the greatest mining booms ever known in this locality. An old miner stated to a representative of this paper that he believed the mining belt from Anaconda to Phillipsburg to be unsurpassed in the world. A new strike has been made in the Blue-eyed Nellie which is the richest ever found in that wonderful mine, and has increased the value at least three-fold. The owners are quite jubilant over their good fortune.

UTAH.

REVIEW.—Salt Lake Tribune, March 4: The week has been a dull one in mining circles; no special event has broken the monotony. The two-months' receipts of bullion for the year 1886 have been as follows: January, \$658,148.44; February, \$357,815.28; total, \$1,015,963.72. This excludes all receipts of ore. The Ontario output for the two months past was as follows: January, fine ounces, 104,446.49; ore sales, \$60,740.99; February, 96,328.29; ore sales, \$45,718.77; totals, fine ounces, 200,774.78; ore sales, \$106,459.76. From this the usual monthly dividends of \$75,000 each have been paid, or \$150,000 for the two months. The Daly product for the two months was as follows: January, fine ounces, 59,624.19; ore sales, \$17,518.61; February, fine ounces, 47,092.63; ore sales, \$4,505.63; totals, fine ounces, 106,716.82; ore sales, \$22,024.24. From this a dividend of \$75,000, or 50 cents a share, was paid the 15th of February. But no more dividends will be paid until the new machinery is all put in. The Daly (Marsac) mill was closed down for repairs from the 1st to the 7th of February, inclusive. The receipts in this city, for the week ending the 2d instant, inclusive, were \$96,358.04 in bullion and \$74,932.79 in ore, a total of \$171,290.83. For the previous week the receipts were \$130,868.41, of which \$100,620.74 was bullion, and \$30,247.67 was ore. The output of the Ontario for the week was 23,957.21 fine ounces, and ore sales to the value of \$10,834.10, a total of \$34,791.21. The Daly product for the week was 13 bars of bullion, 18,244.61 fine ounces; no ore sales. The receipts of fine bars for the week amounted to \$45,718.37; of base bullion, \$15,800. The Hanauer smelter produced bullion to the value of \$14,045, and matte valued at \$5,400, a total of \$19,445. The Horn Silver has had a bad week on paper. At the mine, very limited operations are going on under a thick veil of secrecy.

PARK NOTES.—Record, March 2: The Anchor is now well supplied with all the requisite machinery for developing that more than promising property for some time to come. Sinking is still going ahead as rapidly as possible with the usual large force. With the excellent pumping facilities the water in the mine is well controlled. The Boss property, under the management of E. P. Perry, is attaining good results. It is understood that daily dividends will not be resumed until after the new machinery gets into working order.

THE CRESCENT PREPARATIONS.—Among other companies making ready for new machinery, the Crescent's preliminaries are most noticeable. By next May, the winze will have been far enough down and other preliminaries ready to receive and put in operation the following machinery, which embraces one of the largest plants ever produced in Utah, aggregating in weight more than 100 tons, viz.: One No. 10 Burleigh air compressor, one pair 100-horse power double-drum hoisting engines, one pair of 54x10 steel boilers, two 48x6 air receivers, a No. 7 Lowell filter-heater and condenser, 1200 feet of wire rope, 2200 feet seven-inch air pipe, etc. After this plant gets in working order, the mine can be advantageously worked and the high-grade ore economically extracted. Large shipments of first-class ore and regular dividends will surely follow.

CAMP CROSSCUTS.—Before long Mr. Pierson will have the mammoth Pennsylvania incorporation on foot and working on the valuable ground of Pioneer ridge. There is little room for doubt that the directors of the Park Mining Company, which owns the valuable, paying group of claims at the head of Thayne's canyon, will order operations to be resumed on a large scale as soon as the weather permits. This means heavy shipments of fine, high-grade ore, of which it is known they have a strong vein. Wm. Dix is making preparations to extensively work his coal property, which is located this side of Wanship, less than 12 miles from the Park. Thursday the Crescent concentrator was fired up to make a run on a sample lot of ore.

ORE AND BULLION SHIPMENTS.—For the 10 days just ended, the Crescent shipped 337,600 pounds of first-class ore. During the week, the MacIntosh sampler received 535,470 pounds of Ontario and 124,860 pounds of Daly ore; total, 660,330 pounds. Last Monday seven bars of Daly bullion, containing 7846 fine ounces of silver, were shipped from the Marsac mill.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DAWNEY & Co.'s Patent Office Library, 262 Market St., S. F.

FOR WEEK ENDING MARCH 1, 1887.

358,589.—WASHBOILER—G. Bergenheim, S. F.
358,597.—GRAPE AND APPLE CRUSHER—A. David, S. F.
358,608.—BALE TIE—A. S. Hallidie, S. F.
358,618.—HOSE PATCH—W. H. Loomis, Alameda, Cal.
358,686.—DREDGER—W. H. Milliken, S. F.
358,630.—HEADER—C. M. & W. L. Slayback, Folsom, Cal.
358,502.—ROOFING MATERIAL—G. W. Swan, S. F.
358,584.—SUBWAY FOR CABLE RAILROAD—Vogel & Whelan, S. F.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco.

PROCTOR WOOLEN CO. March 8. Location, Alameda Co. Directors—Geo. H. Proctor, J. F. Eastman, A. C. Henry, G. F. Crist and O. C. Kirk.

GUALALA M. CO. March 7. Location, Mendocino Co. Capital stock, \$100,000. Directors—J. W. Oates, John Field, R. H. Warfield, H. W. Barmham and J. C. Cox.

MEXICAN R. R. CO. March 8. Object, to construct a railroad from the City of Mexico through Cuernavaca to Puente de Ixtla, in the State of Morelos, a distance of 85 miles. Directors—Thos. Bell, Geo. Hearst, Louis Sloss, John Rosenfeldt, Louis A. Garnett, Henry S. Bacon and J. Augusto Verger. Capital stock, \$3,000,000 in 30,000 shares.

AERIAL STEAM NAVIGATION CO. March 9. Object, the manufacture of steam air-ships for navigating the air; has been organized, and filed articles of incorporation. Capital stock, \$100,000. Directors—J. N. Russell, A. T. Knorr, M. M. Patterson, C. M. Seeley and Robert Brown.

OREGON CASKET CO. March 9. Object, manufacturing coffins, caskets, hearses, and all necessary paraphernalia for the conducting of funerals. Capital stock, \$50,000. Directors—James P. Pierce, John P. Finley, William P. Morgan, C. H. Morgan and George P. Thurston.

WHITNEY STANDARD AND OAKLAND TRANSFER CO. March 9. Object, to do a general express, transfer, and agency and commission business in the State of California. Capital stock, \$100,000 in 2000 shares. Directors—M. A. Cahn, A. J. McGovern, Oscar Fitch, A. M. Babbitt, A. M. Salinger, R. S. Farrelly and M. J. Miller.

Mining Share Market.

Mining stocks have been rather active this week. The fact that assessments are rather plentiful just now does not seem to affect the market much. Notwithstanding the fact that last month was a short one, and that the freezing of the Carsoo river reduced the amount of ore milled about 20 per cent, the Consolidated California and Virginia shipped \$270,592 in bullion. The milling facilities of the Comstock mines will be all right shortly, and there will then be a larger output of ore. In a few weeks the whole line of the Comstock, from the Utah to below Silver City, will be more active. A new mill is to be built in Virginia, below the line of the Comstock, where will be worked the ore developed on the Potosi.

Most of the mines dealt in at the stock boards show cash on hand on the 1st of the month, very few showing an indebtedness.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Granite Mountain, March 4, \$67,715; Hanauer, 1, \$4025; Bannock, 1, \$1800; Richmond Con., 3, \$18,884; Silver Reef District (for February), \$18,772; Hanauer, 3, \$8900; Alice, 3, \$20,800; Moulton, 3, \$11,114; Alice, 5, \$10,702; Hanauer, 5, \$8374; Bluebird, 4, \$35,568; Hanauer, 6, \$2690; Con. California and Virginia, 8, \$75,271; total from this mine for February, \$270,592. Wells, Fargo & Co., of Salt Lake, received in bullion last week \$98,425; McCornick & Co., \$51,755; T. R. Jones & Co., \$7525, and Union bank, \$13,594.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall carefully demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

H. P. GREGORY & CO.

Cor. Fremont and Mission Sts., - - - San Francisco, Cal.

This cut represents our
**IMPROVED
HYDRAULIC
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

SHIPPING AND COMMISSION MERCHANTS,

309 and 311 Sansome Street, San Francisco, Cal.

Agents for Growers and Manufacturers. Charterers of Vessels for all Trades. Agents for the Mexican Phosphate and Sulphur Company's Products. General Insurance Agents.

Have correspondents in all the chief cities of the United States, Europe, Australia, India, China and the principal islands of the Pacific. Purchase goods and sell California products in those countries.

General Agents for the Pacific Coast of NATIONAL ASSURANCE CO., of Ireland; ATLAS ASSURANCE CO., of London; BOYLSTON INSURANCE CO., of Boston, Mass.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

PATENT

LIFE-SAVING RESPIRATOREntirely Prevents Lead Poisoning
and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belt, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vortical Turbines for Wooden Penstocks and in Iron Globs Cases, free of cost, by applying to the manufacturers.

New York Metal Market.

Telegraphic advices dated March 9th give the following New York prices:
 BAR SILVER—\$1.01 1/2 per oz.
 BORAX—\$1.06 1/2.
 COPPER-LAKE—\$1.04 1/2.
 IRON—No. 1, \$22.00@22.50.
 LEAD—\$4.75.
 QUICKSILVER—\$3.50@4.
 The following is the latest by mail from the "New York Metal Exchange Market Report":
 COPPER—Dull, spot closing at \$10.60@—, Transferable Notices (Lake) issued at \$10.75@—, Transferable Notices (Chili Bars) issued at \$39.10@. 6d.
 LEAD—Steady at \$4.33@4.50 spot. Transferable Notices issued at \$4.45.
 TIN—Firm at \$22.60@22.75. Transferable notices issued at \$22.65.
 Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Aus-

ASSESSMENT NOTICE.

The Phelps Manufacturing Company.—Location of principal place of business, San Francisco, California. Location of works, San Francisco, Cal.
 NOTICE is hereby given, that at a meeting of the Board of Trustees, held on the 12th day of February, 1887, an assessment (No. 1) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 17 Drumm street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 21st day of March, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 5th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
 W. H. PHELPS, Secretary.
 OFFICE—17 Drumm St., San Francisco, Cal.

ASSESSMENT NOTICE.

Gover Improvement Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, California.
 NOTICE is hereby given, that at a meeting of the Board of Directors, held on 28th day of February, 1887, an assessment (No. 2) of ten dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 318 Pine street, room 6, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 26th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
 R. N. VAN BRUNT, Secretary.
 OFFICE—318 Pine St., San Francisco, Cal.

"CHALLENGE" Ore-Feeders

Patented March 17, 1874; December 28, 1880;
 July 21, 1885.

Over 1600 of these Machines have been put in practical use, giving perfect satisfaction.

It has long since been fully demonstrated that the principle upon which a thoroughly practical Ore-Feeder must be constructed is that of a CARREER, and not that of a percussion shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky, spasmodic or roller contrivances will not answer the purpose for wet, sticky ores.
 These Ore-Feeders are adopted by all of the most prominent Quartz Mills in the United States, and we have shipped a large number to the best Mills in the Mining Districts of Mexico, Australia and South America. In this connection we deem it proper to call attention to the fact that a form of Feeder known as the "Templeton Roller" Feeder is being manufactured in this city, and as the manufacturers of the same claim that they are superior to any other style, and cite those in operation at the "Bunker Hill" Mill in Amador county, we contradict the statement, and in substantiation submit copies of letters, which speak for themselves:

BUNKER HILL GOLD MINING CO.,
 AMADOR CITY, CAL., July 12, 1886.
 To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: We have used the "Challenge" and "Roller" or "Templeton" Ore-Feeders in our mill for the past three years, and I am free to say that I consider the "Challenge" far superior to the "Roller" Feeder, in that most important of all things in a quartz mill, namely, the regular feeding of ores to the batteries. If the "Roller" Feeder is regulated to feed finely pulverized ore, the coarser ore will choke the outlet of the battery, and no ore can reach the batteries. If, on the other hand, it is regulated to feed coarse ore, then the fine ore when it comes will sluice right through and fill the batteries. The "Roller" Feeder requires constant attention. Yours truly,
 (Signed) N. W. CROCKER, Supt.

SAN FRANCISCO, Jan. 3, 1887.
 To Joshua Hendy Machine Works, No. 51 Fremont St., S. F.—GENTLEMEN: In reply to yours concerning "Roller" or "Templeton" Ore-Feeders, built by the Golden State and Miners' Iron Works, of this city, for more than a year past, in the Bollo Gopher Mill, in El Dorado county, this State, and being acquainted with the superior principles of construction and the operations of the "Challenge" Feeder built by yourselves, I unhesitatingly indorse the statements made by Mr. N. W. Crocker, Superintendent of the "Bunker Hill" Gold Mining Company, under date of July 12, 1886, as to the irregularity of the feed of the "Roller" or "Templeton" Feeders under the conditions of use which he names, and I am very truly yours,
 (Signed) W. G. ROBERTS,
 Of Greenwood, El Dorado Co., Cal.
 TAYLOR MINE, NEAR GREENWOOD,
 EL DORADO CO., Jan. 17, 1887.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco—GENTLEMEN: In reply to yours concerning Ore-Feeders I have to say that the "Challenge" is the best in use. I have placed the following in mills of this county, viz: Four in the Pacific Mill at Placerville, two in a mill at Pleasant Valley, two in the Texas Mill to feed gravel, two in the Water Co's Mill, and they all gave good satisfaction. I have also placed the following "Roller" or "Templeton" Feeders, viz: Four in the Bollo Gopher Mill, near Greenwood; one in the Boulder Mill, on Weber Creek, and the proprietors of those mills have complained of their not working well. I intend putting two "Challenge" Feeders in the Taylor Mill right away. Yours truly,
 (Signed) D. C. WICKHAM.
 OFFICE OF THE
 SOUTH SPRING HILL GOLD MINING CO.,
 AMADOR CITY, CAL., Feb. 3, 1887.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco—GENTLEMEN: Having used four (4) of the "Challenge" Ore-Feeders in the Mill of the above-named company, under my supervision, during the last year, and having frequently seen and carefully observed the operation of the "Roller" Feeders in the Mill of the "Bunker Hill" Gold Mining Company, I can, and do will, indorse the statement made by the Superintendent of that company, bearing date July 12, 1886, as to the comparative merits of the two forms of "Challenge" and "Roller" Feeders, and I am pleased to be able to state, from my long practical experience, that the "Challenge" is the most economical, durable and best form of Feeder yet devised, and I would not use, nor would I advise the use of the "Roller" Feeders under any circumstances at whatever price they might be quoted.
 Two "Challenge" Feeders were originally placed in the Ten (10) Stamp Gold Mill of the "South Spring Hill" Gold Mining Company, and their operation was so completely satisfactory that when the mill was increased to its present capacity of Thirty (30) Stamps four (4) more were added and the six (6) are giving perfect satisfaction. It affords me pleasure to bear this testimony to the excellence of the "Challenge" Feeders, and I am, very truly yours,
 (Signed) J. R. TRELOAR,
 Superintendent South Spring Hill Gold Mining Co.

We are prepared to furnish either the
 "Challenge," "Stanford," "Tullock," or
 "Roller" Feeders,
 And will furnish descriptive Catalogues and quote prices upon application to
JOSHUA HENDY MACHINE WORKS,
 89 to 51 Fremont St., San Francisco.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
 In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Our New Street No. 220.

Upon first occupying our present location on Market street, we found our premises numbered 252, and the next door east of us (toward the water front) is numbered 218. This discrepancy of numbers has confused people coming up to our office from the ferry-landing. One-fourth of a block above us on Market street, appear the numbers 400 and upward, there being no numbers used from Nos. 300 to 400. Parties coming down the street and seeing the numbers 400 and upward, knowing our number to be 252, have naturally concluded that they had a block or two to walk before reaching our place, and have frequently passed by our office to suddenly find themselves abreast of numbers 200 and odd, and have to retrace their steps. Much confusion has occurred in this manner. For this reason we have adopted No. 220 [Market street], hoping in a measure to avoid the difficulty, and trusting that some day the city authorities will take the matter in hand, and see that Market street, in our locality, is properly numbered.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

\$1,000 CHALLENGE ACCEPTED,

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS
(\$550.00).**

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insure their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

San Francisco, Cal.

1850. 1885.
RANKIN, BRAYTON & CO.,
...BUILDERS OF...
MINING MACHINERY.

San Francisco: Chicago: New York:
127 First Street. 100 N. Clinton. 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH of the YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all the AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft and is CAPABLE OF CARRYING 500 feet of five eighths steel rope. SEND FOR CIRCULAR.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearing, cog or pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

The Hazelton Boiler.

While the developments, as applied to the application and use of steam in the various departments of engineering, have in the last half century been marvelous, it must be admitted that but little advance has been made in the matter of its generation. Better material and workmanship have given increased service and security, but the old form of tubular boiler has always stood as about the best type for reliable and reasonably economic service.

Many different forms of sectional and multi-tubular boilers have of late claimed the attention of steam-users, on the ground of safety and economy, and while having some advantages in these respects, they are more than counterbalanced by their complication, involving a degree of care and attention that makes their use impracticable in the majority of instances.

The Hazelton boiler, illustrated on this page, is now attracting much attention in all parts of the country, and is believed by those most familiar with the subject to be the most marked improvement ever made in this direction, and to embrace the best principles ever combined in any form of a steam generator. The general design of the boiler is such a radical departure from all other styles heretofore used that it at once challenges attention, and to those who may not be familiar with the extent to which it has already been introduced and the length of time which in some instances it has been in operation, it might be regarded as somewhat of an experiment.

The evidence submitted, however, in regard to its practicability and success is most conclusive. It may be here stated that there are now upward of 100 of them—aggregating some 13,000-horse power, operating in the Eastern States—in many instances subjected to the severest tests, conclusively demonstrating their practicability and the possession of the highest merits.

There are certain distinctive features of the Hazelton boiler which must commend it to all users of steam, among which may be mentioned the fact that it requires less floor space and weighs less per horse-power than any other. It is claimed to be economical to the last degree, having a larger amount of heating surface in proportion to weight and area than is possible in other form of construction. It produces dry steam; the circulation of the water is so perfect that but little scale will form upon any part of the boiler; complete combustion, with natural draft; facility for using the lowest grade of fuel, such as shavings, sawdust, tanbark or any other combustible material. It does not prime even with salt water. Very little radiation of heat from the outer shell.

The illustration being a sectional one, a more detailed description may be necessary to enable our readers to get an intelligent idea of its construction. It consists of a vertical central column with horizontal tubes radiating from it at all points, the holes in front of the column representing the openings into which the tubes are set to complete the circle; the size of the columns as well as the number, length, and size of the tubes determining the capacity; two-thirds of the height of the column represents the water space, and the remainder the steam. The part of the column below the grate-bars forms the mud-drum, into which all the sediment is precipitated and removed through a blow-off pipe. The mud-drum is

SECTIONAL VIEW OF HAZELTON BOILER.

provided with a manhole, which affords access to all the interior parts, so that every tube can be got at to scrape out or repair, should this be necessary. The tubes are welded up at the outer end and subjected to a pressure of 600 pounds to the square inch. They are then expanded into the column with the ordinary tool used for this purpose. The tubes are set stag-

gered, so that the flame impinges directly upon all. The grate-bars extend entirely around the vertical center column. The boiler is fired through two or more doors, depending upon size and location. At the top of the jacket is an iron cone-shaped hood, with iron smoke-stack, which can be run up either straight or connected with a brickstack, as desired.

The cut on page 189 shows the boiler with brick setting complete. The Pacific Iron Works, of this city, are sole manufacturers for the Pacific Coast. A representative of the PRESS visited the California Cotton Mills at East Oakland last week, where they have a 150-horse power Hazelton boiler at work. It is doing excellent and exceptional work. Another one of 200 horse power is now being built for the Spring Valley Water Co., and there are several orders on hand for other boilers for various parties.

Mines Around Sierra City.

In conversation with Mr. G. T. Fletcher, of Sierra City, this week, we learn that mining affairs in that part of Sierra county are quite lively. The Sierra Buttes, Young America, and Phoenix mines are all paying well. The latter has been bonded for \$30,000. The Young America is temporarily shut down for lack of water. At the Sierra Buttes they have between 300 and 400 men at work, and the Young America gives work to some 300 when running. The reason of their temporary stoppage is because the wood gave out, and they had to stop pumping water from the lake. The Phoenix has all the machinery ready for the big mill, but the storm prevented their getting it in this winter. They have built a flume about four miles long, two feet deep and three feet wide, to bring water in from the Yuba river. The flume was not quite completed when the stormy weather stopped further work. The snow was deeper than had ever been experienced, there being five feet eight inches in Sierra City and about four feet in Downieville. It was eight feet deep on the Summit between Sierra City and the valley.

On his trip down Mr. Fletcher states that they had to put snowshoes on the horses for some distance. These horse snowshoes are ten inches wide, one foot long, and have the corners rounded off. They are made of gum belting. The horses soon get used to them. At first they are awkward with them on, but soon learn to step wide, and then get on all right.

The outlook around Sierra City is very good. At Gold Valley they expect to spend \$200,000 on the Empire mine. The company which bought it is putting up chlorination works and will erect a big mill. Part of the machinery went in last fall. It is an old mine, with rebellious ore, which could not be worked. Mr. Fletcher states that they now have some process which has been used in Arizona with success, and which will admit of their working this ore at a profit. Several mines have been discovered at Gold Lake, and on one a mill will be put up this spring.

In Sierra valley this winter the thermometer has gone down as far as 16 degrees below zero; at Sierra City the lowest was 10 degrees above. Sierra City has about 1500 inhabitants, and more are coming in. Some 30 new residences will be put up this spring, and there are now no vacant houses. The Sierra Buttes, Young America and Phoenix mines will employ directly about 1000 men. Then all the mine supplies, coal, timber, spiling, etc., are furnished by others, so that some 1500 to 2000 men are kept at work on wages by these mines. There is some little litigation about water rights between the Sierra Buttes and Young America mines, but aside from this everything in that region is going on prosperously and smoothly.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Mexican Mines.

The Gold Veins in Sonora.

EDITORS PRESS:—In looking over some of your former issues—one of October 9th especially—I notice you refer to the Hebrews in Egypt, who, having no straw, could supply no building material, etc. I propose furnishing you the straw from the mines of this region, although a foreign country. What I tell you shall be strictly true, you to furnish the mud, as agreed. Of course this is not different from other mining countries. We have very many very poor mines—non-paying. About one out of every hundred may pay to work; yet at this rate we have good mines, some of them very rich. I call a mine that will furnish plenty of \$100 ore a rich mine, and it is, in any country. We have some here that will go up to the above, and many that will go to \$60, \$80, etc. I own a mine eight miles north of this city—the Virginia. It has nine feet of ore that will average \$38 per ton in silver and 58% of lead. It can be easily worked. There are good roads from the depot of the Sonora railroad to the mouth of the mine. I call this a fair mine. The shaft is down 85 feet, is 6x8 feet, inclines about 80° northeast. Water is five miles away, except what can be obtained from wells. Wood is plentiful, but there is no timber, and none is required. At the station of Torres, two leagues north of the station, I own the Kansas City mine, the ore of which is very base indeed. The vein is five feet in width, and will average \$80 per ton. All the assays I have had return \$130 per ton; but I wish to be on the safe side. It is black sulphurets full of the pyrites of iron, antimony, etc., with some lead, but not much. The shaft is 140 feet deep, 8x10. The walls, both hanging and foot, are solid. No timber is necessary. Wood and well-water are abundant. One may trace this ledge for 10 miles on the surface. There are good roads to the station.

I own a gold mine 10 miles above Bacuache, evidently the mother vein that supplies the rich placers below it, and which every one has heard of, for they are old and noted in history. This shaft is 100 feet deep, 5x7; vein 7 feet wide so far as seen, although the hanging-wall is much shattered, and not in very good condition. The vein or pay streak is full five feet in width, and will run from \$40 to \$200 per ton. A bold, never-failing spring gushes out of the mountain just by the vein. Fine pine timber is abundant. The road is fair until the last league is reached, when there is a good trail for packing. This trail begins at the foot of mountain. I call this a big thing for some party who is able to work it, which can now be done comfortably and safely. Formerly the Apache Indians held these parts. It was their stronghold. I am also owner of the San Juan mine at Carbonaro. It is a large vein between walls, but the pay streak is only 2½ feet, which will work to \$100 per ton. The shaft is 100 feet deep, 8x10. The road is fair.

All the mines in this vicinity are paying mines, and worked by Messrs. Tooker & Hardwick, who are shipping ores constantly to the line, to the smelters in the United States. There are many such mines here as I have above described, which are not being worked, for they belong to very poor men for the most part, and many of them are denounceable to any person who may wish them. A smelter here in Hermosillo would be the thing for these miners, the ores being rather too low grade to pay to ship, while they would pay very well to haul the ores 5 to 20 miles. In a radius of 25 miles I can name about 50 mines, none lower grade than I have mentioned, and some of them higher.

I own a group of three gold mines within a radius of half a mile of each other. The veins will average six to eight feet in width. The ore average, per assay, \$100 to \$300 per ton. This is big talk, but perfectly true. A small spring of pure water at the mines is invaluable. There is plenty of tall pine all over the mountains, with good roads from Tombstone to the foot of the mountains.

All the country is excellent for stock-raising, especially about Bacuache, for it is well watered. The Yaqui River country is now open for settlers, and it is a fine rich country. Many orange trees are being sent over there to set out on ranches. All this country could be easily cultivated by a small outlay of money and a little effort. Artesian wells could be made, and an abundance of water obtained anywhere, I think, at from 25 to 100 feet deep.

PAUL GREGORY, M. D.

Hermosillo, Sonora, Mexico.

Treatment of Black Sand.

EDITORS PRESS:—Referring to the article under the above heading, in your issue of Feb. 26th, permit me to suggest a trial of the sulphur process in the fire assay of the material discussed. I think the method would give satisfactory results as to gold. The dressing would be about as follows:

Ore.....1 part
Soda.....3 parts
Borax.....1 part
Litharge.....1½ parts
Some flour or charcoal, and enough of sulphur

to convert all of the metal present into sulphide, including the lead of the litharge; mix; cover with salt and heat to low redness in a clay, sand or black-lead pot for some time; then introduce some metallic iron in the form of large nails or thick wire, and raise the heat gradually to very bright redness for 20 to 30 minutes or more, according to the quantity of ore treated. Remove the nails, after washing off any adhering lead in the slag, and either pour the assay into a mold, or cool and break the pot. Cupel the lead button, etc., as usual. If platinum is present the parting process must be modified accordingly.

C. H. AARON.

Academy of Sciences.

President Harkness occupied the chair at the meeting of the Academy of Sciences, on Monday evening. Dr. F. V. Hopkins was elected a resident member and Dr. Carl von Hoffman was proposed for membership. Specimens of tin ore and of tin from the Black Hills were presented to the museum by Melville Attwood; also piece of petrified wood from Mount Ranier, by R. S. Floyd.

The librarian reported that since the last meeting the contributions to the library had numbered 57, including pamphlets on "Volcanic Action," "Dissecting a Mountain Volcano," "West Coast Botany," "Quicksilver Statistics," "A Catalogue of Known Plants," "Meteorology of the City of Oakland," and many others of an interesting character.

Dr. Behr read an interesting paper by Dr. Mrs. Mary Curran on "Lichens of the Vicinity."

Dr. C. C. Parry also read a paper on the "Pacific Coast Alders." He said that California might justly be proud of her alders, which attain a greater size and are more frondaceous than those of any other country. Of the 14 species of alder known to botanists under the old-established genus *Alnus*—widely scattered over the world—four are enumerated in the botany of California. Of these, one is a high mountain shrub, common also to the Atlantic Coast. Another peculiar Pacific Coast species, the red alder, ranges from Alaska to Central California, five species of which may be seen in the vicinity of Berkeley. What is known as the common California white alder, is the ordinary species met with along the watercourses throughout the State, and has been included by botanists under two distinct species—*Alnus Ohlongifolia*, or the long-leaved alder, and *Alnus Rhombifolia*, or the round-leaved alder. For reasons given in this paper these two species are included in one, the latter, being the oldest name, having the priority. It is this species, varying in size in different parts of the country, which exhibits some of the largest trees belonging to the genus, not unfrequently obtaining a height of 80 feet, with a smooth columnar trunk, two or three feet in diameter at the base. One peculiarity of this species is its very early period of flowering, which, in the southern counties, commences in December and is completed by the middle of January.

In reply to a query by President Harkness, Dr. Parry said that the wood of this species was not particularly valuable. It made good charcoal and was used for some other purposes.

Wood River Ores.

It looks to us as if we would have to again look to Denver and Omaha for a market for our ores. When the annual contracts with the leading mines here expired by limitation, last December and January, and the Omaha and Denver smelters announced that they would not renew on the old basis, it was thought that, with the Interstate Commerce law in force, the nearer smelting works of Ketchum, Salt Lake, Portland, Reno, and San Francisco, would at once come into this market and eagerly avail themselves of the opportunity to secure our ores. But the reverse has been the case; for while the managers of the smelting works at the points above mentioned have all seemed anxious to buy our ores, as is evinced by their numerous letters of inquiry, none of them seem willing or able to give a basis of rates upon which a bargain could be concluded between buyer and seller, between the ore-producers and the agents of the smelters, although some are willing to close upon the very indefinite basis of a fraction below the "ruling" Omaha rates, which are subject to frequent change. It may be that this uncertainty is due to the ignorance in which all parties concerned seem to be in regard to the effect that the Interstate Commerce law will have upon rates to this point, and especially upon the rates upon bullion from the smelting works to the refineries. But, whatever the cause, the result is the same to us, and that is, that there are practically no buyers for our ores here at present.

If other buyers do not come soon, or, say, by the first of April, the date upon which the Interstate Commerce law will go into effect, our ore-producers will be compelled to ship to Denver or Omaha, as of yore, as better rates and quicker returns can thus be obtained than by selling elsewhere.—Wood River Times.

COLONEL J. J. TOBIN, the new Commissioner of the Bureau of Labor Statistics, has taken possession of his office.

Mining River-Beds.

A correspondent of the Tuolumne Independent writes as follows to that journal: Having had occasion to visit the Garibaldi quartz mine, on the Stanislaus river, near where a steam elevator is in operation taking up the gravel from the river channel, we will give a description of the machine and method of working. A boat, 40 feet in length and 20 feet in width, on which is placed the machinery for hoisting purposes and for washing the gravel as it is drawn from the bottom of the river, by means of a powerful fan-suction pump driven by a steam engine. A length of suction pipe, connected with the pump, is lowered down to the gravel, and when the pump is set working it draws the sand and gravel together with a large volume of water, which is discharged in sluice-boxes fixed to the deck of the boat, the discharge being continuous. Rocks weighing over eight pounds are taken up and discharged into the sluices by action of the pumps. Divers go down in submarine suits and clear away rocks too large to pass through the suction pipe, and to loosen up the gravel with picks and bars, when found too solid to be acted upon by force of the pump. The machine is floated from place to place as occasion requires, and is, in every particular of its mechanical construction and application, a success; but it is a question with us if it can be profitably used in working out the channel of the Stanislaus river. The question, however, of the practicability of the machine in working the river-bed remains for the future to disclose. Be it understood, then, that it is not by any means the aim of the writer to discourage any mining enterprise, much less this system, or any system by which sections of our rivers, not worked in the earlier history of river mining, may be profitably worked at all times of the year, except during extreme high stages of water. Unsubmerged bars, and bars uncovered during low stages of the river, where the richest gravels were deposited along its course, are practically exhausted in most parts; yet there is no doubt but there still remains much of the old diggings along the river-banks, which, by turning on a large volume of water and "booming," can be made to yield up large dividends to the toiler. We shall endeavor to keep informed on the progress made in this system of river mining, and wish the enterprise a success, whereby a new and more prosperous era may be brought about in this branch of mining industry.

Arizona's Gold and Silver Product.

The precious-metal yield of Arizona for the year just passed, considering the obstacles that had to be encountered through the cause of the Indian war, and the consequent lack of mining enterprise, according to statistics, exhibits a magnificent showing for the precious-metal production of our Territory. For the year 1886 the gold dust and bullion forwarded by express from the Territory was \$583,827, and the gold dust and bullion forwarded through other sources and conveyances was \$100,000. Of silver bullion expressed we find that \$1,371,083 were produced, and of ores and base bullion it is ascertained that the enormous amount of \$4,048,468 worth have been forwarded to the various smelting and reduction works throughout the country, outside of our Territory. The probable cause of this is explained through the superior means of railroad transportation, lack of faith or interests in our home smelting, reduction and milling works, and the scarcity of local reduction works nearer than the line of railroads. If this outgo could be in some way averted, it would add much prosperity not enjoyed now to our Territory. The remedy is local reduction works adjacent to mining centers. To say nothing of the unknown amount of ores and bullion taken from "mother earth" by her army of sons, chloriders, we find that Arizona's gold, silver, base bullion and ores known to have been produced during the year 1886, was \$6,103,378. All considered, this is a most magnificent mining exhibit. Our vast mineral resources are as yet only merely prospected, and there is not, perhaps, more than one or two mines in the Territory that an "educated miner" considers "opened." The possibilities of this country are of such magnitude that a man would not care to predict them for the fear of being called a "crank."—Arizona Enterprise.

LUCKY BUYERS OF INVENTIONS.—The life dream of a Lowell lady has been that the number 272,751 was to be her lucky number. Some years ago she invested a small amount of money in letters patent, bearing the favorite number 272,751. She claims the purchase was made to assist the inventor, who lost his health in the late war, rather than for her own speculation, notwithstanding her belief in the number. After years of patient waiting she has been assured by some of the best judges in the State that she had chosen a lucky number, as it appears to-day that the goods which this patent covers are of considerable value. A Pennsylvania manufacturer tells a story of the inventor of a multiple of rolls or trucks used under the bottom of railroad cars between the truck-frame and the body of the car. The inventor became pressed for funds and desired a loan of \$100, assigning his patent as security.

Out of sympathy, the manufacturer gave him the money, never expecting, as he says, to ever get a dime of it back, and threw the patent papers aside in his safe, where they lay undisturbed for 10 years. One day a lawyer of his acquaintance called at his office and inquired if he ever bought a patent on friction rolls for a railroad car. After reflecting a moment, he told him that about 10 years before he had loaned an inventor some money on a car patent, but he didn't ever expect to hear from it again. The lawyer told him that this patent was being used on almost every car now being built, and a large revenue could be collected. Terms were soon negotiated for collecting evidence of infringement; so that the loaning of \$100 to help out the distressed inventor brought him more money than all his other business.—Boston Journal.

NICKEL IN NEVADA.—Competent judges pronounce the cobalt and nickel mines of Churchill county the best in the world. Nickel is a metal which is entering all branches of metal manufacture, and its use is spreading rapidly. This general use renders it a very valuable metal, and a nickel mine which yields a fair quantity of ore is a good property, readily salable. The supply is still so small as compared with the increasing demand, that owners of nickel are not liable to suffer from a depression in prices, owing to an overstocked market, as are the owners of lead, copper and silver. Heretofore there have been no noteworthy discoveries of nickel in this country, but it may be that in the eagerness of search for gold and silver, nickel ledges have been abandoned as worthless after a simple gold and silver assay showed but a small quantity of either or both of the precious metals. It might pay our prospectors to give some attention to the character and appearance of nickel-bearing ores, as there is no reason why this country, with its wonderful variety of mineral wealth, does not contain one or more nickel mines. The owner of a good nickel claim has almost a mine of ready money, as purchasers will never talk low figures and delay on account of the condition of the market. The market for nickel will be a rising market for some years.—Walker Lake Bulletin.

TUNNEL UNDER CLAY STREET HILL.—It is proposed to tunnel Clay-Street Hill, in this city. Mr. Joseph Britton, of the Clay-Street Hill cable road, says that the proposed tunnel will enter the ground at Gough street, and will emerge therefrom at Laguna. "It will be about 900 feet in length, about 9 feet in height and 15 feet in width," continued Mr. Britton. "This will just enable our cars to get through, and no room to spare. Owing to its necessary width, the proposed tunnel will be square in shape and will be lined inside with brick. It will be perfectly well illuminated, for openings will be made in the street amply sufficient to let as much daylight in as will be required. At night the brilliancy of the electric light will be called into requisition for the same purpose. If this Board of Supervisors allows us to build this road, it will enable us to provide direct cable accommodations to a very large section of the city and to open it up. Apart from this, however, an extension of our system is now a necessary measure of defense with us, by reason of the construction of the Sacramento-Street road. We are the pioneers in the cable road system of San Francisco, and do not at all desire to be left behind."

THE "AMADOR LEDGER" has appeared in an enlarged form, so as to keep pace with improvements in its region. The *Amador Ledger* is one of those interior papers which pays great attention to its local mining interests, and we never fail to find, in every number, more or less mining items. It is doing good work for its county in this as in other ways. The city papers are to a great extent dependent for current mining news on the local papers, and if they would all, like the *Amador Ledger*, make a point of collecting and publishing all that is available, they would find it of great advantage to their mining interests. The *Ledger* is a good representative interior journal.

IN the District Court of Helena, M. T., judgment by default has been rendered against the defendants in the case of J. W. Seligman & Co. vs. the Gregory Mining Company for \$65,000. The case arose from the capture last January, by the miners at Gregory, of Hon. A. J. Seligman, son of J. W. Seligman, the rich New York banker, who was forcibly held at the mining camp until the New York Seligmans guaranteed the payment of back wages to the amount of the judgment obtained.

MESSRS. GAGE AND LEACH, of the Grand Central mine, Tombstone, A. T., about three months since bonded the Beck mine for \$75,000, making at the time a considerable cash payment. For some reason best known to the purchasing parties, the mine was soon afterward shut down, causing much wonderment among disinterested parties. Now, however, the property has been accepted, and a full force of men will be put to work.

THE Omega Gold Mining and Ditch Company has been fined \$500 by Judge Sawyer for conducting a hydraulic mine in contravention to the order of the Court. Damages were ordered by a recent report of the Master in Chancery. The company was given ten days in which to pay the fine.

The Proposed New Harbor at Los Angeles.

The most interesting and important engineering project which has recently been inaugurated on the Pacific Coast is the proposed new harbor for Los Angeles, at "La Ballona." An association of gentlemen, with a strong backing of capital, has been organized to carry on the work, which is already in an advanced stage of progress under the general management of Mr. James Campbell, well known on this coast.

Character of the Work.

Ballona lake is a body of water three or four miles south of Santa Monica, lying a few feet only from the seashore, and connected therewith by a shallow creek. The lake is from two to three miles long and about 600 feet wide, with an average of some 12 or 15 feet in depth. The soil is of a light sandy nature and easily handled with dredges. The work of constructing the harbor will consist of enlarging the natural channel connecting the lake with the ocean and excavating the bottom of the lake to a sufficient depth and extent to accommodate both ocean and coast trade.

The shores of the lake will be securely piled, in connection with which will be constructed wharf accommodations, wherby cars and ships may be brought side by side. This ocean connection will consist of an opening 200 feet wide, and of sufficient depth, with heavy piling and proper front and rear supports extending out to deep water, with a flaring mouth to render more easy the access of ships from the outer roadstead. The piles will be squared and securely bolted together so as to form a solid mass of timber, driven down into an under stratum of tough clay, giving the entire structure a firm hold on *terra firma*, to withstand storms. We are told that the entire sea bottom, at a distance of 1200 or 1500 feet from the shore line, consists of clay, and that there is 28 feet of water at low tide. Vessels can, in any ordinary weather, lay outside in good anchorage, with no rocks or shoals, and come in whenever they desire to do so. This fact greatly facilitates the delivery of material during the progress of construction. There is a flow of tide here of about 5 1/2 feet.

Not a New Project.

The construction of this harbor is no new project. It has been talked of for many years, and other parties than those at present holding the property have sought to secure it for a similar purpose. Some 12 years ago an eminent English engineer, Mr. Bernard, the builder of the famous Victoria docks at Edinburgh, examined the locality and expressed the opinion that it would at no distant day become the harbor of Los Angeles, from which it is distant less than two-thirds of the distance to the present harbor at Wilmington. The wharf and dock facilities within the lake can be extended as circumstances and the increase of commerce may require. It is expected that the work will have made sufficient progress by April or May to admit the entrance of

The First Ship Into the Harbor.

A harbor such as this promisee to be—easy of entrance, perfectly safe from sea and storm—cannot fail of adding greatly to the commerce and prosperity of Los Angeles. The work has been greatly delayed by the difficulty in securing piling, but the dredging operations have been carried on with a reasonable degree of dispatch, and piles, lumber, etc., for wharf construction will hereafter be promptly delivered. There is no lack of financial backing for the enterprise. As an evidence of the sheltered character of the roadstead outside of the entrance to Ballona during prevalence of southeasters in the winter months, we are informed that while during the recent southeast storm all the shipping in San Pedro had to hoist anchor and go to sea for safety, a ship at anchor off the harbor of Ballona rode out the storm without any trouble whatever.

The Work Already Done

Has created quite a boom in railroad building and in real estate transactions throughout all parts of the county. A company was organized some time ago to construct a double-track railroad from Los Angeles to the new harbor, the grading of which is in progress. Other roads are also in contemplation, both for Los Angeles and along the coast both north and south. The Atchison & Topeka will make a temporary connection with the ocean at this point, and will, no doubt, put on a line of fast boats to convey their passengers from thence to San Francisco. The construction of this harbor has opened new the rivalry between that and the Southern Pacific. There is no doubt but that these two roads will present a sharp competition for the overland business. Both are backed with almost unlimited capital, and with genuine push and enterprise. There will hereafter be a genuine competition between New England and California capital, or, as it has been otherwise expressed, between Noh Hill and Bunker Hill, and by it California will be largely benefited in both her transcontinental and in her local traffic.

Government Aid

Has not been solicited in this enterprise. Some steps should be taken to call the attention of the proper authorities to the claims and advantages of Ballona. A survey of the locality and a report

upon the matter should at least be obtained. Such a report would be of the highest moment, and national in character and importance. We are not aware that any steps have been taken to secure such attention, or even whether it is desired by those now engaged in the enterprise; but it is plainly within the scope and duty of Congress to act upon the matter, and we trust that some member of the Pacific Coast delegation will take the matter in hand at an early day.

In Los Angeles County.

Our engraving presents a few scenes in the San Gabriel valley and a pretty view in the Wolfskill orchard in Los Angeles City, showing especially a row of banana plants thriving in the open air. The upper scene in the engraving will give a general idea of a vineyard and orange grove, while far beyond are the slim plums of the sycalypsus. The San Gabriel valley is one of the grandest stretches of ground in California, of vast extent and varied adaptations, bringing forth under the magic wand of the irrigator a great profusion of valuable productions.

This view at Sunny Slope shows the residence of Hon. L. J. Ross, an agriculturist of great re-

The Cork Oak.

As we have started on the growth of the cork oak in this State, and the trees, now about 25 years old, have demonstrated the adaptation of our soil and situation to the tree, it is of interest to note corky information from the old producing countries. At the last meeting of the State Horticultural Society, Prof. Hilgard made some remarks, alluding to a recent French publication on the subject. It was shown that the supply of cork was diminishing, and that for certain purposes no good substitute for cork has yet been found. On the other hand, the uses of cork have multiplied. The cork plantations of France are becoming less in area and as yet little has been done to restore them. The subject is now being agitated in France, and the planting of cork oaks should be considered in all countries where it is likely to succeed. Of course such plantations must be considered in the light of permanent investments, and the benefits will accrue chiefly to our children and grandchildren, because of the length of time which must elapse before the trees are large enough for stripping.

There are two species of cork oak, the *Quercus suber* and *Q. occidentalis*. They adapt

nearly one-quarter over the old. It is understood that in the removal of the cork, the stripper does not go down to the living layer, and therefore does not actually expose the wood.

Prof. Hilgard, in closing his remarks, alluded to a possible large demand for cork dust, in which to pack California fruits for shipment, and stated that samples had been shown him of a corky bark produced in large quantities in Yesso, Japan, which seemed to be well adapted for packing purposes. If it should be found so, it would probably prove of much value on this coast.

Young cork trees are now growing at the University from acorns produced upon trees in Calaveras and Los Angeles counties. A plantation has already been made on the hills back of the University, and it is expected that young cork trees will be ready for distribution next year.

Industrial School at San Quentin.

It is stated that when the Senate Committee visited the State Prison at San Quentin Senator Jones, of Butte, asked how much it would cost to convert the door and sash building into cells for the occupancy of criminal boys. His idea was that it would be wise and humane to start a State industrial school inside the penitentiary, where criminals of this class could be taught some useful vocation separate and apart from the hardened veterans of crime. The suggestion is a good one, and will command the approval of every kindly nature. By all means do something of the kind, and if the aforesaid building cannot be spared or adapted to this purpose, then erect another. It would be hard to find any one who has made penology a study that has not denounced this folly and cruelty that herds in the same workshop young offenders along with the old and experienced villains who delight in the artifices and tricks of vice and crime. It is a vicious atmosphere for a boy to breathe in. The unconscious magnetism of such surroundings is debasing and perilous to every hope of reformation. It should always be assumed that there is something good left in a boy. That, however, had he may seem, there is still lingering in his soul some flickering sense of shame and quivering of the moral nerve of feeling that under judicious treatment may be quickened into an honest desire to lead a better life.

We are all more or less the creature of environment, and many of these had boys are the victims of the evil forces at work in the community. They have been wrecked upon social reefs. They have been swept away by the swift torrent of city habits, customs, and ways that older and maturer minds find it hard to stem. We were born with no purer blood than they, and might have gone astray as they have had we been reared in the same crowd and educated in the same domestic school. What sense is there, then in placing these unfortunate youths in the society of those who neither fear God nor honor man, who sneer at virtue and honesty as phantoms of the conscience, and look forward to the termination of their sentence as the time to wage a more cunningly contrived and relentless war upon society? One of the chief objects of the State Prison is the reformation of the criminal, but our present system, at least so far as the boys are concerned, is a mere recruiting station for the army of crime. How can they learn the beauty of virtue in daily contact with vice? There can be no hope of amendment under such circumstances. It is too high a marvel to expect. The chaplain may pray, preach, and distribute good books, but one hour in the prison workshop is enough to ravel out and dissipate every good intention. By all means give these youthful criminals a better chance to redeem the future.

THE TRANSVAAL GOLD FIELDS.—A Washington special says: Vice-Consul Knight reports to the Department of State concerning the Transvaal gold fields, that the wonderful Shelly reef has been eclipsed by another reef discovered last summer and known as the Thomas reef, from which samples of quartz weighing 3000 pounds, it is claimed, yielded 148 ounces of gold. These discoveries naturally gave an impetus to prospecting on a large scale, resulting in the discovery of marvelously extensive and rich gold quartz veins. The Vice-Consul says he believes that, after making inquiries and from the best information obtainable, the Transvaal fields, when fully developed, will prove among the richest in the world. The recent discoveries have naturally given rise to no end of speculation and mining ventures, and a great rush of capitalists, miners and adventurers has set in. Near Shelly reef the city of Warherton has sprung up as if by magic, numbering already 7000 to 8000 people, and is rapidly increasing. The report concludes by cautioning all persons without means not to venture into the gold country unless they have thorough practical miners, as the conditions existing are very hard, and many will be doomed to bitter disappointment.

BACK NUMBERS WANTED.—In order to complete certain files of the MINING AND SCIENTIFIC PRESS, we should be glad to get certain back numbers. Any one having any of the following numbers of the PRESS will please communicate with this office:

1859—Jan. 2d, 9th, 16th, Feb. 27th, March 20th, April 17th, 24th, May 1st, June 12th, 19th, 26th.
1875—Sept. 11th.
1880—July to December.

SCENES IN LOS ANGELES COUNTY, CALIFORNIA.

pute and popularity, who has done much to demonstrate what can be accomplished in California by the use of wisdom and earnest effort. Mr. Rose is at present a State Senator, and won much praise for his course during the present session. The palm trees on the right are the native California Fan palms (*Washingtonia filifera*), which is one of our grandest native plants. These views will give distant readers a little idea of some of the features of the San Gabriel valley, and form an acceptable addition to other engravings which we have given during the last few years.

SPRING VALLEY MINE.—From the report of the State Mineralogist, Wm. Ireland, Jr., we take the following items of interest connected with the Spring Valley mine at Cherokee, Butte county: The expenditures of the mine from July, 1870, to July, 1886, were for reservoirs, ditches and pipes, \$510,820.50; mining plants and tunnels, \$199,780.55; mining ground purchased, \$419,396.18; land purchased, \$461,435.87; cost of debris canal, \$270,821.43; mining expenses including care and repair of ditches, \$1,759,853.77, making a total of \$3,622,198.44. The value of the gold recovered for the same period was \$5,008,108.62, giving \$1,386,010.18 as the profits for the mine during the 16 years. The same report estimates that prior to 1870, \$5,000,000 was taken from the same locality, making the amount of gold that the Cherokee mine has returned as \$10,000,000.

themselves to nearly all soils, but prefer lighter soils, the granitic and slate soils of the foothills for example, the distribution being probably something like that existing with our "blue oak." As for stripping the bark, there are two methods in vogue. The old style was to begin at the time the tree was 22 inches in circumference, at whatever age, but usually at 20 to 25 years. The first bark is coarse and full of seams and is only fit for coarse uses, such as grinding up for packing, etc. It is necessary to be careful in removing the bark and the section of bark removed should not be over 50 inches in length along the trunk. After the first removal the bark is removed about once in 10 years. Ordinarily there is a loss of 18 to 20 per cent in waste in the bark, and sometimes 50 pounds removed will only yield 20 pounds of good cork. The waste is largely occasioned by little holes and by big cracks. Many trees are lost after stripping by this method, and the bark when removed has to undergo a long process of drying, etc., so that the losses incident to the business are considerable.

In the new style of stripping, the first bark is replaced upon the tree after being separated, and the new bark growing under it is thus protected and the tree preserved from injury by the sun shining on the bare trunk. This method seems to be a great improvement over the old way. Taking into consideration the improvement in the quality of the cork, the advantage of the new method is estimated to be

Passing Events.

The Fine Gold mines, in Fresno county, are just now attracting considerable attention, and travel in that direction is said to be quite heavy. Some of the mines there are turning out very well. Hildreth is now quite a lively camp.

It has been announced this week that Dr. Cogswell, of this city, is about to make a gift of \$1,000,000 to found a technical school in our midst. With the technological department of the State University, the proposed Leland Stanford, Jr., college, at Palo Alto, and Dr. Cogswell's school, this part of the world will in time offer very superior advantages for industrial and technical training for the young of both sexes.

An evident awakening to the value of our resources is pervading the whole State, and nearly all the interior towns are carrying out or planning improvements. Real estate is advancing everywhere, more particularly, however, in the southern regions, which are also still receiving the largest number of the new settlers. The overflow is coming northerly, however, and the State is rapidly being settled up.

In a very few weeks more the prospectors who have been hibernating for some months will again take the field. They begin their work early in this State. It is evident that there will be quite a boom this summer in quartz mining in California.

St. Louis, Missouri, is just now in the midst of a mining excitement. Capitalists from there are buying mines all over the country,

Another First Discoverer of Gold in California.

And now have we another candidate for the honor heretofore awarded James W. Marshall, as the original discoverer of gold in California; the claimant in this instance, or rather he on whose behalf such claim is urged, being one John Denton, deceased, and concerning whom the story, as related by a survivor of the ill-fated Donner party, runs in this wise: The Donner party, composed of immigrants to California, while attempting in the fall of 1846 to make their way over the Sierra Nevada, became snow-healed on the eastern slope of these mountains near where the town of Truckee now stands. Denton, knocking off pieces from the rocks used as a fireplace in the cabin occupied by a portion of the party, noticed among the chips some shining particles, which on examination proved to be gold. Collecting about a tablespoonful of these particles, Denton wrapped them up in a piece of buckskin and put them in his pocket. Perishing afterward while struggling to get over the mountains, the hero of this story was hurried, and with him the piece of buckskin and its contents. Aware of this fact, other members of the party, who

down, and, grabbing a handful of the precious sand, brought it away with him. Having eluded their pursuers, the pursued, gaining an eminence and looking back, descried the beach for miles and miles literally covered with sparkles of gold!

Now, for the future guidance of this class of romancers and prospectors, let it be observed that gold, as it occurs in nature, never presents the appearance above described. It does not shine and glitter and dazzle, but is a dull, lusterless metal, no more likely to attract attention than a piece of putty; a fact that by the gettters-up of these narratives should hereafter be borne in mind. In poetry it is admissible to speak of gold as being bright, sparkling, resplendent, etc., but not in sober prose.

While there is no call for excess of zeal in dealing with these harmless legends, so pleasing to the popular imagination, still there must be drawn a dividing line somewhere in this border land between fact and fiction. To multiply the number of original gold discoverers in California, or add further to the hook of the mining apocrypha, already large, would be more than superfluous.

To talk about knocking off pieces of rock and picking out gold from the chips, and this

THE LATE JAMES B. EADS.

had been fortunate enough to make the passage of the mountains safely, determined to go back and hunt for gold in the neighborhood of this reputed find, and would have done so had not the discovery of gold at Sutter's Mill deterred them from carrying out such purpose.

The ignorant romancer, like the unskilled criminal, ever betrays himself. The discoverer of the mythical gold find, in explaining how the thing was brought about, proceeds in his innocent way to tell how his attention happened to be attracted by something glittering in the sand or on the rocks, and which, when he came to take a closer look at it, turned out to be gold. Sometimes this stuff shines with an effulgence that fairly dazzles the eyes of the beholder—it almost flashes with more or less intensity.

When questioned as to how it happens that so little of the gold discovered on these occasions is secured and brought away, the authors of these Munchausenisms have ever a way for explaining this: Sometimes the murderous Indian swoops down upon the adventurous prospector, just as he is about to pick up the first piece of gold in sight; or at that critical moment his gun gives out, or a heavy snowfall impending warns him to leave, or may be, as with John Denton, he "pegs out" while on his way into the settlements, there being always an interposition of providence or of improvidence in the case. The discoverers of Gold Bluff, we are assured by one of these veracious chroniclers, were fleeing for their lives, with 1000 savages, more or less, close at their heels, when one of their number, riding full speed, reached

from rock obtained in a non-auriferous locality, is far from drawing the thing mildly! By no such testimony as this or other tradition of "Starvation Camp," can John Denton hope to establish a claim to being the first discoverer of gold in California. Let the grave-stone for which our Legislature has just made provision be placed over the remains of James W. Marshall at Coloma.

CALAVERAS MINING NOTES.—One of our correspondents who is traveling in Calaveras county states that mining matters at Douglas Flat have been at a standstill for a long time, but there are negotiations now pending which will undoubtedly start things "booming." To add to their other troubles, there has been a scarcity of water in the ditch; but a new company has taken hold of it and greatly enlarged its capacity. At Murphys, nothing is being worked with the exception of the Oro Plata, where they are working day and night shifts and look for good results. There will doubtless be considerable work done at this place this summer.

The total sum disbursed to employees by Comstock mining companies during the month of February was over \$200,000—a decidedly good showing for a mining town that is said by some growlers to be played out.

The Carson mint has an appropriation of \$114,500. The money is divided into three classes, viz.: \$29,500 for salaries, \$60,000 for wages of day laborers, and \$25,000 for incidental expenses.

The Late James B. Eads.

Captain James B. Eads, the widely known engineer, died suddenly on the 6th inst. at Nassau, of pneumonia. Captain Eads attained fame from his engineering work at the mouth of the Mississippi river, and from his project of building a ship-railway across the Isthmus of Tehuantepec. He was a practical engineer in every sense of the word, and was held in design and skillful in execution of his plans. For more than a quarter of a century he has been engaged in works of the greatest magnitude, which have given him a wide reputation.

Captain Eads was born in Lawrenceburg, Indiana, May 20, 1820. When about 10 years old his father fitted him up a small workshop, and there he constructed models of sawmills, fire-engines, steam engines, and other machines. When 13, misfortune overtook his father, and he had to withdraw from school and work his own way. His parents went to St. Louis in 1833, and he went with them. The steamer was burned in the night on the way there, and he landed barefooted and coatless. The only opening in the way of business that offered was to sell apples on the street, and by this means for a few months he sustained himself and assisted in supporting his mother and sisters. In time he obtained a situation with a mercantile firm, where he remained for five years. One of the heads of the house having an excellent library, gave him access to it, and he used his opportunity well to study subjects bearing upon mechanics, machinery, civil engineering and physical science.

In 1839 he obtained employment as a clerk or purser of a Mississippi river steamer. He again made the best use of his opportunity to acquire that complete knowledge of the great river which he was afterward able to turn to such good account.

In 1842 he constructed a diving bell to recover the cargoes of sunken steamers. This was followed with a boat of larger tonnage, provided with machinery for pumping out the sand and water and lifting the entire hull and cargo of the vessel. A company was formed to operate this device, and it soon had a business that covered the entire Mississippi river from Balize to Galena, and even branched into some of its tributaries.

At the outbreak of the Civil war, in 1861, he submitted to the Government a plan for the defense of the Western waters. He designed and constructed, in 1862 and 1863, the first eight ironclad steamers in the United States navy. He afterward designed and built six ironclad gunboats with rotating turrets. The gunboats that he built for river service enabled the Government to regain control of the Mississippi, and were of immense advantage in assisting the land forces in many notable movements.

In the interval between 1867 and 1874 he designed and constructed the great St. Louis bridge, one of the great engineering feats of this century. The jetty system of deepening the entrance of the Mississippi was carried out by him at his own risk, in the face of the most determined opposition from army engineers, who declared his plans impracticable. Permission was at last granted him to experiment upon the most unfavorable pass. As a result, the largest ocean steamers can sail to New Orleans without difficulty through a channel which was previously only useful to small boats. It may be noted that all his theories on the jetty system have been borne out by experience.

Of late years Captain Eads has interested himself in the great scheme of building a ship railway across the Isthmus of Tehuantepec. His plans on this subject we have described and illustrated fully in the Press. This project will be carried out by the company on Capt. Eads' plans.

Capt. Eads, whose portrait we give on this page, was at one time Consulting Engineer of the State of California, having been appointed to fill the place made vacant by the death of Col. B. S. Alexander.

BAKER CITY, OREGON, wants custom reduction works. Hundreds of discoveries within a few miles of that city are owned by men too poor to erect a mill on their property for the reduction of their ore; but if Baker City was supplied with reduction works they would be constantly furnished with ore for crushing and thus open up a new field of industry for the laboring classes.

Slimes in Ore-Crushing.

We had a conversation this week with Mr. F. B. Morse, superintendent of the Willard Mining Company, at Murphy, Calaveras Co., where they have had some very interesting experience with the question of sliming of ores in crushing. The ore is quite peculiar, and slimes badly under stamps, so much so, in fact, that it was a losing proposition with an ordinary mill. They finally settled on using the Tustin mill, which is found satisfactory and makes very much less slimes. Mr. Morse states that it is found by experience that one Tustin mill equals in capacity six stamps. He says it works a cheaper than the stamps, and as now made is a very perfect machine. One set of steel castings for this mill he is sure will last for several years. With the stamps they only got 12 per cent out of \$12 rock, which, of course, would not pay.

Mr. Morse has made some very careful experiments for purposes of comparison, everything being weighed, assayed and tested with precision. With the stamps, crushing through a No. 6 slotted screen, with two-inch discharge and narrow mortar, they used to get 45 to 48 per cent by weight, that he could slime off by shaking and pouring off water quickly from a pan. Some 90 per cent of the value would go off in this way.

In the Tustin mill only from 8 to 12 per cent of slimes were made, crushing through a wire screen of corresponding number to that used with stamps. They could slime off from 8 to 12 per cent by weight, with proportion of value in slimes about the same as above.

Mining men who see the ore say it is easy to concentrate. But none who ever tried it could crush up the rock by hand in mortar and save 25 per cent of the sulphurets. It shows that the stuff will slime at the slightest blow. The galena and zinc blende in the ore are had. The galena runs high in gold and the zinc blende in gold. The rock must be worked very carefully. In crushing, no chance must be given for a second blow. It is for this reason that the Tustin mill does so much better work on this rock than stamps do. The Tustin screens off as fast as the ore is crushed. The moment a piece of ore is crushed it is screened off and is not hit another blow; this is not the case with stamp batteries. As Mr. Morse puts it, the Tustin has an actual discharge; stamps an accidental discharge. There is a 15-stamp mill on the property now, but it is not used for crushing this particular class of ore. There are four Tustin mills and six Frue concentrators.

At one time they had a lot of 200 tons of ore worked that assayed \$12 per ton. It was put through the stamp mill and over the concentrators. They saved \$2 per ton in gold on the plates, and got concentrates that assayed \$25 per ton. The tailings assayed nearly \$10, and there were three tons of concentrates.

Another lot of the same ore was then run through the Tustin mill, and they got out in gold and concentrates over \$10 per ton—nearly \$11. The run was made under the same conditions in both cases, concentrators and all. From the stamps they recovered \$2.25 per ton, and from the Tustin mill \$10 to \$11.

In one case they got \$2 in gold and 25 cents in mineral, and in the other they got \$4.50 in gold and \$5.75 in mineral. This test went to show that the stamps slimed the ore more than the other mill. The gold is very fine. The amalgam from the stamps retorted one-sixth, and that from the Tustin retorted little better than one-fourth.

Mr. Morse has no interest in the Tustin mill, but finding they could not use stamps to profit, considered that would be the best way. He first thought of using the Cornish rolls, but then saw the Tustin machine and thought it would be better than the rolls, as it has no fixed hearings, so there is even less chance of sliming the ore than with rolls. Experience has borne out this expectation.

THE Order of boiler-makers of California has addressed to the public of the Pacific Coast, and employers of steam generally, a request that in future all boilers be manufactured in this State. The notice is an earnest appeal for the recognition of home industry.

MORE gold discoveries reported near Atlanta, Georgia, have caused considerable local excitement.

Lands Now, Mines Next.

There is just now an unwonted inquiry for real estate in California—the desire of everybody is for land. There is, so to speak, a "boom" in property of this kind, and, while our lines fall outside the agricultural and hucolic, we are "agresable." It is lands now; it will be mines next. Either are good things to put money into. No industry can be more solid and financially healthful than farming and gold mining in California. Conducted with even a modicum of business sense, they cannot fail to be both safe and profitable. They ought to win to them toilers without number and capital without stint.

While we would be glad to see a little more attention paid to mining, that interest is by no means being neglected. It is, in fact, in a very

the experience of the former large land-owners in California, who, years ago, under the impression that land could never be of much value in this State, sacrificed possessions for a mere song, which, had they held on to them till to day, would have made them millionaires.

Proposed Technical School.

It is stated that Dr. Henry D. Cogswell is taking steps to found an educational institution in this city, for which purpose he proposes to transfer property valued at \$1,000,000. Dr. Cogswell is well known as the gentleman who has put up, at his own expense, public drinking fountains in several cities in the United States. The proposed polytechnic school will be one to which any boy or girl over the age of 14 is eligible. The examinations for admission

THE HAZELTON BOILER-ENCLOSED.

prosperous condition. We deprecate any attempt at hoarding the business. The less of this the better. Undue excitements work it nothing but harm, the only parties who benefit by these movements being the dealers in wildcats and the manipulators of the mining share market.

If investors do not want our mines there is no particular necessity for our selling them. The owners are, as a general thing, able to hold them, and may very often find it to their advantage to do so. Nothing keeps so well as gold in the ground. It does not rust or waste or suffer loss by wear, nor does its storage cost the owner anything. The value of a good gold mine, instead of depreciating, grows in value year by year. Therefore the owner, unless forced to do so, should never sacrifice a property of this kind. They will be wanted by capitalists one of these days, and they will then be willing to pay a good price for them. Our miners might learn a useful lesson from

will look to the mental, moral and physical capacity of the applicant.

The building will be erected on the block bounded by Folsom and Harrison and Sixth and Seventh streets, and the length of the main frontage will be 500 feet. There will be at first accommodations for 200 pupils, and these will be enlarged as the applicants increase in numbers. It is proposed to give the students a more practical education than they can now receive in the public schools and colleges, and to fit them before leaving school for the competition which they will find among skilled labor in the shops.

The girls will be taught trades to which their physical strength may be adapted, such as wood carving, engraving and the like. The entire plan of the institution has only taken shape within the past six weeks, but it is stated that by the 1st of January, 1888, the school will be opened to admit those who have passed a satisfactory examination. It is to be hoped that

this gift will be made free from restrictions which may hamper its usefulness. When James Lick first began to give his fortune away to the public, he placed many restrictions in the way. Fortunately, before he died, he saw the bad effects of these, and by new deeds removed them and allowed the bequests to be carried out according to the best judgment of the trustees. Dr. Cogswell's deed of gift has not yet been recorded, so that it is as yet impossible to say under what exact conditions the technical school is to be founded and carried on.

Mining Suits.

A fine of \$500 has been imposed against the Omega Gold Mining and Ditch Company by Circuit Judge Sawyer, payable to the complainant in the mining-debris case of E. Woodruff vs. the North Bloomfield Gold Mining Co. The Omega Co. has been previously reported in contempt for violating the decrees enjoining the dumping of mining debris into the Yuba and Feather rivers.

In the Circuit Court on Monday, Judges Sawyer and Sabin dismissed the suit, entitled the Southern Development Co., of Nevada, against Frank Silva. The plaintiffs alleged that on February 15, 1884, Silva sold them a salted mining claim, known as the Sterling mine, in the Darwin district. The price paid was \$10,000, Silva representing that there was 2000 tons of valuable ore in sight at the time of the sale. The suit was instituted to compel the repayment of the \$10,000.

Suit has been entered in the United States Circuit Court by R. H. Elam and James M. Fadden to recover a judgment for \$31,000 from Lazard Freres & Co., the bankers. The judgment asked is for damages alleged to have been suffered by the owners of the Independent mine, near Pioche, in Nevada, by reason of its closing down in October, 1885, about which time the defendant in the present action brought an action in ejectment against the mine-owners and caused an injunction to be placed on the property, shutting up the mine and closing down the mills. This suit, which the present complaint alleges was brought to harass and annoy the owners, was dismissed because the wrong persons were sued.

The case of the Excelsior Water and Mining Company of Yuba and Nevada counties, Cal., against J. P. Pierce, was argued this week before Judge Wilson. The complaint was brought for the recovery of \$266,000, which, it is alleged, the defendant, as director of the Excelsior Water and Mining Company, caused to be paid out, not of the surplus profits, but of the capital stock of the company. It is alleged by the plaintiff that 19 separate dividends were paid during the regime of the defendant as a director, and that the surplus profits of the company did not warrant these dividends, as they were taken out of and impaired the capital stock of the company. The question to be decided by the court was simply whether the allegations of the plaintiff were supported by the evidence. The defendant denied the allegation, and it was urged that during his regime as director he had purchased, improved and added to the property of the company to the extent of nearly the same amount as that paid out in dividends, the payment of which was now the cause of action.

The large two-story frame hotel owned by the Spring Valley Mining Company, at Oberon, was totally destroyed by fire last Sunday, together with the barns and outbuildings belonging to it. The cause of the conflagration was no doubt the work of incendiaries, as the fire upon first discovery was found in several parts of the building.

The "Allison Ranch" gold mine, limited, is the name of a new company for which subscriptions are asked in London, England. This company has been formed to purchase the "Allison Ranch" mine, of Grass Valley, Cal. It was formerly the richest mine in Nevada county, and if reopened may again become famous.

SURVEYORS have commenced running the line of the branch of the South Pacific Coast railroad from Felton to the petroleum rock deposits, now so extensively used for paving purposes. The line, if built, will be about seven miles in length.

MECHANICAL PROGRESS.

Mechanical Progress.

The inventions and discoveries of the present era are announced in such quick succession, and some of them are so startling in character, that people involuntarily exclaim: "What next!" Indeed, so rapid is the real progress of invention and discovery that the world is now pretty well prepared for anything, no matter how improbable or apparently impossible it may appear.

In the language of a cotemporary, "The many wonderful discoveries of late years in the science of metallurgy, or, more properly speaking, the art of working metals, comprehending the whole science of separating them from other matters in the ore, smelting, refining and parting them, have been of such frequent occurrence that men who desired to invest millions of dollars in a steel plant have hesitated and considered long over adopting any one process in preference to another. * * * The last quarter of a century has witnessed an intense interest on the part of inventors and metallurgists in the manufacture of steel. Its varieties in modern practice are now very numerous, many of them having a peculiar adaptation to a certain specific purpose in the arts. Among them are natural steel, India steel or wootz, puddled steel, or semi-steel cement steel, or blister steel; cast steel, Bessemer and kindred steels, Siemens-Martin steel, steel by the Clapp-Griffiths process, steel by the Bessemer process, claimed by Rees; steel by the open-hearth process, claimed by Henderson; phosphorus steel, the invention of M. Tessie du Motay; mild or low steel, tungsten steel, a steel containing tungsten—a metal of grayish-white color; beside the above, some other varieties."

To the above may be added the wonderful progress which has recently been made in the production of aluminum. Improvements have been introduced in producing that metal which have revolutionized the markets of the world in regard to its cost, and which bid fair to make it, at an early day, one of the chief component materials of innumerable utensils of domestic and other use. In view of what has already been done in this direction, it is by no means an improbable thing to suppose that we may soon see an effective cannon for field use made of this material, and yet so light that it may be trundled over a field of battle by a single animal or even pecked on the back of a mule.

And now comes Mr. I. W. Miles, a blacksmith at Louisville, Ky., with a new process for making steel, who, it is said, converts any common iron into a finer steel than has heretofore been produced, and who announces that he is able to convert iron into the finest and purest steel in a few days at a mere nominal expense. A public test was recently made, and the experiments are reported to have demonstrated that "no metal ever known was equal to the Miles steel." This is certainly saying a great deal in view of what has already been done in this direction. We append an account of some of these experiments as given by the *Louisville Courier-Journal*:

"Mr. Miles then produced a common, cheap, black-handled pocket-knife, such as are made of very low grades of cutlery steel. He had removed the blades and returned by this process, converting them into a very high grade of metal. He then took a common steel key, one of those on his key-ring, and, with the knife-blade, whittled the stem of the key with little more effort than it would require for a good penknife to cut a silver dollar. In this case it was steel cut steel. After whittling a minute or two, he opened his hand, strapped the blade on the palm two or three times, and then, turning up his shirt sleeve, shaved the hair off his forearm with the same blade, almost as neatly as a razor could do the work.

"A thorough and last test of the value of his steel was then made. A bar of ordinary soft tire steel was sent for. When it came, Mr. Miles took it into his forge-room, and in exactly eight minutes he had forged a single small cold-chisel from one end of it, which he tempered by his process. Taking a burglar-proof safe-plate, he put it in a vice, and, with the still warm chisel, cut the hard edges and edges as readily as an ordinary cold-chisel would cut iron. He then substituted a more difficult plate to work on, and while the chisel cut the middle plate readily, it made only a slight impression upon the hard open plates. Mr. Redman then took one of his finest cold-chisels, made of imported steel, and it also failed to cut the steel plate. A decided difference of results, however, was obtained, for while the edge of Miles' chisel showed practically no injury from the attempt, not being turned or broken, there was a great, yawning gap in the edge of the imported chisel."

The inventor is a young blacksmith who has been experimenting with the process for years, and who claims that this tempering is done without expense or skilled labor. He has also a new process for converting iron into steel at small expense. He claims to be able to make steel plates so elastic and hard as to turn a ball fired from the heaviest gun ever constructed. The invention is a secret, not having been patented, and a company has been incorporated to push it, with Charles Godshaw as general manager. It is intended to call the attention of the Navy Department to the discovery and ask for facilities to test the steel made by the pro-

cess. Builders of steel plants will do well to look into this matter before investing further in any of the present appliances. There may be a possible future value in it. So far, the evidence of its value seems to come from authentic sources; still there are many who entertain grave doubts as to the value of the alleged invention. Be the invention what it may, it will at least have the effect for a time to arrest the attention of metallurgists in every part of the civilized world.

Rustless Iron.

M. de Meritens' process for rendering iron oxidizable is attracting considerable attention. He is continuing his experiments and has obtained some further results, which seem likely to be of practical importance. The method of protecting an iron or steel surface by the electrolytic formation of a coating of the black magnetic oxide has already been taken up in France as a commercial process. Experiments in this direction have also been undertaken by the French armaments, and are understood to have led to satisfactory results. M. de Meritens describes his later researches in a note presented to the French Academy, as follows: "When we submit a piece of iron to the action of the current in a bath of cold water, the formation of magnetic oxide does not immediately take place. The surface of the metal is in the first place coated with a layer of the protoxide of iron. This is a body of which little is known at present; it has not been completely studied by any chemist. Berzelius undertook a prolonged investigation of the substance, but he has never completed the work. The protoxide is the least stable of the oxides of iron. If it is produced by precipitation from a salt of iron, it is immediately converted into the sesquioxide. A similar conversion into the higher oxide takes place when the protoxide formed upon the surface of the metal by electrolysis is exposed to the air, or if the electrode is allowed to remain in the bath after the cessation of the current. If, however, the sheet of iron coated with the protoxide is immediately transferred to a bath containing a solution of a suitable salt of some other metal, such as copper, silver, gold, or aluminium, a perfectly adherent layer of this metal is immediately formed upon the iron. It is probable that the action is due to a partial reduction of the protoxide by hydrogen, and the formation of an actual alloy between the two metals, both of which are at the moment in the nascent condition." M. de Meritens exhibited specimens of iron coated by this process with the several metals named above.

RAPID PRODUCTION OF SOFT STEEL.—The English correspondent of the *American Manufacturer*, in a recent letter, says that an important improvement in the method of manufacturing soft steel, in rapid and continuous quantities, is being carried on upon a modest scale at the works of Messrs. Hatton, Sons & Co., Bilston, manufacturers of best sheets and tin plates. The improvement is of the firm's own invention, and they claim to have overcome the difficulties with the old form of converter of Sir Henry Bessemer, in respect to the necessity for keeping on the full pressure of the blast during the tapping out of the metal, as well as securing important advantages in respect of rapidity and efficiency of working. The steel which is being produced is very soft, and adapts itself admirably to welding and stamping. The carbon is exceedingly low, the average being .05 per cent to .10 per cent, and seldom exceeding .15 per cent. The silicon appears to be more thoroughly removed than in the Bessemer process as generally practiced, and Messrs. Hatton express much satisfaction at the working of the new system.

COMPOUND STEAM ENGINES.—The four cylinders of a quadruple expansion engine are arranged in tandem pair with the smaller of each pair nearest the crank shaft, in order that the piston, cover and valve of the smaller cylinder may be withdrawn through the larger. The cylinders are preferably arranged with the first before the second, and the third before the fourth-stage cylinder. The cylinders of each tandem pair are either set close together with a single partition-plate bolted to the bottom of the large cylinder, and containing a stuffing-box, or they are separated by a short space. In the latter case, the bottom cover of the large cylinder is bolted down from the inside, and when removed, leaves a space large enough to allow the cover and piston of the smaller cylinder to pass. In this case, also, the stuffing-box of the lower cover is prolonged and passes through that of the upper cover, the former being packed from inside the cylinder. The arrangement of the valve chests is similar to that above described for the cylinders. Manhole doors are fitted in the sides of the cylinders.

NEW STEAM-ENGINE PATENT.—Chas. F. Chandler, of Newark, N. J., has recently patented the combination in a steam engine of a cylinder provided with a port opening at the end of the cylinder, a port opening at the center of the cylinder and an exhaust port, and two pistons operating in said cylinder and actuating the main shaft by suitable connections, with an eccentric placed on the main shaft and operating the rocking arm, and an oscillating valve having an aperture and a recess in its bottom, and suitably connected with the rocking arm operated by the eccentric.

SCIENTIFIC PROGRESS.

Which is Driest—Steam or Furnace Heat?

A correspondent inquires of *Carpentry and Building* which is the driest, furnace or steam heat. "By furnace and steam heat I mean that which comes to the room through hot-air pipes from an ordinary furnace placed in the cellar, and that given off by steam radiators or steam pipes in the room itself." In reply, it is supposed that the hot-air furnace takes air from out of doors and that a water-chamber is provided for moistening the heated air; also that the steam radiators are of the ordinary kind, and without any connection with the outer air. Under such conditions, the steam heat will be the drier, for the air of the room is heated by radiation from and contact with the radiators, and the amount of moisture in the air remains unchanged. On the other hand, the heated air from the furnace has taken up moisture from the water-pot, and it carries this moisture to the room which is heated. These conditions, however, may easily be changed. For instance, if the furnace has no water-pot, and the day is exceptionally dry, the heated air which rises through the registers will also be very dry, and the effect will be practically the same as if radiators were used, so far as moisture is concerned. Again, if a pan of water be placed on the radiator, the air of the room may be made as moist as is desirable. The whole question simply depends upon the amount of water present in the air, the heat itself, if we may use the expression, being the same in all cases. It should be borne in mind in this connection that the sensation experienced of moist or dry air is largely governed by temperature. Of two bodies of air of different temperature, but each containing the same amount of moisture, the one highest in temperature will feel the driest. This will be understood by briefly explaining that the cause of the sensation of moisture or dryness in air is the evaporation of the moisture from the skin. If the air is dry, a rapid evaporation takes place; but if humid, the evaporation is very slow.

Heating the air does not increase nor diminish its moisture "provided no water nor damp bodies be brought in contact with the air."

A New Tanning Substance from Coal.

There seems to be no end to the variety of new products from coal. It is but a few weeks since the discovery of a new saccharine substance was announced, exceeding all others in the intensity of its sweetness, and now we have still another substance, which will be known as "pyrofluxin," which it is claimed may be economically used for tanning leather, and for disinfection generally. The discoverer is Prof. Paulus Reinsch, of Erlangen, Bavaria. Unlike the generality of such compounds, this new material, it is said, is not a derivative of coal tar, or of any of the distillates of coal, but is obtained directly from coal itself. Pit or bituminous coal contains most of it, and is prepared for treatment by being broken into nuts. The crude pyrofluxin is extracted by repeated boilings in a solution of caustic soda. The pyrofluxin enters into solution, and is allowed to stand for a time. It is then poured off, and a carbonic acid gas is passed through it. The resultant liquor has a specific gravity of 1.025 to 1.030, and holds from 10 to 15 grammes of pyrofluxin to the liter. In its purified form the compound is a fine, non-triturable substance, without taste or smell, non-poisonous, and in appearance like catechu. Some Russian coals contain 18 per cent of pyrofluxin. After the extraction of this material, the coal remains combustible. It is described as being one of the most powerful and effective antiseptics known to science. On this account it is expected to be most valuable for tanning, as being 28 times quicker in action than bark, and producing a better result at decreased cost.

It will be soon enough to give credence to this alleged leather-tanning agent when specimens of good leather are produced.

ELECTROPLATING WITH PLATINUM—ITS USES.—Platinum has not been much used in electroplating, notwithstanding its hard, durable, and protective properties. This is, perhaps, chiefly owing to the practical difficulty of obtaining a good, firm "reguline" deposit. A process for effecting this has, however, been brought out recently by a Mr. Bright, whose patents have been acquired by the Bright Platinum Plating Company, and are in actual operation in London at works established there. Platinum has the advantage of keeping its color where silver, brass, or copper becomes discolored, and will, to some extent at least, replace the use of these metals in electrotyping. It will be highly useful in plating chemists' crucibles and so on. German silver, for example, plated with platinum can be used to manipulate strong acids. By the Bright process, platinum can be deposited on any surface which can be electroplated with other metals.

THE FORCE AND EFFECT OF TERRESTRIAL CONTRACTION.—From experiments by Colonel Totten, Lyell has calculated that a mass of sandstone a mile thick, raised in temperature 200 degrees F., would have its upper surface elevated 10 feet; and that a portion of the earth's crust 50 miles thick, raised 600 to 800

degrees, might produce an elevation of 1000 to 1500 feet. Cooling again would reverse the result. Such cooling has actually taken place, and the contraction has given the earth its irregular surface and gigantic mountain wrinkles. That the process is still going on, we have frequent evidence in earthquake phenomena. In changing to a solid form the earth's shrinkage must have been much greater, as the common minerals lose from 3 to 11 per cent in hardening from a melted state.

A NEW SUN THEORY.—Sir William Thomson, in a recent lecture at the Royal Institution, enunciated a new theory concerning the original condition of the sun. He suggests that its mass was formed by the collision of two cool bodies coming together with the velocity due to their mutual gravitation. This theory is supported by the physical law that two bodies at rest in space, if free from the disturbing attraction of other bodies, would certainly collide with direct impact, and hence with no rotational momentum of the compound body formed by the collision. The velocity which a body thus falling into the sun would acquire is more than 30 times that which our earth has in its orbital motion. The earth speeds along its orbit at a rate exceeding 18 miles per second, but a body falling freely into the sun would have a velocity of 350 miles per second. Sir William Thomson, therefore, calculates that if two cool, solid globes, each of the same mean density as the earth, and of half the sun's diameter, and twice the sun's distance from the earth, should collide, the collision would last for a few hours, in the course of which they would be transformed "into a violently agitated incandescent fluid mass, with about 18,000,000 years' heat ready made in it, and swelled out by this heat to possibly one and a half times, or two, or three, or four times the sun's present diameter."

AN IMPORTANT INVENTION.—A recent invention promises to make the waste of pine saw-mills available for paper pulp. In reducing the wood to pulp, bisulphate of lime has been used, and this powerful chemical acts on the fiber only when heated. Heretofore, nothing but lead-lined boilers would resist its action, and these were too costly and too hard to keep in repair. A German scientist has, however, discovered a kind of brick lining for boilers that serves the purpose. The wood, sawed in small pieces, is digested with the bisulphate in large boilers lined with this brick, heat being supplied through lead steam pipes. Nothing further, except thorough washing of the fiber, is needed. The bisulphate is made on the spot by passing sulphurous vapor through porous limestone kept thoroughly wet. The only mill in this country as yet in Alpena, Mich. Slabs and other refuse of sawmills are used, the bark being removed by machinery. If the process is not covered by patents, nor the mills using them restricted to a small number, there is a prospect that our poplar trees will not be cut off so rapidly in many sections of the country.

FOSSIL CHARCOAL.—A correspondent of the *Scientific American* says: Perhaps charcoal has not often been observed as occurring naturally with mineral coal, though, as a result of metamorphism, graphite is not uncommon in coal districts. In a variety of bituminous coal that comes from Tennessee, there are to be seen along the cleavage planes films of true charcoal, in varying quantity, but commonly thin. This coal has been coming to us for several years, and all the while I have noticed in it the presence of the charcoal. I have scarcely ever put coal into the fire without making the observation; and there is perhaps not a lump, of size at all considerable, that does not contain these films. On close examination I have frequently found that the surface of the films on the broken lumps contains a delicate tracery, closely resembling vegetable impressions. The tracery is not so well marked as a fossil imprint, but not so indistinct as to escape notice.

PHOSPHORESCENT ALUMINA.—Mr. Crooke has communicated a paper to the Royal Society on the phosphorescence of alumina *in vacuo*. In 1879, he showed that ruby (a form of alumina) glowed with a rich red in the electrical vacuum, whatever the natural color of the stone. Recent experiments with a large spectroscopic confirm his earlier observations. The spectrum of the light shows a faint and hazy pair of bands and a double crimson line characteristic of alumina. There are also a pair of fainter orange lines, then a dark space, and after that a continuous spectrum extending to the green. Whether the crimson line is really due to alumina or to impurities does not, however, seem as yet to be beyond all doubt.

ELECTRIC LIGHTS.—At a meeting of the Oakland City Council last week, John Desbeck, attorney for the Pacific Coast Electrical Construction Company, appeared on behalf of the application of the company for an electric-light franchise. He said that the company was a home enterprise and represented California capital. The company has abandoned the Hieth system, and is now using the Wiese patents, which are owned by them. The company is willing to give bonds to comply with the provisions of the franchise. They propose to invest from \$35,000 to \$40,000 in Oakland, and will furnish the lights free for the use of the city during the life of the franchise.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAPE AND APPLE CRUSHER.—August David, S. F. No. 358,597. Dated March 1, 1887. This fruit-crushing machine consists in the peculiarly constructed rotatory cylinder operating in conjunction with the spring-mounted resisting platform, and having adjustable pins, teeth or knives for directing the material to be crushed.

BALE-TIE.—A. S. Hallidie, S. F. No. 358,608. Dated March 1, 1887. This device is intended for securing bales or bundles. It consists of a wire having a loop formed at one end, and having the other end folded upon itself, being twisted and provided with a hook, which passes around the twisted part of the tie, after being passed through the loop of the opposite end. The peculiar arrangement prevents slipping at the point of engagement with the loop.

WASH-BOILER.—Gottfried Bergenheim, S. F. No. 358,589. Dated March 1, 1887. This is one of that class of wash-boilers in which a circulation of the water is provided for by vertically arranged passages or tubes, and in which a false bottom and a clothes-holder are employed. It consists in the improved and novel clothes-holder and in the means for readily and effectively adjusting and securing said holder and the false bottom in the casing of the boiler. The object is to provide simple and effective means for holding the parts in their places in the casing.

HEADER.—Chas. M. Slayback and Wm. H. Slayback, Folsom, Sacramento Co. No. 358,630. Dated March 1, 1887. The invention relates to certain improvements in apparatus for heading or cutting grain preparatory to its being thrashed and cleaned. The patent covers a number of details of construction. The gearing in the center of the machine, driven from both driving wheels, counteracts all side draft, and also balances the weight of the elevator spout, preventing sagging, which causes a side weight on the machine. It also insures the equal distribution of weight and draft, doing away with a great number of gears, pinions, pulleys and bearings, and forms a combination which for durability, convenience, light draft and adaptability to all conditions of grain and unevenness of ground, is, the inventors believe, unexcelled in harvesting machinery.

EL DORADO MINES.—An old miner writes the *Piscerville Democrat* as follows: I have been mining for the last 40 years, almost all the time, and when not at work I am looking around the mining camps learning what I can. I have been in Montana, Idaho, Washington Territory, Oregon and Utah, and all over California, and the mines and climate of California, and especially of El Dorado county, I find the best that I have yet seen. I can count some eight or ten quartz mines in this part of the county lying idle for want of capital to open them.

THE San Luis Obispo Republic says: The La Panza and other gold mines in the eastern part of the county are yielding large quantities of gold since the recent rains. This gold-bearing region extends over a large area, embracing the headwaters of the Salinas and San Juan rivers, much being on Government land, and offers very favorable opportunities for non-capitalists to engage in mining. From \$2 to \$5 a day is made by miners.

At Jenkin Richards' coal mine two veins of coal have been tapped—one six feet, the other seven feet wide. The mine is seven miles from Livermore, and work will be prosecuted when the weather settles. The coal is of better quality than the Mount Diablo. The Livermore Oil Company is actively engaged in boring a well, with favorable indications.

JAS. SAVAAGE and son, while mining near Rogue river a few days ago, caught a large wildcat in their hydraulic pipe. All at once the giant refused to throw a stream of water, notwithstanding they had 150 feet pressure. The water was turned off and a huge wildcat was found inside the pipe.—*Jacksonville (Or.) Sentinel*.

The Western Union Co. has laid its new cable between Port Costa and Benicia. With the exception of a short distance on the Rocky mountains, this cable completes the copper wire constructed between San Francisco and Chicago by the Western Union. The new wire will be worked by the Wheatstone automatic system.

The Chinese who are working placer mines along Gold canyon between Silver City and Dayton now have a good head of water for sluicing. Although they say it is "two pan, one color," the Celestials are undoubtedly making very good wages. They occasionally strike spots of new ground that are very rich.

The plan of the Commissioner of the General Land Office to consolidate the offices of Surveyor-General has failed, and with it the control of all public surveys from the Land Office in Washington. It was proposed to consolidate the offices of Surveyors-General of California and Nevada, and abolish them in 1891.

GOOD HEALTH.

Medical Ethics.

"Seize on the truth, where'er 'tis found,
On Christian or on Heathen ground;
Among its friends, among its foes,
The plant's divine where'er it grows."

Ordinary politeness and justice, and a proper consideration for every man's claims, is the true medical ethical law. Men who earnestly, honestly, conscientiously and religiously seek knowledge do not inquire from what fountains it proceeds; their only question is: Are we recolving the truth? Earnest Christians do not heed whether their Lord was born in a stable or a palace, whether He was found in His infancy on a perfumed, downy bed, or whether in the trough of a stable, lying upon refuse straw; their anxious question, and the only one pertinent to the truth, is: Is He the Son of God? Is He the Christ? Is He the Redeemer of the world?

In a most interesting work, entitled "The Science of Life," by the Rev. J. H. Wythe, A. M., M. D., on page 11, we find the truly thoughtful remark of an inquiring mind: "Truth, which should be the object of all study, is not aided by epithets or personal acrimony." Those who obstruct progress have ere now been compared to Dame Partington, with her mop, trying to push back the Atlantic. What is the object, primarily, of all who pursue the calling of medicine? Is it not, by all and every available means, to ward off disease, heal disease and give relief in hopeless disease, thus to benefit and prolong human life in all its physical, intellectual and moral relations? On every side we see rapid intellectual progress, every encouragement given to scientific inquiry, less theory and more solid work—a thousand-fold more workers with a thousand-fold more resources, their watchword, "onward."

A popular treatise on medicine of the present day contains more information, precisely and practically given, than was at the command of many medical men 50 years ago. And each year, even as the Pyramids of Egypt rose from their broad and solid base to tapering apex, so the mass of human knowledge is becoming a nobler and better structure, making truth the crowning point, from which we have a still more extended vision. Individually and collectively, it is every man's duty and privilege so to ply his lifework that it may not only benefit himself and family, but likewise that largest of families—the human race. Individuals do not all arrive at special knowledge by the same road. Ability, propensity, opportunity, have such immeasurably powerful influences over professional life that for one man to say to another, "You cannot stand where I do, inasmuch as you have reached your conclusion by a different way," is foolish and defenseless.

On the many charts of sea captains who have entered the noble harbor of San Francisco, is the course of any one vessel identical in its tracings with that of another? The course of a ship is not more variable than that of human life, the experience of all utilized by the several, that of the several by all.

No monopoly can be made of medicine. When satisfactory results are professed to have been obtained by any practitioner, or any person, there can be no law appealed to for the purpose of obstructing investigation and excluding evidence. The San Francisco Medical Society did little to advance its claims to be a scientific body, when it scornfully refused, on invitation, to investigate 40 or 50 cases of cancer which it was claimed in the most positive and defiant manner had been cured. The truth should have been brought home, or quackery unearthed, in consideration of common responsibility and common dignity. A flimsy pretext of "medical ethics" can never serve as an apology among men of scientific temper for self-complacent ignorance; no shackles are sufficiently strong to prevent investigation. If a golden grain of truth be discovered, they are glad to exclaim "Eureka!" If falsehood, quackery, deception and ignorance are developed, the true medical profession honors and vindicates itself, and in every way the public is protected. Among the great philosophical medical inquirers of the world, the sole questions are: What is the matter? What will best cure, or relieve, the difficulty? This is the only haven of rest.

Water vs. Whisky.

EDITORS PRESS:—Water is the natural drink for man, and may always be taken in moderation when thirst is present. It performs important purposes in the animal economy, and is absolutely indispensable to life and health. Water is the only fluid which does not possess irritating, or at least stimulating, qualities, and in proportion as we rise from table beer to ardent spirits, in the same ratio we educate the stomach and bowels for that state of morbid sensibility which must eventually weaken the digestive organs in such a manner that they cannot perform their respective functions, and indigestion and dyspepsia is the consequence. If we would enjoy health, all stimulants should be avoided as common drinks. They may be useful as medicines, when nature falters and droops and cannot resuscitate herself; but as a beverage, stimulating drinks should be avoided. When stimulants are taken, the machinery of the system is hurried and driven too fast, and although by this means its activity and power

may seem to be increased, yet a reaction must follow, and a corresponding debility must ensue, then another stimulating draught is called for to bring the system up again, when another reaction must follow. By this course the natural vigor of the constitution becomes gradually and oftentimes imperceptibly impaired. Hence, if we would preserve a healthy system instead of provoking nature to unnatural action, we must furnish her with sufficient healthy nourishment, and let her regulate her own mode and speed of action. Give her nourishment and she will furnish her own stimulants, which will be far preferable to any promptings which art can invent, sustain her in her natural action, and not force her to unnatural speed, which is weakening to her innate powers. To live naturally is to live healthily; to live artificially, is to tempt and foster disease. By stimulating, the nerves are excited, and, in due time, become so irritated as to set up an habitual state of morbid sensibility. From too frequent potations of spirituous liquors the appetite and powers of digestion are extinguished and the stomach irritated in proportion as the inebriate takes his libation the more frequent, till even the presence of food cannot be borne without pain, and a very small quantity of the burning fluid which he used to swallow so freely and with so much gusto, now quickly makes him inebriated. These are facts, and facts are stubborn truths which we see every day, and whoever has watched the dram-drinker's progress will bear me out and support the position I have taken. The too frequent use of ardent spirits stupefies the mind, blunts the mental faculties, weakens the nervous system, destroys our finer feelings, and makes us less sensitive. Injuring our appetite, it makes us irritable, lowers us in the estimation of our friends; we lose our self-respect; it reddens the eyes, it bloats the face, it saps the foundation of health, it weakens our physical strength, it cools the ardor of our attachments, it alienates our affections, and lastly it tumbles us into the ditch, and degrades us below the brute creation.

I find by the reports made to the authorities, in many cities, that there is a wonderful increase in an important branch of manufacturing. In these factories are made a great variety of articles for several classes of society, from the genteel dandy tippler to the beastly drunkard, from the brainless stripling, with his first cigar and julep, to the aged veteran, in filth and rum. Here the green puppy (pardon the expression) is prepared to squander his father's frugal earnings; here are made broken hearts of wives and daughters; here are ruined the hopes of fathers and the stay of mothers; here are prepared men for the prison and the gallows; here is donned our taxation, and our homes are filled with poverty and shame; here votes are manufactured for demagogues to buy; here are made gamblers, thieves, rowdies, loafers, idlers, drunkards, vagabonds, grief, despair, suicide, and murder. In those factories are made rags, ignorance, and starvation for our children, shame and sorrow for our friends, and beasts of ourselves. **LESTER CROSS.**

Stockton, Feb., 1887.

USEFUL INFORMATION.

Fuel From Cornstalks, Grass, Etc.

A citizen of Pocahontas, Ia., has invented a new fuel which bids fair to take the place of coal in the prairie countries. He grinds cornstalks and coarse prairie grass together and moistens them. This pulp is pressed into blocks about 12 inches long and 4 inches thick, and dried. One block will give an hour's steady heat. This fuel can be produced for \$2 a ton, and the inventor claims that it will last twice as long as the best soft coal. Another kind of

An Oil Fuel Block

Is now being made in Philadelphia, which is termed the Standard Fuel Block—a most ingenious method of utilizing oil as fuel. The fuel block is composed of fire-brick and other absorbent materials; is some nine inches long by three wide, weighs four pounds and has absorbent power sufficient to absorb about one-twelfth of a gallon of oil. These blocks are placed in the ordinary combustion chamber of furnaces, ranges, gates, etc., requiring no change in construction. The block retains the oil from a month to six weeks without evaporation. The advantages of the block for burning oil will be apparent at once. It gives a quick, hot fire. The oil is, by its absorption, put in a form that it can be fed into the grates without spraying or any change in the construction of the furnace or in the method of firing. There is no residuum, no ashes, no clinkers, no litter and no danger. It is especially desirable for summer use, and as a fuel for house-roofers and outdoor heating purposes it has no equal. It is said to be especially desirable for steam, fire, and stationary engines, on account of the quick, convenient, and intense heat produced.

AN ALLOY which will solder glass, porcelain, and metals, or one to the other, can be made in the following manner: Copper dust made by precipitating the metal from a solution of bluestone by means of zinc, is to be put into a mortar and treated with a strong sulphuric acid. To this mass formed by the copper and acid, is added a little more than twice as much mercury, the addition being made with constant stirring. The amalgam thus formed is washed

with warm water to remove the acid, and is afterward cooled. When required for use it is heated, and worked in a mortar until it becomes as soft as wax, and in this state it will cling tenaciously to any surface to which it may be applied. It is applicable more especially to those substances which will not bear a high temperature.

CANINE SCENT.—Careful experiments on the sense of smell in dogs have been made by Geo. J. Romans, who has communicated the results to the Linnean Society, of London. He finds that not only the feet but the whole body of a man exhales a peculiar or individual odor which a dog can recognize as that of his master amid a crowd of other persons; that the individual quality of this odor can be recognized at great distances to windward, or in calm weather at great distances in any direction; and that even powerful perfumes may not overcome this odor. Yet a single sheet of brown paper, when stepped upon instead of the ground and afterward removed, was sufficient to prevent Mr. Romanes' dog from following his trail.

A PERENNIAL WONDER.—From time to time are reported supposed extraordinary and unparalleled cases of change in the color of the human skin—whites turning black and blacks turning white—and it may be worth noticing that this striking affection is by no means a new or very rare one. The disease is called leucoderma, and it is well known among whites, though apparently more frequent in the dark-skinned races. Erasmus Wilson gave its frequency in London as not less than one in 400 cases of skin disease; and, according to Kaposi, it is in Vienna one in 500; but Garden, in India, met with one in 362 cases of skin disease, and Bombay inquiries into leprosy disclosed a great number of these cases.

A DIAMOND TEST.—If you doubt your diamond, do not either try to burn it or to break it. You may test it with black mastic, to which, if it be real, it will adhere closely. You may even, if your ears be sharp, rub two together, and mark the indescribable grating, creaking sound—*le bruit strident*—they give out; so do the officers of the Junta Diamantina in the Brazils with the doubtful stones; and lastly, you may try its refractive power, for, unlike all other crystals, the diamond has no double refraction—that is to say, objects looked at through the diamond remain objects still, and are not doubled.—*Cornhill Magazine*.

SALT FROM SALT LAKE.—A member of the Utah Geological Survey says Salt Lake will be of great value in the near future, not only on account of the common salt it will produce, but also for the sodium sulphate it contains. The latter is separated in a flocculent precipitate by the cold weather of midwinter, and annually thrown up on the shore in enormous quantities. There are many other lakes in the far West, whence an inexhaustible supply of the alkalies may be obtained at a small cost. Mono lake, Cal., alone being estimated to hold over 78,000,000 tons of sodium carbonate.

BEER MORE DANGEROUS THAN WHISKY.—That is the verdict of the *Scientific American*, which sets forth that the use of beer is found to produce a species of degeneration of all the organs; profound and fatty deposits, diminished circulation, condition of congestion and perversion of functional activities, local inflammations of both the liver and kidneys are constantly present. A slight injury, a severe cold, or a shock of the body or mind, will commonly provoke acute disease, ending fatally in a beer-drinker.

A NOVEL STOVE.—Mr. John Brierly, Newark, Ohio, has patented an open fireplace heater and stove. It is said to be the first combination of the kind. Any kind of fuel can be used in it. The principle is the bringing of cold air from outdoors by a conducting pipe under the floor, and which is circulated between the body of the stove and the outside jacket. After this the air is taken through the two sides of the stove in another pipe which passes through the fire-chamber of the stove and through the top into the room.

OSOKERITE AND NATURAL GAS IN EGYPT.—A Cairo telegram states that at the petroleum boring No. 1 at Jemshah, the workmen found, at a depth of 365 feet, ozokerite, a mineral wax, much more valuable than petroleum. Now, at 380 feet, they have reached a close-grained coral. Gas and oil are becoming more plentiful. In No. 2 boring at Jemshah, slight traces of gas and oil have been found. In No. 3, at a depth of 155 feet, a coral clay has been reached. In the boring at Zeiti, at a depth of 400 feet, hard coral was touched.

SOFT SOAP with half its weight in pearlsh, one ounce of mixture in about one gallon of boiling water, is in every-day use in most engineers' shops in the drip pans used for turning long articles bright in wrought iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days till wanted, and retain their polish.

FLEXIBLE GLASS.—Paper of proper thickness is rendered transparent by soaking in copal varnish. When dry, it is polished, rubbed with pumice stone, and a layer of soluble glass is applied and rubbed with salt. It is stated that the surface is as perfect as glass.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MISCELLANEOUS.—Amador Ledger, March 12: Messrs. A. H. Rose and Poudstone talk of soon starting work on the Rose mine, south of the Mechanics, about a mile east of Sutter creek. The Plymouth Consolidated Mining Co., of California, paid March 5th, dividend No. 45, of 25 cents a share, or \$25,000, making \$75,000 paid this year, and \$1,925,000 paid to date. A cleanup was made recently at M. M. Culbert's mill on Rancheria creek, near Quartz mountain. The yield did not come up to expectations. It is still ruoning, however, with the owners doing oearly all the work. V. P. Yelmini has been engaged for a year past to working the dump pile at the Oneida mine. He keeps 10 stamps running, crushing from 10 to 12 tons per day. The yield is small, but it pays something over expenses. There is still a large quantity to be worked.

PLYMOUTH.—The machinery is being placed for the additional 40 stamps to the Pacific mill. Most of the carpenters have been discharged. The Cupps mine is said to be looking remarkably well.

VALPARAISO.—Ledger, March 2: Some exceedingly rich rock was taken out of this mine on Thursday of last week. Samples show free gold in abundance. It is the same character of black metal which has been met with in the Mammoth big tunnel and other properties at Middle Bar. It is by far the richest ore that has been extracted from the Valparaiso, and is considered by many to be the most important minig development yet made in this champion pocket district of the county. Its importance will be readily understood from the following facts: The Valparaiso joins the Mammoth on the north. The upper tunnel of the latter mine has been run close up to the northern boundary line, and it was at the end of this tunnel where the heaviest deposit of gold-bearing metal was encountered. The tunnel of the Valparaiso was started at a point over 1000 feet from the south boundary of the claim. After running south for 500 feet it first came in contact with the vein matter identical with the seam met with in the Mammoth. This ore vein lies between the granite and slate, and the tunnel has been pushed ahead, all the time following the course of the granite, leaving the golden seam untouched, except occasionally breaking into it to ascertain whether it maintained its size and quality. Since first striking ore, the tunnel has been extended over 200 feet, the ore not only continuing all the way, but also showing steady improvement. There still remains a stretch of fully 500 feet between the end of the Valparaiso tunnel to the dividing line of the Mammoth and Valparaiso ground, and inasmuch as the rich seam is known to exist at the end of each tunnel, it is a reasonable assumption that it extends through the intervening unexplored ground. From this standpoint the Valparaiso promises to be the most valuable mine in that vicinity. The workmen are running the tunnel under agreement for a certain interest in the property. They are not running it for the purpose of extracting gold; their contract requires them to carry the tunnel to the north line of the Mammoth. When this is done, we look for some extraordinary finds of gold.

Calaveras.

THE CONCENTRATOR GRAVEL MINE.—Calaveras Chronicle, March 12: The mill on the Concentrator gravel mine was started up the first of the week. Extensive prospecting operations have been carried on in this mine, resulting in the discovery of a valuable piece of mining property. It had been worked in early times and paid handsomely, but as the work extended into the hill a mistaken idea prevailed regarding the course of the channel. The result was that the parties got off the lead and finally abandoned the claim. Four or five years ago the old works were again opened by parties, among them the present superintendent, Mr. C. M. Burleson. Explorations were then continued for a time and again abandoned. However, Mr. Burleson still clung to the belief that an extensive adit and payoff deposit existed and could be found. Acting under that firm opinion, other parties were induced to take hold of the property, and about eight months ago work was resumed and with gratifying results. There are two distinct leads or deposits; the lower is composed of what is known as "blue gravel," and the gravel of the upper deposit is of a whitish character. The main tunnel on the blue lead extends a distance of 1000 feet through gravel. Nine hundred feet from the entrance a crosscut was run on each side of the main tunnel which proved the channel to be at least 200 feet in width, and averaging 5½ feet in height of pay gravel. The upper deposit is about 90 feet above the lower, and upon this lead a tunnel of 500 feet in length has been run. This stratum is fully 350 feet in width, the gravel paying from the bedrock to a height of 12 to 15 feet. Both tunnels will be worked at the same time. A chute will be constructed from the mouth of the upper tunnel to that of the lower, where the gravel will dump into a car and be taken to the mill. A fine 10-stamp mill has just been completed and started crushing gravel. It is without question one of the best put-up gravel mills in the country. The framework could not be improved for solidity and finish. The mill has ten stamps of 750 pounds each, which are fed by two Hendy Challenge feeders, and all the latest and best improvements to mill machinery for that character of work was obtained. There is a gravel bin with a double set of grizzlies, and capacity of 150 tons. Twenty inches of water propel a Donnelly six-foot hurdygurdy wheel under a pressure of 250 feet. There is quite a large reservoir on the hill above the claim which is kept full from the Mokelumne and Campo Seco Water Co.'s canal for mill purposes.

WEST POINT.—Cor. Calaveras Chronicle, March 12: This locality, which has so long been neglected, is now looming up into quite a lively camp, and its future promises an excellent gold-producing record, as the present bonanzas show an increase instead of diminution. For many years previous to the present boom this district was condemned by outsiders to a degree that retarded the development of our mineral resources. Failures have resulted from

worthless seams having been prospected to the utter neglect of the valuable mines that are found here, of which two are now being worked and paying dividends, and the rest will be worked during the coming summer. It was not till late years that a few of the first-class mines were opened in a systematic manner, and are now proving their great worth and capacity of disbursing dividends to the stockholders. The amount of bullion yield over expenses being taken out of the leading mines here is sufficient evidence to convince the most incredulous mind as to their value. The daily output of ore, the size of ledge in shafts, levels, and stopes, when in favorable condition as may be found now, is a very encouraging outlook for our camp and a prosperous era is the near future is assured.

SMELTER.—There is strong talk being circulated, from a reliable source, that a 20-ton smelter will be erected by the Scorpion Co. during next summer.

Fresno.

HILDRETH NEWS.—Fice Gold Miner, March 11: Through the able management of Bob Brownell, at the Last Chance mill, the working of the ore is a success. Before the concentrators were added to the mill it was supposed that some foreign metal existed that caused most of the fine and part of the coarse gold to run off the plates, preventing the "quick" from amalgamating; but such has been proved to be false. The trouble has been the want of experience and knowledge in milling the ore. The Last Chance mine has been on the market for a year without succeeding to get a buyer at \$30,000. Since the owners started to drive in the lower tunnel to demonstrate the depth of the ledge, which taps the ore body in the upper or No. 1 tunnel 450 feet (No. 1 tunnel showing up ore averaging \$45 per ton, and lots of it), the mine to-day can't be bought for less than \$125,000. During the last six months, James Ryan has been the lucky prospector of this section. Commencing with the late deal on the Comstock lode and the latest event in becoming a one-fourth owner in a quartz ledge found by a tenderfoot, D. J. Hatch took the notion that he could find a mine cropping at the surface; and, sure enough, it has proven true. It is a good prospect, and may, in time, open up and develop into a mine. The ledge is located as an extension of the Jessie Morrow mine, distant about a quarter of a mile north-east of Hildreth. The ledge, including ledge matter between walls, is two feet, that shows plenty of free gold. A shaft is being sunk upon the ledge. The owners are James Ryan, D. J. Hatch, Thomas Keefe and Co., Sullivan, Jos. Carroll and Davis have relocated the Ophir claim with the intention of sinking a shaft upon the surface croppings of an 18-inch ledge, that prospects very well. Robinson & Clark have struck a good body of ore in their intermediate shaft in the lower tunnel, under the table mountain. The prospect is known as the Big Bonanza, and at present the prospect does not belie the name. The people of Hildreth are excited over the late discovery of rich ore in the Hildreth mine. During the last 10 days, the superintendent, W. D. Wallis, has opened up in the second east drift a ledge that contains ore which is beyond calculation, and while taking up the ledge in the east intermediate winze or shaft a two-foot ledge was discovered that is alive with wire gold, and to put it at the lowest calculation, it will mill \$100 per ton, while the sulphurets average \$450 per ton. The ledge in the east drift at the White Rock is improving upon development. The ore seems to hold its own in mineral. The McNally Company made their shipment of bullion of about \$12,000 last Thursday. The ledge is all of the east drifts looks well. The Cascade during the week has been drifted 10 feet further in the tunnel, showing good sulphurets ore. The owners have been opening ground for a new shaft upon the croppings of a ledge lately discovered on the claim. The Rough and Ready mine is producing some good ore, in developing which the percentage of sulphurets increases, being worth \$380 per ton. Wm. Ryan and Ned Poniten's late find has turned out to be a well-defined ledge that carries about 20 cents to the pan in coarse gold. The Zebra is fast developing into the best minig proposition west of Fine Gold river. In its two-foot ledge a streak runs through the ore that is decomposed and very rich, being about eight inches thick and running the entire length of the tunnel. The shaft of the Wilson property will soon be at a depth of 100 feet. At 95 feet the ledge is a little over two feet between the foot and hangings, containing ore, according to arastra returns, that will mill \$50 per ton, with sulphurets that are worth \$450 per ton.

Inyo.

A GOOD CHANCE FOR FORTUNES.—Inyo Independent, March 12: Parties who had never before been up on the Inyo mountains went to the summit east of Independence at the beginning of the week. In the higher regions they everywhere saw abundant evidence of the presence of much silver and lead ores. There need not be any doubt that the Inyo mountains offer as good a field for prospectors as any other region in the world. For a distance of more than 100 miles this range gives plenty of evidence of containing many valuable mines, and at no part need the prospector be more than about ten miles distant from a railroad; at many places there is good evidence of valuable ores with half that distance to the railroad, or even less. All along the mountains there is oow an abundance of rich bunch grass, affording fine feed for animals.

WHITE HILL MINES.—Last Wednesday Dick Whittaker came down from the White Hill. He brought good reports from all the mines up on the hill. Himself and partners are taking out good ore right along from the mine leased from Barnes & Keboe. Dick lately found a new prospect about half a mile distant from the old White Hill mine. He brought samples of the ore to town. The pieces are beautiful cubes of galena ore, carrying about 82 ounces silver per ton and 73 per cent lead. This promises to be as good a claim as any on the hill. Pat Keyes and Pat Downs are very lucky in their claim; they have a fine vein and are taking out good ore right along.

SODA EXTRACTION.—Up till the present time a large force of men and horses has been kept at work at Owens lake, making pools or ground tanks for the evaporation of the lake water. It is said that as many of these tanks are now ready for use as will be wanted for some time, and that the working force will be reduced to what is needed to attend the pumping machinery and keep the tanks filled. An

other experiment is about to be made in evaporating the water. An evaporator the length of a flat car has been set to the lake, and this will be tried in comparison with the ground tanks.

FINE GOLD.—A small ruo of ore was completed at the Maxim mill last Wednesday. The ore was from the Arastra mine and another claim near Chrysopolis. From 28½ tons of ore 27½ ounces of gold was taken; the gold was remarkably fine, being worth 19 dollars per ounce. Total value of the cleanup, \$521; average value of ore per ton, \$18. Part of the lot was very poor ore; so that the part that paid anything was of much greater value than the average.

A GOOD FLUX.—Recently some refuse marble from the Owecos valley marble quarry was shipped to Reno, to be tried as a flux in the furnace at the new reduction works. It was found to answer the purpose admirably, and will doubtless continue to be used in future.

SAN CARLOS.—Hoole & Shaw are going ahead prospecting the San Carlos mine. This is a good mine to prospect; the men are making wages right along. A carload of ore was shipped away this morning; it is of better quality than any before taken out of the mine, and the mine is looking better than ever before.

Nevada.

CENTENNIAL GRAVEL MINE.—Grass Valley Union, March 12: Work will be resumed at the Centennial gravel mine, Washington Township, as soon as the snow goes off. The property is owned at Virginia City, Nev., the company having done a large amount of prospecting, and having now everything in good shape to work the mine systematically. The prospects were excellent last fall when work was suspended for the winter season.

LONE STAR.—Nevada Transcript, March 15: The Jones Brothers & Co., at the Lone Star mine, which lies between the Hussey and Buckeye claims at Willow Valley, have for the past three weeks been running their tunnel on a three-foot ledge. Several crushings were taken out some years ago and paid fairly well in free gold. The indications are that this will prove to be a valuable property when thoroughly developed. S. N. Stranahan is steadily pushing ahead the tunnel from Selby Flat that is intended to tap the continuation of the gravel channel on which are situated the famous old Live Oak and Nebraska claims. With good luck he expects to strike the deposit before many more months have elapsed.

Placer.

IOWA HILL.—Placer Argus, March 16: It is reported that the Morning Star mine near Iowa Hill is yielding some very rich gravel. Elliot West now has charge of the practical work of the mine, though Mr. Pascoe continues to exercise a general supervision and continues to act also as secretary of the company. Hydraulic mining seems to be dead, but the drift mines are still working. Hard rock has been struck on the McIntire mine. The Sucker Flat mine, which was sold to the Goldeo River Co. a year or two ago, is only keeping the water out of the works. The Morning Star is steadily increasing the working force.

San Bernardino.

A NEW SIXTY-STAMP MILL.—Calico Print, March 12: The Oro Grande Mining Co. commenced the erection of a 60-stamp quartz mill near their present 15-stamp mill near Daggett. It will cost \$250,000, and it will take six months to complete it. Thirty men are employed in grading the foundation. There is enough ore on the dumps of the Waterloo mine to keep 30 stamps in operation for months, and the remaining 45 stamps of the two mills will be utilized in reducing ore from the King, Burning Moscow and other mines of the company. When the mill is completed and more men put to work in the mines, Calico will again experience the lively times of several years ago. Wilson Waddingham, of the Bonanza King Co., of Providence, is one of the stockholders in the scheme to put up a smelter at San Diego, so it is reported.

Shasta.

NOTES.—Redding Free Press, March 12: Mr. Riley, who purchased the Central mine for \$35,000, is having 40 tons of ore worked by C. E. De Forest. The rock purchased from Bell, Hopping & Co. is, we understand, very rich. The sulphurets from Iron mountain are being shipped to Denver, Colorado. Two more roasters are to be added, which will increase the capacity to 15 tons every 24 hours. Geo. H. Chick went to San Francisco last Sunday, to superintend the shipping of the new machinery required for increasing the capacity of the new reduction works, the last piece of which is now on the way. He returned on Thursday. Luke McDonald escorted several mining capitalists up from San Francisco last week, and French Gulch and Deadwood claimed their attention for a few days; he returned with them last Sunday, accompanied by Henry Martin, of the Brown Bear Company. Report says that the McDonald brothers value their mine at \$400,000, and they are not hunting a buyer at that.

Sierra.

ALASKA.—North San Juan Times, March 11: News comes from Pike City to the effect that the Alaska mine is turning out rock that pays \$100 to the ton, and that there are hundreds of tons of such rock in sight. It is now said that the Alaska Company would like to be released from their bond.

Siskiyou.

SCOTT BAR.—Yreka Union, March 12: Charles Ingram struck good prospects in his claim last week, finding one "color" weighing 8 ounces and several smaller ones. He is working the old Bueler mine.

PICK AND PAN.—Something like 600 tons of good ore from the Black Bear mine has been hauled to the company's mill. Crushing will commence in two weeks if the weather will permit. Prospectors will do well to devote their energies toward unearthing lodes, as most of the placer ground has been pretty thoroughly prospected. Veio mining will be the future industry of the county. The mines on McAdams creek are all shut down on account of the snow and cold weather, but it will not be long until active operations will be resumed in this extensive and rich mining region. At Oro Fino work was to have commenced this week in the rich hydraulic mines owned by Wright & Fletcher and the brothers

Eastlick. These are among the largest and best paying mines in the county. The hydraulic mines at Hawkinsville were started up last week. The Big Ditch furnishes an unusually large quantity of water, and the season will probably extend a month longer than last year, when these same claims were worked with profit. The never-failing Montezuma mine, on the south fork of Scott river, just above Callahan, is to be worked on an extensive scale again this season. J. B. Parker will superintend the work. We hear that the Fortune will be run this season, but very little work will be done on the Last Chance. Wing-dam mining on the Klamath river will be set back several weeks later this season than usual on account of heavy snow at the head of its tributaries. The body of water will not reach the low-water mark for some time to come. The miners will improve their time now by getting out material for dams. It is estimated that over \$75,000 will be taken from Hon. R. H. Campbell's Quartz Valley mine this season. This property yielded over \$40,000 last year under very unfavorable circumstances. With the surety of an abundance of water this season, and considering the richness of the ground to be worked, we believe the estimate to be too low. In regions where the snow has disappeared, considerable prospecting is being performed. Cabins on the mountains and in the gulches, which have been vacant for years, are now occupied by strange prospectors who have reached here since railroad communication has been established. Several experts arrived from below last month, but departed again with the intention of returning when the snow disappeared. Good reports come from the mines in the vicinity of Scott Bar. A. Milne is working his old mine on Graveyard Hill with success. The Quartz Hill Co. is running two giants and expects big pay. Walter Borland and Henry Preckel are working their respective claims and will do well this season. No new developments in quartz.

Tuolumne.

GOLD.—Cor. Tuolumne Independent, March 12: Gold is being found all along the line of this fissure. North and south there are parties vigorously prospecting—sinking and tunneling. It is expected that there will be shortly other bonanzas on this line of veins. I heard of a strike having been made in the past few days, south, in Rollierie's ground. I will give a statement next week. I hear there are several parties on Austrian Hill (Bald Mountain) taking out heavy gold. The old Kaiser struck about \$12,000 last week. It is rumored that they have taken out 25 pounds since. This mine will, in the near future, produce largely—as the owners will hydraulic off the vein (it being shattered by a slide), water being readily available. The result is a foregone conclusion, as it is a well-known exceedingly rich vein. If the amount of gold coming out of Tuolumne county could be arrived at, it would show considerably ahead of any other county in the State. The Buchanan mine, at lowest level, is showing splendidly—turning out bullion regularly. From its 20-stamp mill large yields prevail. The Quartz Mountain mine is working with 25 stamps, satisfactorily. The Star G. Mining Co. at Rose creek, under the able superintendency of G. F. McPherson, is being put into good working order. There is a 12-foot vein uncovered, which assays into the hundreds. There are several other veins on this fine property that are exceedingly rich. This is a fine section of the county and will produce a vast amount of gold when the mills are built. The Black Oak mine, Soulsbyville, struck very rich gold last week, showing galena, zinc blende, and coarse and fine gold all mixed together. The vein is from 1 to 2½ feet, and found 150 feet from the surface. The ore is as rich in quality as the ore the old famous Soulsby used to extract in palmy days. The Live Oak, Churchill, and Wheel Perrin mines are on the same lode, and are valuable properties. The Riverside mine has at last struck the "shoot" in the low level tunnel. We hear the rock is of high grade. The San Guiseppe struck rich gold a few days since.

THE BONANZA YIELDS AGAIN.—Union Democrat, March 12: The Bonanza mine at Sonora, like the Mauna Loa volcano of the Sandwich islands, has made another eruption, not of burning lava, but of shining gold to add to the material wealth of the country. This famed mine yielded its hundreds of thousands of dollars of golden wealth a few years since. For a time it lay idle, then work was again prosecuted and a drain tunnel run into it. Once more the express company and the mint have greeted gold in quantity taken from the Bonanza mine of Sonora. The last miners working were A. P. Johnson and David R. Oliver; a few days ago they drove their picks into a pocket and developed from \$50,000 to \$60,000. The mine is owned by James G. Divoll; Oliver and Johnson worked under a lease for a certain share. The yield was divided between Divoll, Johnson, Oliver and John P. Dart, the mining surveyor and engineer. Notwithstanding the mine has yielded so largely, it is the belief of miners that it yet contains untold thousands of wealth. More than 30 years ago it paid various parties what was called big in those early years of quartz mining. It has had its ups and downs, its owners at times getting rich and other owners failing to succeed. As long as the hill remains it will hide gold which can be had only by persistent hunting. There is a large strata of veins running through it, carrying gold oftentimes in very large quantities. The days of the Bonanza have not passed; at some time it will give its riches in as great profusioo as it had in the past.

Trinity.

THE VENICIA MINE.—Journal, March 12: From Mr. St. Auburn, superintendent of the Venicia mine, Eastman district, we learn that work on the new mill is being pushed as rapidly as possible. All of the machinery has been hauled to the mill-site, except one load, and that will be on the ground within a week. The difficulty of procuring lumber at this time of year has been quite a drawback, but Mr. Jumper will get a supply in as soon as it can be transported. Timber is being hewn for the frame of the mill, and its place of location has already been nicely graded. The mill, on its completion, will be able to do considerable custom work and thus will be of great benefit in affording a practical working test of the value of the numerous ledges owned by other parties in its vicinity. In addition to the above, Mr. St. Auburn is also running a tunnel from the east side of the mountain to tap the ledge at a depth of 300 feet. The probable length

of the tunnel will be about 700 feet. Work is being pushed with three shifts, and the mine will soon be well opened and in good running order. On the whole, the outlook is very favorable for a prosperous season in that quarter.

THE BRUNSWICK MINE.—Work has been resumed on the Brunswick mine, Mr. W. F. Arnold having taken charge of the property. This mine is located near some of the most valuable mines in Deadwood district, and indications point to a good ledge.

NEVADA.

Washoe District.

Savage.—*Virginia Enterprise*, March 12: The north drift on the 1200 level, from the Hale and Norcross side, is into Savage ground a distance of 80 feet. The last 20 feet of this drift is in quartz, carrying some good ore. The drift is running nearly parallel with the ore streak, and has not yet much cut into it. In a day or two a west crosscut will be started, the deposit cut across and its width ascertained. The 800-foot station at the Curtis shaft has been completed. Waste rock is now being hoisted up this shaft, but the ore is still hoisted at the Bonner shaft of the Gould and Curry. As soon as the sidetrack from the Virginia & Truckee railroad is completed to the dump of the Curtis shaft, the ore will be hoisted at that point—will no longer be sent out to the Bonner. On the 800 level, they are now driving south from No. 3 west crosscut. The quartz shows some good assays, some spots showing some very good ore.

Iowa.—*Tunnel A*—The face is still in vein matter. The air has become foul and only one shift—at night—is now worked. Have commenced sinking an air shaft from the surface to connect with this tunnel for ventilation. This shaft is started on the middle lode croppings, which prospect well in gold, and will be continued down on the lode to connection with the tunnel. The large ledge discovered on the surface last week is being opened and traced in length at other points and prospects well in all openings. This ledge has been struck in B tunnel fully 25 feet wide, lying on a heavy footwall clay, considerably broken when cut, but all the quartz in the lode gives fair "horn" prospects of gold.

CON. CALIFORNIA AND VIRGINIA.—West crosscut No. 1, on the 1300 level, is out 584 feet. The face still shows low-grade quartz. The usual progress has been made in No. 1 crosscut east on this level. Good headway is making in the work of cutting out the station for No. 1 winze on the 1400 level. This winze is at a point in the main south drift 110 feet south from where it connects with the C. and C. shaft drift. Upraise No. 2 from the south drift still continues in good milling ore. Are still extracting ore from winze No. 2 on the 1405 level, 165 feet south of the Ophir line. The ore-producing sections are yielding the usual amount of good milling ore.

Hale and Norcross.—On the 1200 level a west crosscut is being driven jointly with the Savage near the north line of the Norcross ground. The crosscut is now in about 130 feet, with vein material of a favorable appearance in the face. On the 1200 level a drift is being driven south; also are driving south on the 1300 level. No crosscuts have yet been made from these drifts, but every 100 feet timbers are being put in preparatory to starting crosscuts at 00 distant day. On the fifth station (1100 level) a crosscut is being run to the west, the face of which is now in a mixture of quartz and clay of a promising appearance.

Potosi.—On the 250 level the drift south from the Chollar line is 365 feet in length. Its face is still in a favorable vein formation. Timbers are put in as the drift progresses, from which crosscuts will presently be started. The drifts and other openings in the mine at several points are filled with ore. This ore will probably lie where it is until a new mill is erected here in the city. Work on this new mill will be commenced just as soon as all danger of storms is thought to be over. The mill will work the ore of both Potosi and Chollar.

MEXICAN.—On the 1300 level the joint Union and Mexican drift, which has been turned in a northeasterly direction to follow the trend of the vein, was extended 34 feet; total length, 570 feet. This drift is now 317 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 28 feet; total length, 244 feet.

CHOLLAR.—The old Chollar shaft is being re timbered and sunk to get down to the head of the old incline, 1000 feet below the surface. It is now down about 900 feet. Work has been resumed on the croppings at the Sharon shaft, where some ore is being taken out; though the dumps are now all full of ore.

JUSTICE.—The south drift on the 200 level is still in a streak of ore which will pay for milling, and several tons are saved daily as the drift progresses. The drift from the bottom of the winze 60 feet below the 350 level is being pushed south in a favorable formation, and stringers indicate that it will soon reach the streak of ore found on the level above.

BALTIMORE.—The west drift from the 500 station is in favorable material, which must lie in the vein, as the east clay—or what was supposed to be such—was cut through some days ago. As soon as the 350 level has been cleaned up, the north drift will be pushed ahead to look for the ore body found on the 225 level.

OPHIR.—On the 1300 level the northwest drift from the Consolidated California and Virginia is into Ophir ground 130 feet, and the drift north from the Consolidated California and Virginia is into Ophir ground 80 feet. The face is still in quartz of low grade.

ANDES.—On the 200 level are taking out some very fair ore. As yet the ore occurs in bunches. Some of the bunches are very rich, while others are of low grade. The average, or mixture, is fair milling ore.

BEST AND BELCHER.—On the 1500 level the northeast drift was advanced 106 feet; total length, 836 feet. This drift is passing through porphyry, clay and quartz, showing value by assay.

YELLOW JACKET.—The usual exploring work is being done in the old upper levels. The ore-producing sections are looking good yielding about as usual. The daily shipments to the Brunswick mill,

Carson river, average 150 tons, which is about the daily capacity of the mill.

ALPHA AND ESCHQUER.—The west crosscut on the 120 level is in Alpha ground. It is progressing rapidly with the face in a favorable formation of quartz, clay and porphyry. The north drift in the Eschquer is in much the same kind of vein material.

GOULD AND CURRY.—On the 425 level the south-east drift from the main south drift was advanced 52 feet; total length, 112 feet. It is showing low-grade quartz.

HAYWOOD.—The shipping of ore from this mine (situated west of Silver City) to the Thompson mill at Devil's Gate, was resumed last Wednesday, and the mill will now be kept in constant operation on ore from the mine.

OCCIDENTAL.—The drifts, crosscuts and upraises from the upper and lower tunnels are making the usual progress, with no new developments to note in any part of the mine. The usual amount of ore is being extracted.

SILVER STAR.—This Silver City mine adjoins the Haywood on the south. Drifts are being run north and south from the main shaft at a depth of 100 feet, and are passing into vein material that shows some free gold.

ALTA.—Still pushing the south drift from the bottom of the winze on the 800 level. The drift is in promising material lying near the wall of the vein. At an early day crosscuts will be run from this drift.

CROWN POINT AND BELCHER.—The turbine wheel of the Santiago mill will be completed and the mill running the first of next week, when work will be resumed in these mines with the usual force of men in each.

SIERRA NEVADA.—No. 2 south lateral drift on the 320 level is now in a little over 400 feet. It is in a vein formation carrying stringers of low-grade quartz, with occasional bunches of the same.

OVERMAN.—Six carloads a day of fair ore are still being taken out from the level of the old Petaluma-street tunnel. This is shipped to the Vivian mill for reduction.

SCORPTION.—On the 300 level are drifting east from the shaft. The average progress made in this drift is 35 feet a week. The drift is passing into soft vein material.

UTAH.—The north drift from the main west drift is out 269 feet. The face still continues in vein material.

BULLION.—An encouraging amount of low-grade quartz is still encountered in the east drift on the 200 level.

SUCCESS.—Good headway is making in the work of retimbering the old shaft.

IMPERIAL.—Repairs to main shaft still in progress.

Lone Mountain District.

ORE.—Belmont *Courier*, March 12: Uncle Billy Koch has several tons of ore from his Lone Mountain mines worked at Reno, and the result was 28 ounces in silver per ton—too little to pay for shipping. With a railroad near there to facilitate the bringing in of supplies cheaply, these base metal mines will be a big thing. The ores are heavy in lead, and will pay to smelt near the mines.

Ophir Canyon District.

PROGRESSING.—Belmont *Courier*, March 12: Work is progressing steadily in the Chicago Mining and Reduction Company's mine in Ophir canyon with the most flattering results. The discovery is opening big and shows fine ore.

Tuscarora District.

TORNADO CONSOLIDATED.—*Times-Review*, March 12: Extended west crosscut 10 feet. We have cut into a vein of fine quartz carrying some sulphurets and giving low assays in gold.

BELLE ISLE.—During the week have started a crosscut east from the 250-foot level. Line crosscut, 150-foot level, has been extended 9 feet; no change in the rock.

NORTH BELLE ISLE.—North gangway, 400-foot level, has been extended 18 feet. The rock is very hard. North drift on east vein from No. 1 winze, 70-foot level, has been extended 19 feet. Vein matter in face broken and irregular.

NAVAGO.—Fair progress has been made with the work on the 350-foot level. South drift from line crosscut, 150-foot level, has been extended 8 feet. The ore being extracted from above the 150-foot level is of lower grade than last week.

NEVADA QUEEN.—Crosscut on the 350-foot level has been advanced 21 feet; total distance 117 feet. There is water showing through the seams in the face. Water has raised in the shaft up to the 200-foot station. Shaft has been retimbered up to the 100-foot level, where a station is being cut out. North gangway, 200-foot level, has been extended 14 feet, all of which has to be timbered. Quite a flow of water is coming from this gangway. West drift is in 85 feet, 20 feet being made during the week.

Union District.

WORK COMMENCED.—Belmont *Courier*, March 12: Work has been commenced on the Berlin mine, Berlin canyon, Union mining district. This is one of the series owned by the Cincinnati Company. They are also working on some of their other mines. The Knickerbocker mill will soon be ready to drop stamps.

White Pine District.

PURCELL.—White Pine *News*, March 5: The Purcell mine on White Pine mountain, which is the property of the Sweetwater Co., is said to be looking well, and that a large quantity of smelting ore is in sight, ready to be taken out as soon as they get things in shape to do so. Wm. Matson has three men and himself at work on the Little Giant mine, just over the Shermantown divide, which Mr. Matson says is looking very promising.

ARIZONA.

TURKEY CREEK.—Prescott *Courier*, March 12: We have to thank Hugh Mulvenon for a specimen of ore from Roach & Mulvenon's mine, Turkey Creek district. A carload of the stuff will be sent in here shortly. Mr. M. says the gold ledge that was recently discovered gives promise of great richness. Messrs. Clark & Adams are running a small mill on Groom creek. Runs have, so far, been

successful, and they may, ere long, add more stamps. The U. S. lode and the Howard, near Prescott, contain ore that is rich enough to ship, and owners should be working them.

ORE.—Mohave *Miner*, March 12: Oliver Bros., of the Prosperity mine, Todd Basin, sent over a couple of tons of ore. J. Upsher had a ton of good ore worked from one of his claims on Stockton hill. Sample & Shrope had two lots of ore from the Juno mine sampled during the week. Levy & Co., of Prescott, sent down a carload of ore during the early part of last week. James Wright had a ton of rich ore from a claim at Chloride put through the sampling works. A carload and a half of ore from the Rainbow mine was worked at the sampling works last week. The work of pumping the water out of the Keystone mine, at Mineral park, is going on night and day. Among the receipts of ore during the week, at the sampling works, was a carload shipped by W. N. Kelley, of Prescott. Messrs. Christie & Lawrence sent over 15 tons of ore from the Rural mine, at Mineral park, which went away up in the hundreds as usual. We paid a visit to the sampling works this morning, and found everybody busy sampling seven lots of ore shipped here from Prescott, by Frank Cockburn. J. J. Jerome brought up a couple of tons of ore from the Arnold mine, Cedar district. As this is the first shipment from this mine for some years, we hope it will prove remunerative. Messrs. Hale & Addison have a working bond on the Lone Star mine, at Mineral park, and have already put the hoisting machinery in running order, ready to start up work in earnest on Monday. The branch sampling works now being erected at Prescott, by Foster S. Dennis, will be the most complete affair of the kind in New Mexico and Arizona. Brow & Miller brought in to-day another load of ore, about a ton, from their rich mine in the Weaver district, near El Dorado canyon, and it is safe to say that Mr. Brown will go home to-morrow with a check for \$400 or \$500 in his pocket.

MONTANA.

GOLO.—*Helena Herald*, March 10: John Hardwick, who owns some promising gold quartz leads in the Big Indian district, was displaying some rich specimens from the Bourbon mine in that section, yesterday. They are sprinkled all over with pure gold which is not only visible to the naked eye, but is in such profuse quantities that it could be discerned across the street. John expects some valuable developments in his claims this season.

BULLION.—*Helena Independent*, March 10: Another wave of most excellent good feeling overwhelmed the stockholders of the Jay Gould mine yesterday, and they felt jubilant. The cause was the arrival of two yellow bars at the Montana National bank, comprising the output of the mill for the month of February. The bars were worth a few dollars less than \$17,000, cleaned up from the work of a trifle less than 25 days. Besides this there remains about \$500 of slag in the assay office, and it has taken an amount of bullion estimated at from \$3000 to \$5000 to charge the mill, which amount is not cleaned up but remains in the pans and batteries. As this is the first month the mill has run, succeeding months' outputs will afford a better criterion of the value of the ore and the efficiency of the mill. But \$17,000 of bullion from a 10-stamp mill in 25 days must be regarded as great work.

NOTES.—*Butte Inter-Mountain*, March 9: Clark's Mountain Chief still remains shut down. Dave Upton's Mountain Chief is being actively developed. The West Colusa is working a force of about 20 men, some at the pumps and others prospecting. The Pueblo Sampling and Refining Works are doing considerable business with small mine-owners. The Liquator concentrator has been leased by the Buie Reduction Works and is being run constantly. The Betsy Dahl is being worked by H. C. Dahl. The 200-foot level has been reached and it is stated that some good silver-copper ore has recently been found. This mine is located on the main street of Meaderville. The Matte mine is working a small force, principally developing. About 20 men are employed on the Modoc. It is stated that a large vein of good ore has recently been found in this mine. These two mines are included in the Mountain Consolidated group owned by the Chambers syndicate. Five pumps are kept constantly going on the Colusa. The principal work going on here is developing new levels. About 12 men are working at this mine. The West Colusa and Colusa are the property of the Montana Copper Co., and from a well-informed gentleman we learn that they have a large amount of good copper ore in sight, especially in the Colusa, and that the company is only awaiting sufficient increase in the price of copper, when they will resume operations.

OREGON.

MINING IN BAKER COUNTY.—Bedrock *Democrat*, March 12: The Peabodias Mining Company is operating the extension of the Tom Payne mine with a large force of miners. They have sunk a shaft to the depth of over 70 feet, and a tunnel of over 150 feet is now being run in to tap the shaft. The vein averages over four feet in width, and it is no uncommon thing for large pieces of free gold to be found. The owners of this property are very enthusiastic over their prospects of having a great mine, and intend pushing the work of development as rapidly as possible. If the mine continues showing up satisfactory, a mill will be erected on the property in a few months. The principal owner is Mr. Ed Hardy, of this city. The Tom Payne mine, owned by Hayes, Reynolds & Co. is showing up to be a vast ore body of great richness. On this mine an immense amount of development work has been done, and its owners are now engaged in running tunnels, shafts, etc. All question as to its being a valuable property is settled. The vein is wide, and the ore is exceedingly rich, and of a free-milling nature. The owners of this property are contemplating the erection of a mill, having heretofore worked the ore by arrastra. The Bonanza mine, of Cabot Cove district, will become one of the leading mines of Eastern Oregon. A mill is now in running order on the property. The other many discoveries of this district give promise of rare development. An exodus of miners and prospectors from less promising points to this district is expected in the near future. Placer mining throughout Baker county will soon commence under most favorable auspices. The flow of

water this spring will be equal to every demand. The placers of Mormon Basin and Amelia will soon start up. Messrs. Colt, Beers, Blair and others expect a greater season of mining than for years past. At Auburn, the district where gold was first discovered in Eastern Oregon, in the year 1862, placer mining still continues, though it must be said the richest of the ground is about worked out. Still some of the original locators of the camp who have followed the pursuit of mining for all these 20 odd years, and have been rewarded for their labor by being the possessors of considerable wealth, are loth to believe that there does not yet remain enough of the buried treasure to justify continued labor. Principal among these mine-owners are P. Connor, William Mullen, and Jos. Eyo, who contemplate working their ground from the mouth of French gulch up to the town this season. Also, Charles Duckworth and David Littlefield will soon commence work on French gulch, and their prospects are good for a large yield. The Marysville Mining Co., owner of the great Auburn canal and much valuable placer ground, is now making preparations to commence the season's work at an early day.

QUARTZ AND PLACER.—*Jacksonville Times*, March 11: Quartz miners are getting ready for this season's campaign, having been interfered with by stormy weather. Dean & Huston, of Willow Springs precinct, have piped off a large piece of ground already and are doing quite effective work. J. M. Walsh and others are making preparations to resume quartz mining in Wagner Creek district on a large scale. Miller & Huggins, of Farmer's flat, are running their giant day and night. J. T. Layton, of Applegate, is busily engaged in piping and making excellent progress. Smith & Lynch are making good headway at their placer mines on Wagner creek, having piped off a good-sized piece of ground already. Miners are favored with an abundance of water, with every prospect of its continuance. This will be the best season that they have had for years. The well-known diggings of Saltmarsh & Co., in Sterlingville precinct, are not being worked this season, having recently been purchased by the Sterling Co. Work is going on at the Sterling mine with two pipes and a full head of water. A large amount of snow lies at the head of the ditch and the prospects are favorable for an extended run. The miners of Josephine county are all busily at work, having an abundant supply of water. They will no doubt make a favorable showing—much more so than they have for several years past. The machinery for the Whitman mine, at Pine creek, consists of a 20-stamp mill, 200-horsepower engine, eight Frue vanners, sawmill outfit, wire-rope tramway, incandescent electric light and complete sampling machinery. The entire plant is expected to be in operation by July 1st.

NEW MEXICO.

LEACHING PROCESS.—*Chloride Black Range*, March 10: The Black Range Lixiviation Company is exerting every effort to make its works a complete success, and offers fair and reasonable terms to the miners, and is willing to meet them half-way. Now let the miners step to the front and extend the hand of encouragement. In order to set a schedule price for the purchase of ores, the Black Range Lixiviation Company will make a test run of the ores of the range, which is an excellent idea. A practical test run will show them exactly just the ores they can treat, which will be of great benefit to both the company and the mine-owners. Frank Pitcher, assisted by his brother and Mr. Forrest, is busy taking out a carload of fine ore from the St. Cloud mine, and has already 12 tons of first-class ore, which carries plentifully in free gold, on the dump, besides a considerable quantity of second-class ore. The St. Cloud has never made as good a showing as it does to-day. The recent discovery of high-grade ore on this property adds much to the general appearance and value of the mine. The ledge of the St. Cloud is one of the most prominent in the country and shows mineral everywhere, and sufficient development work has been done to prove that there is an endless body of good grade, free-milling ore within its walls, and with an ore-treating establishment close at hand, it will prove a mammoth producer of the precious metal.

UTAH.

REVIEW.—*Salt Lake Tribune*, March 11: The receipts of ore were extremely light for the week ending March 9th, inclusive, being but \$12,143.06; of bullion, \$75,263.37; of both, \$88,406.43. The week before the total receipts were \$171,290.83, of which \$100,620.74 was bullion and \$30,247.67 was ore. The Ontario shipped no bullion during the week, the mill undergoing cleanup and repairs. It sold ore to the value of \$21,930.03. All goes along well with this magnificent property. The Daly shipped during the week seven bars of bullion, 10,278.77 fine ounces, and sold ore to the value of \$8480.61; a total product for the week of \$8,758.78. The base bullion receipts of the week were to the value of \$17,850; fine bars, \$14,351.66; gold bars, \$4335.50. The Hanauer smelter produced during the week bullion to the value of \$16,854. No word has come from Horn Silver during the week, save of very limited operations, under a cautious veil of secrecy. Ore receipts in this city for the week were \$4500 by Wells, Fargo & Co.; \$2610 of Crescent by McCormick & Co.; and \$5033.06 by T. K. Jones & Co.

SNAKE CREEK NEWS.—The Southern Tier Mining Company, F. W. Hayt, manager, has seven men employed doing development work on their property. All parts of the mine opened by recent developments are looking splendidly. The slopes are looking well, and the time is evidently near at hand when the Southern Tier will be placed to stay on the list of Park City's dividend-paying mines. James H. Bowen went over to his Snake Creek properties to-day to put some more men to work on his claims. He has ore on the dumps of several pieces of his ground, pushing on the Rochester group. However, the force of men is at present small. The recent rich strike in the Silver Age tunnel of the Silas Reed group loses none of its interest as a principal theme for conversation in local mining circles. It is expected that the lively development work to be done, on this group will evolve the coming summer in an excellent ore-shipping record.

JAMES' PATENT RECIPROCATING STAMP MILL

(PATENTED AUG. 16, 1881.)

Weight of Boss and Shoes (1200 pounds) acts on each Shoe separately. It is practically the same as the regular Stamp Mill.

Capacity, 6 Tons in 24 Hours. 4 H. P.

Parties wishing to test the Mill with any ore they may bring, will find one in operation at our works in this city.

PRICES:

Reciprocating Stamp Mill,	\$350 00
Rock Breaker, - - -	100 00
Automatic Ore Feeder, -	50 00
Single Track Ore Car, - -	40 00

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied. At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet. All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco. Certificates as to performance of the Mills, and any information required, furnished on application.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry, super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Glohe Cases, free of cost, by applying to the manufacturers.

SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG
GISTS' GLASSWARE AND SUNDRIES, ETC.
114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scoffers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
Gur Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
C. A. LUCKHARDT, Manager. ESTABLISHED 1889

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.,
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.
C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt,)
Mining Engineers and Metallurgists.

J. KUSTEL. H. KUSTEL.
★ **METALLURGICAL WORKS,**
318 Pine St. (Basement),
Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.
Assaying and Analysis of Ores, Minerals and Waters.
Mines Examined and Reported on.
Practical Instruction given. Treating Ores by improved processes.
G. KUSTEL & CO.,
Mining Engineers and Metallurgists.

O. H. AARON,
ASSAYER AND METALLURGIST,
NOGALES, ARIZONA,
Will attend to business in connection with mines in Sonora or Arizona.

Aluminium, "the Metal of the Future."

The Only Treatise in the English Language.
JUST READY.
Aluminium: Its History, Occurrence, Properties, Metallurgy and Applications, including its Alloys. By Joseph W. Richards, A. C. Chemist and Practical Metallurgist. Member of the Deutsche Chemische Gesellschaft. Illustrated by 16 engravings. 12mo. 346 pages. Price \$2.50, free of postage to any address in the world.
CONTENTS: Part I. History of Aluminium. II. Occurrence of Aluminium in Nature. III. Physical Properties of Aluminium. IV. Chemical Properties of Aluminium. V. Metallurgy of Aluminium. VI. The Manufacture of Sodium. VII. Manufacture of Alumina. VIII. Manufacture of Double Chloride of Aluminium and Sodium. IX. Manufacture of Aluminium at Salindres (Gard). X. Reduction of Aluminium by other Reducing Agents than Sodium. XI. Working of Aluminium. XII. Alloys of Aluminium. Appendix. Addenda. Index.
A circular showing the full table of contents of this volume will be sent free of postage to any one in any part of the world who will furnish us with his address.

359,020.—CONCENTRATOR—C. W. Joy, Atlanta, Idaho.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

New Incorporations.

EVENING STAR M. Co. March 14. Location, Deadmans Flat, Grass Valley district, Nevada Co. (This is the old Seven-Thirty mine.) Capital stock, \$1,250,000. Directors—J. W. Brumagin, E. F. Bean, W. Patterson, George W. Tyler, George Bird, D. B. Lynch, J. P. Desmond.

BULLION, BECK AND CALIFORNIA M. Co. March 14. Location, Tintic district, Utah. Capital stock, \$10,000,000. Directors—George C. Perkins, W. H. Brown, J. A. Fillmore, Cornelius O'Connor and Alex Badlam.

CENTRAL CALIFORNIA LUMBER Co. March 14. Capital stock, \$250,000. Directors—A. J. Turner, J. F. Kennedy, George T. Shaw, A. W. Kennedy and George Lewiston.

GUALALA M. Co. March 12. Location, Mendocino Co. Capital stock, \$100,000. Directors—J. W. Oates, W. H. Barham, John Field, R. W. Warfield and J. C. Cox.

PACIFIC FIRE ASSOCIATION. March 14. Capital stock, \$300,000. Directors—George C. Perkins, Oakland; P. B. Cornwall, Julius Jacobs, A. M. Burns, Aaron A. Adler, S. W. Levy and George Easton.

Mining Share Market.

Mining stocks have not been very active during the past week, and prices have not shown any material advance. All sorts of stories come down from the Comstock, which have more or less temporary effect. There are favorable conditions at the north end and other places along the lode, but nothing substantial of great moment has been developed. The Virginia Enterprise, speaking of Savage, states that on the 800-foot level bunches of good ore are beginning to be found. In ground where ore will not live at all, a big deposit is just as likely to be found as a little bunch the size of a stage-coach. On the 1200 and 1300 levels of the Hale and Norcross there are also in fertile ground. There they have two long south drifts, along which, at every 100 feet, timbers have been put in preparatory to starting crosscuts. It will not be long before two sets of crosscuts will be seen going on in each of these levels. Besides, on the 1100 (fifth station), they now have a west crosscut that is in very promising material that is largely composed of quartz.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bluebird, March 8, \$25,760; Eureka Co., 15, \$8000; Moulton, 9, \$12,800; Alice, 9, \$12,170; Hanauer, 9, \$2700; Crescent, 9, \$2610; Hanauer, 10, \$2700; Hanauer, 13, \$5420; Jay Gould, 10, \$17,000; Margat Ann, 10, \$11,038; Lexington, 10, \$25,000. Last week Wells, Fargo & Co. received at Salt Lake in bullion \$41,037; McCormick & Co., \$19,464; T. R. Jones & Co., \$5033; and Union Bank \$22,872.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MINING SHAREHOLDERS' DIRECTORY.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MICHAEL GREELY, an old-time prospector, died at Garfield on the 4th inst.

New York Metal Market.

Telegraphic advices dated March 17th give the following New York prices:

BAR SILVER—99 1/2 per oz.
COPPER—100 1/2 @ 101.
IRON—No. 1, \$22.00 @ 22.50.
LEAD—\$4.40.
QUICKSILVER—53 @ 54c.

The following is the latest by mail from the "New York Metal Exchange Market Report":
COPPER—Steady, spot closing at \$10.65 @ —. Transferable Notices (Lake) issued at \$10.65 @ —. Transferable Notices (Chili) issued at \$10.65 @ —.
LEAD—Steady at \$4.35 @ 4.55 spot. Transferable Notices issued at \$4.45.
TIN—Firm at \$22.40 @ 22.50. Transferable notices issued at \$22.65.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' values. All prompt delivery. Australian Tin, \$22.70 @ 22.90; Billiton Tin, \$23.10 @ 23.40; Banca Tin, \$25.16 @ 25.50; Baltimore Copper, \$9.70 @ 10.15; Orford Copper, \$10.00 @ 10.25; P. S. Copper, \$10.00 @ 10.25; Foreign Lead, \$4.80 @ 4.85; Foreign Spelter, \$4.80 @ 4.90.
MAKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.00 @ 22.50; No. 2, \$20.00 @ 21.00; Grey Forge, \$17.50 @ 19.00; Hudson River, Grade No. 1, \$21.00 @ 22.00; No. 2, \$20.00 @ 21.00; Grey Forge, \$17.50 @ 19.00; Southern, Grade No. 1, — @ —; No. 2, — @ —; Grey Forge, — @ —.

ASSESSMENT NOTICE.

The Phelps Manufacturing Company.—Location of principal place of business, San Francisco, California. Location of works, San Francisco, Cal.

NOTICE is hereby given, that at a meeting of the Board of Trustees, held on the 12th day of February, 1887, an assessment (No. 1) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 17 Drumm street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 21st day of March, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 6th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
W. H. PHELPS, Secretary.
OFFICE—17 Drumm St., San Francisco, Cal.

DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for this purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postages. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

...BUILDERS OF...
MINING MACHINERY.

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

For COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700 pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft and is CAPABLE OF CARRYING 500 feet of five eighths steel rope. SEND FOR CIRCULAR.

Number 13.

New Dredging Machinery.

We illustrate on this page the new dredger "Ajax," recently built for Mr. Geo. F. Smith, of Stockton, Cal.

It is entirely a Stockton production, and one of which that city will have no cause to be ashamed. The dredger has now been working for two weeks at Wakefield's, and, we are informed, is giving entire satisfaction; having been repeatedly timed to be discharging clay at the rate of 220 cubic yards per hour.

The Ajax is almost a duplicate of the last dredger designed by Mr. Ferris for levee-building on Roberts island, with such modifications and improvements as have suggested themselves in the two years it has been working.

The hull, oval in plan, is 36 feet 10 inches by 60 feet over all; it has 4 solid fore and aft bulkheads, and a well-hole 5x12 feet at one end for the bucket ladder.

The main engine is 10x24, operating by bevel gearing, and a 3½-inch vertical shaft, with a 4-sided upper tumbler with 21-inch sides. This engine works also a gypsy shaft for swinging, and the conveyor that carries the mud ashore. A steam hoist with 6x11 engines raises and lowers the bucket ladder. The buckets, at 4-foot centers, have a struck capacity of 5 cubic feet and are speeded to deliver from 18 to 20 a minute, according to the character of the material being handled. They are of hoiler iron, with a 5-inch steel nosing. The links are of wrought iron, with cast bushings. The lower tumbler is hexagonal, on a 4-inch shaft.

The conveyor, projecting 72 feet from the center of the boat, consists of a 5-ply rubber belt 36 inches wide; running over iron drums at each end, and intermediate iron friction rollers at 3-foot centers. Ratchet and pinion on each side of conveyor ladder give means for taking up the slack of the belt, and adjusting the drums to maintain them parallel.

This conveyor is the important feature of the dredge. It is entirely satisfactory in its working and delivers its material, as nearly as may be, in a dry state upon the levee. It was feared the rubber belt would be short-lived, but a 4-ply belt ran continuously for over two years on the Roberts island dredge before it needed replacing.

The hoiler is of the marine type, 52 inches by 10 feet 6 inches, with 3 inch tubes and 14-inch flues; and burns about 1400 lbs. of steam coal in a day of 12 hours. There are three pumps aboard—a hand forcepump for washing hoiler, a plunger pump for hoiler feed, and an Evans steam pump to throw a jet of water into the delivery hopper when digging in any very tenacious material. All three are connected with the hoiler.

Water tanks below deck serve to trim the boat and furnish a supply for the hoiler. The dredger cuts by swinging on a center spud 16 inches in diameter, and moves forward from 8 to 10 feet at each fleet.

The Roberts island dredger, of which the Ajax is an improved copy, handles steadily 700 yards per day of 12 hours, in the stiffest and most tenacious clay in which it has been worked; and ranges from that average to 1500 yards per day in soft peaty mud.

The Ajax was built by contract by Farrington, Hyatt & Co., of the Stockton Iron Works; their bid having been very considerably below that of a San Francisco firm with whom they were in competition; a fact that certainly pays

handsome tribute to the facilities of Stockton manufactories. The hull and framing were built by D. Jarvis, who has succeeded the late S. H. Davis, as proprietor of the Stockton Shipyard.

This type of dredger can be built for about

MINING WORKS DAMAGED.—On Wednesday morning the buildings of the Bald Mountain Extension Company, at the mouth of their tunnel in Forest City, were burned, the fire starting from some overheated tar on a stove in the old office. A portion of the spiling and some

WATER-JACKET COPPER FURNACE.

\$12,500, and we are informed can be relied on for a monthly average of 26,000 yards in any material met with in the overflowed lands near

of the breasting caps, with the blacksmith and carpenter tools, were destroyed. The tunnel timbers were saved. Thirty men working over

THE Dominion Government has decided to send to British Columbia a party to make geological surveys. The Government hopes, with the co-operation of the United States, to establish the boundary lines between the two Governments.

IMPORTANT discoveries of gold are reported from Alexander City, Ala.

Water-Jacket Copper Furnaces.

The water-jacket furnace is now generally employed in this country for the melting of oxidized and other copper ores. The engraving on this page shows the general form of the furnace, and by means of the letters in the cut, the operation is readily explained. The furnaces consist simply of a casing with an outer and inner shell of iron, between which water freely circulates. Some 25 or 30 gallons of water per minute are required for this purpose. The inlet of the water is through the pipes, *F*; the outlet is through *G*. Hand-holes in the bottom of this space are arranged to permit ready access for cleaning. A great deal of the water in the mining regions contains lime, and the water space of the water-jacket scales almost as rapidly as a boiler, thus making these hand-holes imperative. The blast through *Z* is carried around the furnace in the circular casing, *G*, and enters through the tuyeres. Opposite each tuyere is a hand-hole (and an eye-hole) in this casing, which permits ready access to the interior of the furnace.

The outer shell of the furnace is continued down some distance below the water-jacket, and there forms the casing of the crucible. The interior of the crucible is lined with fire-brick and clay. This clay bottom of the crucible rests on the hinged iron doors, *P*, which can be dropped at any moment, when the furnace is blown out, to remove accretions in the furnace or for any other purpose.

The slag lip *L*, attached to the furnace, carries off the cinder. The tapping notch, *O*, is used for tapping the metal produced. The whole furnace stands on four pillars, *R*, and is covered by the hand *H* leading to the stack *K*. The hand *H* has a charging door out in it. The level of the charge is usually kept about a foot below this charging door.

A furnace of this class, 42 inches in diameter at the tuyeres and 9 feet high, driven by a No. 4½ Baker blower, run 100 to 120 revolutions, will readily smelt 40 tons of ore per day. With increased blast an average of 50 tons has been smelted in these furnaces, and even 60 tons have been put through them. Mr. Arthur Wendt, in his paper on the "Copper Ores of the Southwest," before the American Institute of Mining Engineers, says the experience at Globe and elsewhere has proved that a forced rate of smelting leads to an increased loss of copper in the slag, and is not economical. Excellent smelting is done in these furnaces. The charging is done like that of an iron furnace, in horizontal layers, charges of coke, ore, and the necessary fluxes alternating in regular order. The coke mainly used for fuel on this coast is what is known as patent English coke from Cardiff, Wales.

THE Arizona Citizen says: Mining matters at the Quijotas are looking up, sud, while there is no semblance of a boom, a great deal of activity exists, and the fact is being better demonstrated daily that this is one of the coming great mining camps of the Territory.

THE debris suit brought by Stockton against the hydraulic miners was decided for the defendants Saturday, on the ground that the natural wash and the plowing of the ground is responsible for the debris to an excessively large extent.

THE newly discovered petroleum fields of San Benito county are being carefully examined,

SENATOR TABOR, of Colorado, has purchased for \$265,000 the well-known Vulture mine, with its mill, mill-site, etc. The new superintendent is Cyrus Drihble. This is one of the oldest of the Arizona mines.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Petrification of Ores.

EDITORS PRESS:—In the issue of your paper of January 22, 1887, there appears an account of a "petrified forest" near Calistoga. I have personal knowledge of two other cases similar to that which is described, one being in Oregon and the other in Texas. In your article you seem to attribute the phenomenon which you describe to volcanic action. Those of which I have knowledge certainly could not have been produced in that manner. The valley of Richland Creek, a small feeder of the Trinity river, in Texas, is chiefly very rich prairie soil, but there are intervening narrow strips of barren, sandy soil which have on them a scattering growth of scrubby oak and hickory trees. Interspersed everywhere among those living trees there are, lying entirely on the surface of loose level sand, petrified trunks with the larger branches spread in a natural position of trees unmistakably of the same variety as those still standing alive around them. They are always broken squarely across into short sections, sometimes being split evenly into thin pieces resembling short wooden pickets. There cannot possibly have been any volcanic eruption within hundreds of miles of that valley since its formation. Near the town of Dalles, in Oregon, there are petrified stumps of yellow pine trees yet standing in place where they grew in stony soil, with the same variety of trees now growing in the immediate vicinity. When a boy I had knowledge of a single petrified tree trunk lying on the surface of alluvial soil, the trunk appearing to be of sycamore, a variety of timber growing abundantly nearby. That place is certainly very remote from the seat of any recent volcanic agency. Without having seen the Calistoga trees, I conclude, from observation elsewhere, that you are at fault with regard to the theory of the manner in which they were produced.

JUSTIN CHENOWETH.

Tuolumne County Notes.

EDITORS PRESS:—A visit to the Patterson mine, at Tuttle town, discloses a fine property. It was reported about two years ago that the mine could not be made to pay, that there was no more rock ore. Mr. Morris, the present superintendent, after an examination, reported to the owner, Mr. Prince, of Boston, that there was plenty of rock, and after repairing the old machinery, started up, and has been hard at work ever since, crushing ore, of which there is sufficient in sight to keep 40 stamps busy. It is contemplated to increase to that number this summer. The total force employed to extract 50 tons a day is 18. The ore is of a highly sulphureted character, and it is owing to this fact that the gold is difficult to save.

Mr. Morris is a practical miner, and it is due entirely to his earnest efforts that the mine has been made a paying one.

The Divoll Bonanza, at Sonora, has again startled the community; another rich pocket found, to the tune of \$65,000. This mine has proven wonderfully rich, and the owners are confident it is not half worked out. The water has just been let in to the ditches, and mining men are hard at work on their claims, with bright anticipations for the summer.

THE LICK TELESCOPE.—Captain Thomas E. Fraser, the superintendent in charge of construction at Mount Hamilton Observatory, in the course of conversation with a reporter, said that the work at the observatory is progressing finely. "But I am afraid," he continued, "that the placing of the big telescope will be somewhat delayed. It was agreed that the instrument should be in place for inspection by the 1st of April, but late advice from Cleveland, Ohio, state that the work on the pedestal and substructure is still in progress, and I do not think that we will have it in position until some time in September next. Captain Floyd will go on to inspect it when it is completed, but thus far has received no notification to make ready for his departure. The pedestal or base will be one solid piece of steel, and the entire weight of the substructure will be 28 tons." Captain Fraser also said that in consequence of the death of the noted mechanician Fields, which lately occurred in London, the contract which had been let to him for making the third photographic lens—a most intricate piece of work—would probably be changed. The dome, it is expected, will be placed in position in about three weeks. The work thus far has been most satisfactory.

A MILL FOR EL PASO.—A diepatch from El Paso, Texas, dated March 18th, says: The Grande Milling and Refining Co., which has a large stamp mill in the City of Guanajuata, Mexico, has proposed to our citizens the establishment of a smelter, reduction works and a refinery here if they will donate sufficient land for their use, with water-power for the same and a rebate of the taxes on the plant for a term of years. The managers of the above-named company are ex-Governor Gregory Smith, of Vermont, president of the Vermont Central rail-

road; ex-Governor J. B. Loomis, of Connecticut, president of the Dayton & Wooster railroad; D. D. Conover, president of a New York city street railroad; Havemeyer, the millionaire sugar refiner of New York, and President Ross, of the Canada Grand Trunk railroad. They represent over \$200,000,000 and they have \$200,000 worth of machinery already purchased and en route to Guanajuata, which they will stop here if the donation which they ask, and which will only cost the city about \$15,000, is made. A committee of prominent citizens is soliciting funds to day to make the purchase. The establishment of the plant seems now to be assured and will compete with Kansas City. The mill will treat all ores from Mexico, New Mexico and Arizona.

Injustice to the Miners.

Minning or Grazing and Timber Land.

The Fine Gold Miner (Hildreth, Fresno Co.)

says:

It has been learned of late that the Abbey Mining Company and Charles O'Neil are trying to obtain a patent from the State for the 640 acres comprising section 36, township 9 south, range 21 east, as grazing and timber land. At the time of the sectionizing of this and adjoining townships, in 1872, by Benson and Glover, United States land surveyors, then working under contract with the Government, all mining to speak of had ceased for want of capital to develop the rich deposits of mineral that is now being brought to the surface by different mining companies; and for want of metallurgical knowledge, undoubtedly, the Surveyor's report was to the effect that the section was more valuable for its oak timber and grazing than for its mineral deposits. This is how the case now stands at the Land Office in Sacramento. But will some authority upon such matters inform the *Miner* how any citizen or company can file a timber claim upon a section that has 18 paying quartz ledges, numerous good prospects, and seven placer claims thereon, not including the Abbey mine, that has been producing \$50,000 monthly since last June, the Hildreth mine, that has expressed \$75,000, and which to-day is the best mine of the district—one being situated in the east half and the other in the west half of the section filed on; and the filer of the west half owning one-third interest in a prospect that he holds at \$1000, while the McNally Company would not sell their mine for \$500,000. The granting of this claim would work a great injury to our miners and prospectors, who have shafts and tunnels hundreds of feet in length upon ledges on this land that will mill from \$18 to \$100 per ton; and as to the few standing oaks upon this section that are situated upon these claims, the miner rightly becomes owner of in order to carry on the development of his prospect. Of course we all understand the object here of the claimants. It is their purpose to secure the few remaining cords of oak wood for the Abbey Company, and to protect themselves against the power of the U. S. Marshal to claim stumpage. Other than for mining purposes this land is valueless eight months of the year. It is burnt and baked to that degree that the pick leaves little impression against its hard surface. This land heretofore was always supposed to be school land, but nevertheless it is mineral if ever a section was; and we think that our citizens have gone at it in the right way—to prove by over 100 miners' depositions to the Department that the land ought to revert back to the U. S. Government as mineral land. Not only is the surface of this section covered here and there with the croppings of mineral-bearing quartz and float, but scarcely is there a gulch and ravine that does not prospect placer gold in paying quantities. There is no doubt but that the action taken by our miners will accomplish the desired result.

NYE COUNTY MINES.—The Belmont *Courier* says: Nye county is thick with low-grade mines that will be worked as soon as railroads will enable parties desirous of operating them to get in mining supplies at a price that will justify opening them on an extensive scale. A railroad through Nye county will do more to develop its resources than is generally imagined. Capital will not handle low-grade mines where supplies have to be hauled 100 miles or more by mule teams. When a company of men put up their money to work a low-grade mine they will select one where freight will not be the largest item of expense. We look for a boom in this county as soon as the through railroad is completed, and a lasting boom at that. A steady era of prosperity will set in when the Ophir, Belmont, Spanish Belt, Tybo, Manhattan, Revelle, Morey, Danville, Hot Creek, Jefferson, San Antonio, Northumberland, Jett, Park, Washington, Ione, Grantsville, Centerville, Ellsworth, Downeyville, Globe, New Buffalo, Lodi, Gold Park and Paradise mines are operated to their fullest capacity, which will be when railroads are handy and freight low.

BACK NUMBERS WANTED.—In order to complete certain files of the MINING AND SCIENTIFIC PRESS, we should be glad to get certain back numbers. Any one having any of the following numbers of the PRESS will please communicate with this office:

1869—Jan. 2d, 9th, 16th. Feb. 27th. March 20th. April 17th, 24th. May 1st. June 12th, 19th, 26th. 1875—Sept. 11th. 1880—July to December.

Pocket Mining.

The Divoll Bonanza in Tuolumne County.

A correspondent of the Tuolumne *Independent*, speaking of the Divoll bonanza, says:

This wonderfully rich mine, "The Divoll Bonanza," has again come to the front as a gold-producer—yielding in the past few days, \$65,000. This time the gold has been found on the footwall; whereas formerly all the pockets have been found on the hanging-wall vein. There are three veins in the fissure—one on hanging, the other below in the dyke, the third on footwall. They all average eight inches on and off. In the present case this footwall vein is as large as nine inches. Both walls are metallic slate. The filling of fissure is an eruptive rock, or igneous dyke "diorite," decomposed and oxidized in the upper levels of the mine, getting harder as depth is attained. The gold is formed by a quartz or raw crossing, running with the slate and having same dip as latter. At the point of contact the gold is thrown, almost always to the east. Course of fissure, east of north, 45 degrees; angle of dip, 25 degrees—a flat fissure vein. The "shoot" is found sometimes close to the crossing; then, again, some ten feet to the east, which is the case in the present find. This is the first occurrence in the history of the mine of any deposit of precious metal having been found on the footwall vein. This Bonanza, as far as exposed, is 18 feet on the length of the vein, and three feet in depth; but the present lucky owners have a good prospect of yet taking out as much more before the pocket will be exhausted. In fact, it may now almost be considered a new mine, this vein never having been worked on before; and as the pockets on the hanging-wall formerly "bunched" in that shoot, nearly every 10 feet as sunk on, there is no reason why the footwall vein should not throw gold in like manner. This gives some little idea of the great value of this property, and it would not surprise me if the mine produced in the future as much, or more, than ever has been taken out; at any rate, present indications warrant the assumption. The width of the fissure is from 9 to 12 feet, and carrying the three veins, as before stated, with dyke as filling matter. The gold is worth about \$19.20 per ounce.

It may be of interest to some of your readers to give a brief history of this very remarkably rich mine—this almost fabulously Aladdin's lamp of Tuolumne county.

This mine—which is located on the west side of Washington street, in the city of Sonora—was first discovered in '51 by Chilians, who took out a large amount of gold and left for their native soil rich men; but in those days a pocket mine was considered worked out after the first "bunch" was extracted. The idea of there being any chimney or shoot was not understood then. But time, and further explorations by other parties, proved the fallacy of the then conceived idea. After the Chilians had worked out this pocket they sold it to an English company, who in their turn also unearthed considerable gold, but either gave it up or sold—thinking sure that the mine was then actually worked out. But the late Capt. Clark and Joe Bray had a different opinion. They purchased it, I believe, from Messrs. Edwards and Sexton for \$50. Then these two indefatigable miners set to work, prospecting and sinking, with a small windlass. They obtained good prospect going down, and Mr. James G. Divoll became then interested through Joe Bray, they being old partners. Suffice it to say, that during their tenure they extracted nearly \$1,000,000, from 1878 to 1882. After that time, Clark felt he had enough money for his wants; and Bray thinking likewise, both sold to Divoll. Hence his name to the mine became as familiar as household words. Divoll then worked it under the superintendency of Mr. Bray, taking out \$100,000. The mine became wet and somewhat expensive to work. Divoll put up steam-pumping and hoisting works, but not being of a very high class of machinery—what might be called a "make-shift"—did not meet the desired end. He sublet to Capt. Colby, another old pocket miner, who owns the north extension, on the same fissure (who has also been very lucky in finding rich gold in his mine), who concluded to lease the Divoll. He increased the steam-power, but was unfortunate, getting nothing of any moment. Although, as I have been told, he was within six feet of the last rich strike which we now chronicle, he gave it up for want of funds. Divoll then took two San Francisco gentlemen as partners. They put a crosscut adit level from the creek, some 600 feet in length, but found when the vein was tapped that it left them still some 200 feet from bottom of incline. This company of three, gradually tired of their venture, sold back to Divoll, he having unbounded faith and confidence that the "Aladdin's lamp" would shine again; that it was there, and only required time, money and energy to develop still richer bonanzas. He leased the mine lastly to Meese. Dart and Dave Oliver on a certain percentage. Dart, not caring to pack his interest as a whole, made arrangements with another old and experienced miner, Mr. A. P. Johnson, to work his share, this arrangement being satisfactory to all concerned. The party went vigorously to work, above water level, through the adit; and, believing that, as the hanging-wall had been so rich, the footwall on the same gold line should produce pockets, they have been now, as before stated, handsomely re-

warded for their faith. These gentlemen have a thorough knowledge of pocket mining, and possess the requisite "grit" to stay with it and hack their opinions by cash to develop. Our old friend, Divoll, has now realized his oft-expressed opinion that there are millions in the old mine yet, and that ten times as much as ever has been found. That may or may not be; but indications point strongly that such may be the result in the future.

This latest find in old Tuolumne give a great impetus to prospecting. The expenses attached to pocket mining are very small; no expensive mills required, but a good grinding and amalgamating pan is the only desideratum. A small melting furnace is very handy.

I will just mention one feature of this vein before I close. The size of vein and length of "shoot" on the vein depends on the size of the pockets. For instance: From the center of the richest part of the pocket, which is almost pure hullion, it radiates in a circle to, in some cases, 20 to 30 feet, spreading over the vein, the outside being less rich than the center, forming very rich milling ore—several tons to each pocket. The bonanza portion is cleaned of the adhering quartz, and melted into bars. The gold seems to be formed, almost, so to speak, in concentric rings—richest in center, and gradually weaker till exhausted to outer circle. This was the case on hanging-wall. The footwall, in this case, adapts itself to a plane, forming a parallelogram.

The Government Printing.

Perhaps few are aware that the United States Government is the greatest printer and publisher in the world. Every one who has made a hasty visit to Washington has come away with the vague impression that something immense in that line is going on. The real fact is greater than the impression. No one can form an adequate idea of the vast extent of the Government printing business until he takes time to examine it in detail. He must visit the Government printing establishment, a huge building looming up north of the Capitol. Here he will find that printing presses are counted by the dozens, type reckoned by the ton and paper by the carload, and hundreds of men and women at work, day and night, type-setting, stereotyping, printing and binding, and the thousand processes incidental to such a business. The presses, type and material of all kinds are the best procurable. Uncle Sam keeps up with the times in utilizing the latest and best labor-saving mechanisms.

Then there are two large buildings to the south of the Treasury Department, almost under the shadow of the Washington monument, where our visitor will find the Bureau of Engraving and Printing. Here the fine work is done; the notes and stamps are printed and the Government engraving accomplished. It is an immense establishment, and a hurried walk through the rooms open to the public will show hundreds of men and women, boys and girls at work on splendid presses, costly material, and so much of the fine work as the public is allowed to see. Next let him visit the Government storehouse and take a glance at the tons of books piled up like cord-wood, and he will begin to have some conception of what the Government is doing. The aggregate number of Government publications now annually amounts to about 2,500,000, of which 500,000 are bound volumes.

If he cares to explore what comes of this vast mass of printed matter, he will find a deal of waste and extravagance. Most of the books and pamphlets published by the Government are intended for general distribution, and the theory is that they are sent as far as practical to the public and college libraries of the country. But it is safe to say that not one in ten are supplied with these publications, many of which are of great value to science and history. There is not a library in this State to-day that has a complete set of all the various public documents. One of our late Congressmen, having occasion to look up a matter in the *Congressional Record*, visited the libraries of San Francisco and the State Library at Sacramento and failed to find the number he wanted. This is owing to the defective and vicious system of distribution which depends largely upon the members of the two houses of Congress. Some of the members take pains to distribute public documents where they will do the most good, but the average Congressman regards them as official perquisites to be used where they make friends and influence votes. They are just as apt to go to a corner grocery or a city ginmill as to a public library. Many are too busy or too lazy to hunt up the people or libraries that would appreciate such publications, and find it easier to add to their cigar money by selling their shares to the brokers. Every one who has been to Washington and had occasion to look into the matter, knows that the brokers and second-hand book dealers carry on quite a lively local trade in these publications. Reports that cost the Government from 50 to 75 cents may be found at retail in the broker's shops at from five to ten cents a copy. There is no good reason why our public libraries should be so scantily supplied with public documents, for they may be had in abundance for the asking.

W. A. CLARK and others recently purchased the Hunter group of mines in the Cour d'Alene country for \$90,000.

Treating Wine by Electricity.

A New and Important Discovery.

One of the most interesting features connected with the late Viticultural meeting at the Grand hotel in this city, was the exhibit of Dr. Edwin J. Fraser, of his new process for aging wines by electricity, or rather by magnetism; for wine, by this process, is not submitted to the direct action of electricity, but is simply placed in the magnetic field produced within the circumference of an electric coil, and therefore is acted upon only by the indirect action of the electric current.

If we place a piece of soft iron within a coil of insulated wire, and send a current of electricity through the wire, the iron becomes a magnet and attracts other iron as a magnet does. If, instead of placing a piece of iron within the coil, we place there a solution of any crystallizable substance, the action of crystallization will go on with great rapidity. The crystals will form three or four times as rapidly and much more perfectly than when the same solution is placed in the same temperature outside and beyond the influence of the electric coil. From these experiments we learn that the force, or whatever else it may be, within this coil exerts certain marked and important effects. That chemical action within the influence of the coil is much more marked and rapid than when that action goes on under natural conditions. But little attention has heretofore been paid to the study of the magnetic field of a coil of insulated wire. The matter is just beginning to attract attention.

Some two years since, Dr. Fraser placed some wine in this field, and carefully noted the results which followed. In doing this, he simply wound some insulated wire around a glass jar, and also around a small two-gallon cask. The wire was thoroughly insulated and wound as close as possible, the coils being closely pressed against each other.

The wine after remaining in these vessels from 30 to 40 days was found to have undergone a remarkable change. It had become "aged"—that is, rough, unpalatable, new wine, in 30 days of such exposure became soft and pleasant to the palate, and in every way tasted and appeared like wine which had been subjected to from one to two years "ageing" in the usual way. Here was a discovery, and a most important one, too. Right here it may be observed that quite a remarkable change also takes place in brandy and whisky under the same conditions.

After taking the wise precaution of securing patents for the discovery both in this country and Europe, Dr. Fraser called in his friends to witness and confer with him upon this important discovery. That conference was made up of some of our best wine experts, several well-known chemists and electricians and members of the press. All present expressed themselves much astonished and highly pleased with the experiment and its attendant results. The only questions of doubt were as to the manner in which the change was brought about—the chemistry thereof, and whether the improvement was a permanent one.

To solve these questions and to discover the exact chemical changes which took place in the wine, and also to learn what would be the result when the experiments were committed to other hands, Dr. Fraser called upon Mr. C. A. Wetmore, of the State Viticultural Laboratory, and Prof. E. W. Hilgard, of the Agricultural Department of the State University, with the request that they should repeat the experiments at their own laboratories, which they have done with the same results as have attended the experiments of Dr. Fraser. The reports of both these gentlemen were submitted to the public at the viticultural meeting above alluded to.

The Report of Prof. Hilgard

Is especially interesting and important, from the fact that close and careful analyses accompanied his experiments, which have brought to light the exact chemical changes which the wines treated undergo. We append the report:

For some months past, experiments on the process of maturing wines rapidly in the electro-magnetic field, as proposed by Dr. Fraser, of San Francisco, have been carried on in the Viticultural Laboratory of the University. The wines submitted to the treatment were mostly made in the laboratory itself, and therefore positively known to be pure. The process was carried on in three-gallon glass jars sealed with paraffine, and around which there was a double coil of insulated copper wire through which a current of from $\frac{1}{2}$ to $\frac{3}{4}$ ampere, generated by a constant battery, was circulated. To this influence the wine within the jars was exposed from three to six weeks at a time; the wine was analyzed at the outset, and samples of the same were kept in glass outside of the electro-treatment for comparison both by taste and analysis.

[The results are given in a carefully prepared table which it is not necessary that we should produce; but which are summarized as follows in the professor's report:]

The wine under treatment did not seem to deposit either more or less sediment than the sample left outside, untreated; and there seemed not to be, at any time, an appreciable difference as to clearness of the treated and untreated samples. Each time, after the second week, a notable difference in the "smoothness" of the samples on the palate began to manifest itself; it was always unmistakable after the third week, and the difference seemed to increase at least up to the fifth week. A comparison by taste indicated in every case a decrease of acidity and a more pleasant character of the acid, and the bouquet of a very much more mature wine became apparent.

Analysis of the treated wines shows almost throughout the following facts: A decrease of both acid and alcohol, indicating that a combination of the two into ethers has occurred, as in the natural maturing process. No appreciable change in tannin or color.

It thus appears that at least one of the processes that characterizes the usual process of maturing is very greatly hastened by the electro-magnetic treatment, and that an unmistakable improvement of the wine on the palate takes place. Whether the wine so treated is to be considered as similarly advanced in all other respects, remains to be determined by further experiments. But to the extent to which action has occurred, that action may be considered as permanent.

From the above report and from analyses long since made, it is a well-known fact that wine and all other alcoholic liquors, no matter how produced, are composed mainly of alcohol and water—the alcohol varying from 10 to 50 per cent of its volume. Also, that the characteristic bouquets and flavors are imparted by a variety of essential oils and other elemental ingredients, among which may be mentioned oil of cognac, fusel oil, gum, mucilage, dextrine, wax, glycerine, albumen, carbonic, tartaric, malic, citric, tannic, acetic and other acids, and a variety of delicate flavors derived from the grains and fruits from which the liquors are made. When liquors are new these essential oils, acids and other ingredients are mechanically mixed with the dilute alcohol, which gives to the liquor a raw, racy, and acrid taste and smell.

Heretofore, time only has been relied upon to age or ripen liquors by converting the essential oils into ethers. Various mechanical and chemical agencies have been tried to effect such a conversion, but without success, until the present discovery. Efforts have been made to age wines by extracting therefrom the supposed deleterious and unpleasant essential oils which they contain when they first come from the fermenting tub; but experience has proven that these essential oils cannot be removed without destroying the very essence which gives life and bouquet to the wine.

The True Theory.

And that followed by nature, is to unite—not to separate or remove them. Dr. Fraser employs one of nature's most powerful and effective agents to do in a few days what unaided nature requires many months, even years, to accomplish. Assuming the very probable theory that the natural ageing, or more properly blending of the component elements of liquors are brought about by terrestrial magnetism, in its naturally diffused condition, years of time are necessarily consumed in accomplishing the best results. The new process by concentrating those potent magnetic forces simply abridges time. By this process, which is simply an "induction method," no electrodes or wires are placed in contact with the wine and no currents of electricity are passed through it. It is simply placed under magnetic influence, in a peculiar manner, and the desirable chemical changes take place.

The changes being elemental, are therefore lasting. There can be no deterioration or "going back."

What It Will Do.

This invention promises to revolutionize the liquor industry of the world. In a few weeks of time it prepares all kinds of still wine, brandy and whisky for market, and makes them equal in every respect to the old. It prevents the usual loss by evaporation, which ordinarily amounts to 15 or 20 per cent. It saves from three to five years' interest on the original cost. It obviates a large outlay for barrels and casks, and also for vaults and buildings, and it saves all the labor and care usually bestowed upon liquors matured by age.

Its Benefits to California.

This scientific discovery comes at a most opportune time, to benefit one of the great leading industries of our State. Several millions of gallons of new and unsalable wine and brandy are now in store, awaiting the process of time to ripen for use. Stimulated by the certainty of a quick and profitable market for her wines, made possible by means of this new discovery, California promises eventually to rival France as a wine-producer. Her now unproductive foothills and mountain slopes will soon be peopled by industrious vine-growers, and the expression, "Vine-clad California," will be as familiarly spoken as "Vine-clad Italy."

From experiments already made it is estimated that, by the use of the "Fraser Process," every gallon of new wine produced in the State can be ripened and fitted for sale or use before the next crop comes in. It therefore obviates the necessity of carrying stocks for a period of three, four, or five years. It enables the wine-maker to turn over his money every year. By its use a large proportion of the expenses of maturing by age are saved, such as interest, insurance, cellar-room, cooperage, evaporation, labor and loss by handling.

What is Proposed.

That the wine interests of California may immediately make available this new discovery, the Fraser Wine Co., of California, has been incorporated. It has secured exclusive control of the Fraser patents for the State of California, and by their aid it can age all the wine and brandy produced in the State every year before the next vintage. Being organized, its purpose is to extend the benefits of the "Fraser process" to all wine producing sections of the State, so that every vinegrower and winemaker may be benefited thereby.

The New Game Law.

The game law of the State, as just enacted, is formed by amending Sections 626, 631 and 636 of the Penal Code, and reads as follows:

SECTION 1. Section 626 of an Act entitled "An Act to establish a Penal Code," approved February 14, 1872, is hereby amended so as to read as follows: 626. Every person who, in the State of California, between the 1st day of March and the 10th day of September, in each year, hunts, pursues, takes, kills or destroys quail, partridges, or grouse, or rail, is guilty of a misdemeanor. Every person who, in any of the counties of this State, at any time takes, gathers, or destroys the eggs of any quail, partridge, or grouse, is guilty of a misdemeanor. Every person who, in this State, between the 1st day of January and the 1st day of June, in each year, hunts, pursues, takes, kills or destroys doves, is guilty of a misdemeanor. Every person who, between the 15th day of December, in each year, and the 1st day of July in the following year, hunts, pursues, takes, kills, or destroys any male antelope, deer or buck, is guilty of a misdemeanor. Every person in the State of California who has in his possession any hides or any skins of deer, elk, antelope, or mountain sheep, killed between the 15th day of December and the 1st day of July, is guilty of a misdemeanor. Every person who shall at any time, in the State of California, hunt, pursue, take, kill or destroy any female antelope, elk, mountain sheep, female deer, or doe, shall be guilty of a misdemeanor. Every person who shall at any time hunt, pursue, take, kill, or destroy any spotted tawn, is guilty of a misdemeanor. Every person who shall take, kill, or destroy any of the animals mentioned in this section, at any time, unless the carcass of such animal is used or presented by the person taking or slaying it, or is sold for food, is guilty of a misdemeanor. Every person who shall buy, sell, offer, or expose for sale, transport, or have in his possession any deer, deerskin or hide, from which evidence of sex has been removed, or any of the aforesaid game at a time when it is unlawful to kill the same provided by this and subsequent sections, is guilty of a misdemeanor.

SEC. 2. Section 631 of the same Act is hereby amended so as to read as follows: 631. Every person who shall at any time net or pound any quail, partridge or grouse, and any person who shall sell, buy, transport or give away, or offer or expose for sale, or have in his possession, any quail, partridge or grouse that have been snared, captured, or taken in by means of any net or pound, is guilty of a misdemeanor. Proof of possession of any quail, partridge or grouse, which shall not show evidence of having been taken by means of other than a net or pound, shall be prima facie evidence in any prosecution for a violation of the provisions of this section that the person in whose possession such quail, partridge or grouse is found took, killed or destroyed the same by means of a net or pound.

SEC. 3. Section 636 of the same Act is hereby amended so as to read as follows: 636. Every person who shall set, use or continue, or who shall assist in setting, using or continuing, any pound, weir, set net, trap, or any other fixed or permanent contrivance for catching fish, in the waters of this State, is guilty of a misdemeanor. Every person who shall cast, extend or set any seine or net of any kind for the catching of fish in any river, stream or slough of this State, which shall extend more than one-third across the width of said river, stream or slough at the time and place of such fishing, is guilty of a misdemeanor. Every person who shall cast, extend, set, use or continue, or who shall assist in casting, extending, using or continuing, "Chinese sturgeon lines," or "Chinese shrimp or bag nets," or lines or nets of similar character, for the catching of fish in the waters of this State, is guilty of a misdemeanor. Every person who, by seine or other means, shall catch the young fish of any species, and who shall not return the same to the water immediately and alive, or shall sell or offer for sale any such fish, fresh or dried, is guilty of a misdemeanor. Every person convicted of a violation of any of the provisions of this chapter shall be punished by fine of not less than \$50 and not more than \$300, or imprisonment in the county jail of the county where the offense was committed for not less than 30 days nor more than six months, or by both such fine and imprisonment. One-third of all moneys collected for fines for violation of the provisions of this chapter to be paid to informers, one-third to the District Attorney of the county in which the action is prosecuted, and one-third to the Fish Commissioners' Fund of the State of California. Nothing in this chapter shall be construed to prohibit the United States Fish Commissioners or the Fish Commissioners of the State of California from taking such fish as they shall deem necessary for the purpose of artificial hatching, nor at any time. It shall not be lawful for any person to buy or sell, or offer or expose for sale, within this State, any kind of trout (except brook trout) less than eight inches in length. Any person violating any of the provisions of this section is guilty of a misdemeanor. The Board of Supervisors of the several counties of this State are authorized, by ordinance duly passed and published, to change the beginning or ending of the close season named in Section 626 of this Code, so as to make the same conform to the needs of their respective counties, whenever in their judgment they deem the same advisable.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAMPLING APPARATUS.—Wm. Jones, S. F. No. 359,158. Dated March 8, 1887. This is an apparatus whereby thoroughly reliable samples of large quantities of materials, such as grain, cement, crushed ore, rock or other substances can be obtained during their passage to a storing floor or elsewhere.

STEAM ENGINE.—J. T. Kenworthy, Daniel Sexton and Albert Thompson, Colton, San Bernardino Co. No. 359,160. Dated March 8, 1887. The invention consists in the arrangement of cylinders and their connection with the crank-shaft, the valve chests and their valves and means for operating them, and their connection with the piston-rods. The object is to provide an engine adapted to be operated by steam, water or hot air, as may be most convenient.

STORAGE FLOOR.—Wm. Jones, S. F. No. 359,159. Dated March 8, 1887. This is a new and useful floor for storing quantities of materials, such as grain, cement, crushed ore, rock, etc. It consists in a floor which is composed of a number of independent movable pieces or strips laid close together upon suitable supports, and adapted to support the materials and by their movement to discharge them; in inclined plates within the compartment or room, and overlapping the ends of the movable strips of the floor, whereby a space is formed from which the materials stored upon the floor are excluded, thus affording opportunity for handling the strips of the floor; and in a mixing chute located below the floor.

COPYING-PAPER.—Emory I. Nichols, S. F. No. 359,170. Dated March 8, 1887. This consists in a piece or sheet of blotting paper saturated and coated slightly with a liquid solution of glue, water, ammonia, sugar and glycerine. In ordinary hectographs, one of the essentials is that the pad or impression-surface shall have the property of remaining moist. It must always remain moist and non-absorbent, which necessitates the washing off of the impression after an operation of copying has been completed. This new copying-paper does not remain moist, but has, on the contrary, to be frequently wet with water; but it does not have to be washed to remove the impression, as the whole of it will be absorbed by laying the sheet aside for a certain length of time. By not having to wash it, the inventor saves much trouble and inconvenience.

SASH-FASTENER.—Eugene Sherwood, S. F. No. 359,193. Dated March 8, 1887. The invention relates to the class of locks or fastenings applied to the sashes of windows for the purpose of fastening or securing them, whereby they cannot be opened from without, thus preventing an unlawful entry. It consists in a bolt seated on one sash and adapted to engage the other, said bolt having a rack stem, an operating pin, also seated in the first sash and influenced by a spring, said pin having a rack stem and a pinion engaged on opposite sides by the rack stems of both bolt and pin, whereby the movement of the latter effects a reverse or opposite movement of the former. The object is to provide a sash-lock which accomplishes its locking automatically, which can be readily released from within, and which will resist all tampering from without.

STATION INDICATOR.—Gerrit H. Bade, Austin, Nev. No. 359,121. Dated March 8, 1887. The object of this indicator is to inform passengers in railway trains or cars of the approach of the train or car to a station or street, and its name, as well as the names successively of all stations or streets which the car has to pass. It consists of a disk resembling a dial, placed within the car and provided with the names of the stations or streets successively, a band playing over the dial, a gong with hammer for striking it, power mechanism for operating the hand and hammer, and provided with an escapement mechanism, oscillating crank-shafts mounted on the car and connected with the escapement mechanism, and standards with arms located beside the roadway at proper distances on each side of the stations or streets, and with which the crank-shafts on the cars engage, whereby the indicator is operated.

BICYCLE.—James Brusie, Oakland. No. 359,127. Dated March 8, 1887. The object of this invention is to prevent those accidents known among wheelmen as "headers," and which result from any sudden stoppage of the machine, or unusual forward lurch of the rider, whereby the frame of the machine travels forward around its pivotal center on the axle, and thus carries the rider beyond the center of gravity. In this device a guard wheel is located forward of the main or large wheel, and there is an adjustable connection between the said wheel and the head or forks of the machine, by which said guard-wheel may be set in the desired proximity to the ground in front of the large wheel, or he raised up out of the way. When there is a tendency to a header, and the forks move forward on their pivotal center, the little guard-wheel is arranged to come in contact with the ground and stops the forks, whereby the header is prevented.

Passing Events.

As will be seen from our mining summary, several quite rich mining strikes have been made recently, the notable ones of which are those of the Nevada County mine and the Divoll mine. The quartz mines of this State will make a good record this year.

Just at this time the manufacturers of this coast are quite anxious to know how the Interstate Commerce bill will affect their interests. The very large increase of through freight rates by rail between here and the East is bound to affect business on this coast. Some departments of local industry will be benefited, and others will not. The new rates will go into effect very shortly.

Active steps have now been taken to establish the Cogswell Polytechnic school, of which we spoke last week. The Trustees have been appointed, and it is stated that the school will be in operation within a year. An institution of this character will be of great benefit to the industrial classes on this coast.

Our larger cities are crowded with tourists and visitors from the East, and the interior towns are receiving accessions to population. On all sides—all over the State—are evidences of rapid growth and advance of values. This year will doubtless be a very prosperous one for California.

Preliminary Notices in Patenting Mines.

While the preliminary steps in taking up a mining claim, as far as legal requirements are concerned, are very simple and easily performed, those relating to patenting the claim are somewhat complicated—that is, they are to persons unaccustomed to such matters, and it is always best for miners to get proper legal advice before doing anything about procuring the patents. In either case, locating or patenting, miners cannot exercise too much care. If the claim turns out a valuable one, and the records are not all clear and correct, litigation is apt to ensue. This is particularly the case when patenting the claim. It is difficult and annoying enough, under the best of circumstances, to get mining patents through the Land Office Department. It costs too much and takes too long a time in any instance; but where there are any "hitches" of any kind, great expense and delay are incurred.

A decision in relation to the necessary preliminaries in mining cases has just been made in Washington. The Secretary of the Interior has decided the case of Bodis, Cal., mineral entry No. 17, made Dec. 1, 1883, by Henry Williams for the Great Western lode claims. He holds that the entry-man has complied with the law as to publication and posting of notices. Mr. Sparks declined to approve the entry for the patent, holding that the posting in the local land office did not cover the entire period of publication upon the entry; that if that publication is for a longer period than 60 days, the posting in the local office must cover the entire period of publication, although an identical period of 60 days may have been covered by the publication and posting of the notice in the local office. The Secretary says that when the notice is required to be given by different forms and modes to cover the same continuous period of time, a notice by either of the different modes will not run against an adverse claimant until the notice has been given by each and every mode and for the required time. Hence, as in this case, an adverse claimant does not take notice by publication until the notice is posted in the California office, as required by law. Although the publication may have commenced from the filing of the notice in the local office, the 60 days within which adverse claims were filed will be computed from the time the notice has been given by all the modes required.

The Hydraulic Miners Score a Point.

The suit brought by the city of Stockton against fourteen hydraulic mining companies, seeking to restrain them from further prosecuting their operations, has been dismissed as against all but one of the defendants, Judge Pressey, before whom the proceedings were had, finding that the natural wash and the plowing of the ground by the farmers contributed vastly more toward producing the mischief complained of than the operations of the hydraulic miners.

Had the bill relating to this subject introduced into the Legislature at its last session been passed by that body, the miners, under its provisions, would have been enabled to determine how far it would be possible for them to so impound and otherwise dispose of their tailings that they would cause little or no damage to any other interest. But despite the failure of that bill, the parties most interested in this issue ought to be able to get together and dispose of it in a manner which, if not wholly satisfactory to both, would avoid any very serious damage to either. Only in this manner can it ever be settled. Nothing, it would seem, can ever be hoped for through legislative action. How little litigation has done toward its determination has been seen. After a ten years' contest of this matter in the courts, it remains apparently as far from a settlement as at first, for the miners, encouraged by this late decision, will be apt to keep up the fight, which in any event they probably would have done. Only in friendly conference, and by exercising a spirit of moderation and compromise, can this trouble be adjusted and finally disposed of, each party to the controversy being willing to concede something, and, if necessary, suffer quite a good deal.

It is stated that the Spring Valley mine, Cherokee Flat, Butte county, will be started up again and run in the interest of the miners,

The Cogswell Polytechnic College.

We mentioned last week that steps were being taken by Dr. Henry D. Cogswell to establish a polytechnic college in this city. On Saturday last he deeded large realties, roundly valued at over \$1,000,000, to a Board of Trustees, for the purpose of establishing and maintaining in the city of San Francisco a polytechnic college, which shall snailish Californian boys and girls over the age of 14 years to acquire a practical training in the various industries by which it is possible to make an honorable and comfortable living.

In addressing the assembly of friends called to witness the transfer, Dr. Cogswell said:

"The education that does not prepare one to intelligently direct his labor is not worthy of consideration. We are sorry to say but little effort is made in our present system to prepare children to use their knowledge in assisting them to gain a livelihood. Most of our boys and girls have no occupation and are not fit for one when they leave school. They have learning, but no capacity. The time has come when this should be changed. The nineteenth century calls for the training of the eyes and the hand, and stamps it as just as important as the study of grammar, geography, and arithmetic. Educated working men and women are necessary to solve the great labor problems that will arise in the future. For the purpose of this education there is room and need for technical schools in all quarters of our country. Mental industry can exist only along with physical industry; hence the true school should give both mental and physical culture. For the purpose, then, of providing the boys and girls of the State with a thorough training in mechanical arts and other industries, we have made the grant, as set forth in these papers, providing for the founding and maintaining of the Cogswell Polytechnic college. I present them to you, believing that you will faithfully execute your trust to the best of your ability."

The trustees named in the trust-deeds are Moses Hopkins, Charles B. Stone, H. D. Cogswell, Caroline E. Cogswell, Mrs. E. M. Arnold, James G. Kennedy and Thomas B. Bishop. The deeds contain a condition that the trustees establish and maintain the school according to the idea of the donor, and provide that they shall not sell nor mortgage the property, but shall support the college from the revenues derived therefrom. Dr. Cogswell also proposes to give the trustees \$60,000 in cash, wherewith to commence operations and erect suitable buildings.

The trustees, all of whom were present, accepted the trust, and pledged themselves to carry out its provisions.

On Monday the trustees elected Dr. Cogswell president, Mrs. Arnold secretary, and Mr. Stone treasurer, and appointed a Committee on By-laws.

Chas. Geddes, the chosen architect, is already at work upon the plans of the buildings, which will be at Twenty-sixth and Folsom streets. We refrain from giving further details to-day as to the elaborate structures and courses of study proposed; and will merely add that the trustees hope to have the school actually open by January 1, 1888, with accommodations for 200 pupils at the outset.

A New Amalgamator.

Frank A. Huntington, the designer and manufacturer of the Huntington ore mills and crushers, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency an amalgamating pan constructed quite differently from those commonly in use. The pan or tub may be made square, oblong, or of other polygonal form which will form angles and inter-ruptions sufficient to prevent the material within the tub from being carried round and round by the action of the stirrers. These stirrers consist of propeller-shaped blades secured in pairs on vertical shafts, the pieces being so bent that the upper and lower blades upon each shaft have their pitch in opposite directions. This causes the complete agitation of the pulp in the pan, bringing all parts of it into intimate contact with the mercury in the bottom of the tub and preventing it from settling, while the angular form of the tub prevents a smooth rotary current being established on account of the centrifugal action. The tub or pan is also provided with one or more shelves at each corner, upon which the pulp is thrown during the rotations of the propellers.

Mr. Huntington states that he finds it preferable to employ two or more of the vertical shafts, which, if the pan is rectangular, may be

arranged in line, or, if made triangular in shape, would be placed similarly with reference to each other. These shafts are suitably journaled and extend upward so their driving pulleys at their upper end may be driven by a single belt.

The supporting boxes of the pulleys are secured to a frame which is supported from a central shaft extending down through the bottom of the tub, and having its step upon a lever by which it may be raised and lowered, thus raising the propellers, which is necessary in order to free them from the sand and heavy material that would settle about the lower ends when the apparatus is stopped. By thus raising the propellers temporarily when the machine is started, they will soon agitate the whols of the material and loosen it up again sufficiently to allow them to revolve freely, when they may again be allowed to sink to the usual position.

Foundry Notes.

The building of new and extension of old cable roads will no doubt keep the Pacific Rolling Mills busy in furnishing yokes and other material.

The increase of our coasting trade and the building of new vessels is greatly benefiting our local foundries. At the Fulton Iron Works they are now building no less than ten marine engines. Most of these are for the steam schooners which are now running to and from the lumber landings on the coast. They do not rely on steam alone, and the engines may be considered auxiliary. They steam up the coast and make their landings, but sail back with the strong and favorable winds of summer. In case of a head-wind, or in making their landings, steam is used.

The Pacific Iron Works are at work on some dredging machinery plans for the Carson river dredging enterprise. At these works they are also making some appliances for the new process of Dr. Rae, for utilizing electricity in the prevention of loss of mercury and amalgam in silver mining on the Comstock.

At the Union Iron Works they now have between 800 and 900 men at work. About 200 of these are in the various departments of the shipyard. The keel of the new cruiser will be laid in about a month, and preparations are being vigorously carried out for work on the vessel. In the shipyard the largest piece of work in hand is the repairs to the Pacific Mail iron steamer San Pablo, which is being fitted for the passenger trade with China. An additional deck has been put in, making four, and raising the depth of the vessel nine feet. The new dry dock is nearing completion. A massive iron framework, 435 feet long and 65 wide, is in place, which will be settled in the water until a steamer will float over it, and then raised high and dry, vessel and all, by powerful rams. Among the large jobs lately done in the machine-shops is a double pumping apparatus for the Spring Valley Water Works, and a 60-stamp mill for Butte, M. T. The mill is completed, but will not be shipped before May or June.

Frank Huntington, the manufacturer of quartz-working apparatus, has made and sold 17 of his Huntington mills so far this year. Two 3½-foot mills have gone to Eureka, Nevada; one 5-foot one to E. Probert; one 3½-foot to the Treadwell mine, Alaska; four 5-foot to the Manhattan Mining Co., Austin, Nev.; one 3½-foot one has been sent to Sydney, and one 5-foot one to White Oaks, New Mexico. Mr. Reilly, who recently purchased the Bell & Hopping mine, Shasta Co., has concluded to increase his crushing capacity by the addition of one 6-foot Huntington roller mill. This additional mill is considered equal to a 15-stamp battery.

A Curious Outburst.

The town of Baku, Russia, was recently threatened with destruction by the sudden outburst of a natural naphtha fountain. This was soon followed by a volcanic eruption from Lok Botan, close to the Ponta railway station, and about ten miles from Baku. When the eruption began, the inhabitants of Baku were alarmed by a shock like that of an explosion, which made all their window-panes tremble violently, while toward the south-west the sky was illuminated by an intense light, as of some terrific conflagration. The following in-

formation was furnished by the railway officials of the Ponta station:

"Quite suddenly at 11 o'clock at night, the noise of an explosion was heard, and the summit of Lok Botan shot up an enormous column of fire some 350 feet high. The whole country was instantly lit up brighter than day, and the heat could be felt at nearly a mile from the crater. There was scarcely any wind, so that the column continued to ascend quite vertically, carrying with it, as could be seen, large dark substances which appeared to fall again into the volcano. This lasted, with short intervals of subsidence, all through the night and the following 24 hours; but, luckily, the matters ejected did not reach the railway station." The volume of muddy liquid thrown out is estimated at half a million cubic *sojenes*—the Russian *sojene* equalling 7 feet—and has spread itself over more than a square mile to a depth of from 7 to 14 feet.

Atomizing Sulphur.

Henry L. Lightner, of this city, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a device for reducing and atomizing sulphur, by the application of steam or heated air. The sulphur, in a crude or any suitable form, is put in a funnel-shaped hopper or receiver, around the exterior of which is fitted a jacket, into which steam is admitted from a boiler. The steam is preferably admitted at the upper end of the jacket, and the lower end is connected with the boiler by a pipe, so that the water of condensation will be returned to the boiler without other mechanism.

The lower end of the cone or receiver has a passage and a valve by which the flow of the material from the receiver is regulated. A horizontal tubular chamber is fixed to the bottom of the discharge tube, and upon one end is a conical or contracted nozzle, through which the material passing from the receiver into the chamber may be discharged. In the opposite end of this chamber a tube is led from the boiler, and the tube or connecting-nozzle extends forward to a point near the discharge-nozzle of the outer chamber.

The steam from the boiler entering the chamber around the receiver melts the sulphur placed within it, and at a pressure of about 60 pounds of steam, the temperature is sufficient to reduce the sulphur to a liquid and easily flowing condition. It passes downward from the receiver through the regulating cock into the exterior chamber, and from there is blown out by a jet of steam or hot air, in the manner of an injector, being reduced by this action to an extremely fine and impalpable powder, which is at the same time chemically pure. The atomizing of the sulphur by the blast is the essential feature. The inventor says it may be applied directly to vines or plants where it is necessary to use sulphur as a dressing or application, by having a small boiler and apparatus which can be carried around through the field for this purpose. F. A. Huntington owns a half interest in this invention.

Academy of Sciences.

The regular semi-monthly meeting of the Academy of Sciences was held on Monday evening last, President Harkness in the chair. A curious piece of sandstone, having the impression of a fig-leaf upon it, and obtained in San Diego county, was presented by John Dolbeer. Mr. Alexander Lee presented rare specimens of octopuses.

Mr. F. L. Clark gave a description of the recent eruptions of Mauna Loa, Sandwich islands, and exhibited photographs made during the recent outbreak of the volcano.

The following papers were read by title for publication: "The West Coast Pulmonata Fossil," by J. G. Cooper; "Occultation of the Stars," by Geo. Davidson; "Pacific Coast Fungi," by H. W. Harkness.

Specimens of rock from the great pyramid in Egypt were presented, and the President described at some length the quarries from which the rock to build them was taken.

Mr. Chas. G. Yale, who has been Secretary of the Academy for the past 16 years, tendered his resignation, which was accepted and a vote of thanks passed to him for services rendered. The resignation of C. Troyer, the Librarian, was also presented, but action was deferred to the next meeting. These two officers were the

only ones of the old Council who were re-elected at the recent annual election of the Academy.

Mining Accidents.

Pet King, a well-known resident of Gold Hill, was badly cut about the head last week, by a rock falling upon him, while at work in the Yellow Jacket mine.

A man named M. Javaux, employed in the Sheep Ranch mine, Calaveras county, met with a shocking death last week. He was at work in the mine and had gone to the station in the shaft for a pick. On his return he met the car in the level. On one side of the track there is ample space to permit the car's passing without injury to any that may be coming in, but upon the other side the space is not sufficient. It happened that the unfortunate man turned to the wrong side of the track, and the car caught

FIG. 1.

J. C. LANDMANN'S WATCH REGULATOR.

FIG. 4.

Improved Watchcase and Watch Regulator.

J. C. Landmann, of Eureka, Nevada, has patented an attachment for regulating the speed of watches, so that the adjustment can be made without opening the watch. Fig. 1 of the engravings shows the face of an ordinary watch, with the supplemental hand or arm for connecting with the internal gears for adjusting or regulating the speed. Figs. 2 and 3 shows the internal construction.

If the rate of speed at which the watch is running is to be altered, it is done from the face without opening the back part of the watch, by moving the hand or arm on the face. This operates the gears and pinions shown, which are suitably connected with the regulator arm, so that the desired change is made.

The improved watchcase is shown in Figs. 4

FIG. 2.

FIG. 3.

FIG. 5.

LANDMANN'S WATCH CASE.

une point of the pick which he carried in his hand and thrust the other clear through his body, causing death shortly after. Javaux had been working in the mine for a number of years, and was a man respected and esteemed.

Dan McAllen met with a painful accident Friday of last week while working in the Union mine, Calaveras. He was working in a stope about 14 feet above one of the levels. In attempting to turn a piece of slate over, his hand slipped and he fell backward to the level below. In falling, he went head first, and, striking his right shoulder on a timber, was turned partly around. When he reached the bottom of the drift he struck on his right side on a large piece of slate rock and broke two of his ribs.

Joseph Perola was killed in the Lane mine, Calaveras county. At the time of the accident he was at work digging with a pick. A blast had just been set off, and in loosening a boulder a mass of rock and timber came down and crowded him off the bench into the chute. He fell about 40 feet, and then rolled and tumbled to the bottom, about 30 feet, over the mass of rock and dirt that had been thrown into the pit. He was taken out in a few minutes, but he never spoke after he fell.

and 5. Fig. 4 is the watch open from the rear so as to show the interior. Fig. 2 is the back of the watch, with a portion of the inner case broken away, showing the improvement. The design is to protect the movement of the watch from injury in case of its being dropped.

A is the exterior case of the watch, and B is the secondary or interior case, within which the movement is to be contained. This secondary case is made of considerably smaller diameter than the interior of the outer case, and it is so held that it does not have actual contact with it by means of a spring, C, which has its center secured above the top of the inner case, its ends extending outward and passing part way round, so as to press against the sides of the case.

D is the stem by which the watch is wound up, and this extends down through the center of the spring and into the inner case, where it is connected with the winding mechanism in the usual or any suitable way. Around this stem is fitted a washer or collar, E, which is made to fit closely, and may be further secured with an elastic gum or rubber, so as to allow the movement of the interior case within the outer one without making any opening or a loose joint at this point. By this construction the movement is secure from injury by blows or falls,

and the balance-staff pivots are safe from accident, because the force of the fall is broken on account of the loose movement of the inner case and the elastic spring upon which the force of the blow is expended. Mr. Landmann desires to sell these patents together, as a whole. He may be addressed for further information as above.

In Fig. 2 is shown the balance-wheel, B, hair-spring, C, and regulator-arm, D, in the usual position. The arm, D, is made stronger in this invention than in the ordinary construction, as it has to carry the segment of a circle, E, the periphery of which is formed into a toothed rack, as shown. Through the inner case of the watch a shaft passes, and has a pinion, G, on its end, so as to mesh or engage with the rack. By the gearing shown in Fig. 3, the hand or arm in the face or outside of the watch operates this gear, G, by which in turn the regulator is operated, as described.

The Interstate Commission.

The President, after long deliberation, has announced his list of commissioners under the Interstate Commerce Act, as follows: Theo. M. Cooley, of Michigan, six years; Wm. R. Morrison, of Illinois, five years; Ang. Schoonmaker, of New York, four years; Aldace F. Walker, of Vermont, three years; and Welter L. Bragg, of Alabama, for two years. Morrison, Schoonmaker and Bragg are Democrats, Cooley and Walker, Republicans. It is claimed that the interest of the railroads is well represented on the commission.

Rumors are rife of material advance in interstate freight rates, and shippers of various kinds of produce are anxious as to the effects upon the material they handle. The Sacramento Bee has gained an intimation of what may occur in rates which we give, on the authority of that journal:

The following is a partial list of freight rates to go into effect on April 4th, when the Interstate Commerce Act will be in operation:

Between California Terminals and					
	1st.	2d.	3d.	4th.	5th.
Missouri river, .	\$4 00	\$3 50	\$3 00	\$2 50	\$2 25
St. Louis, .	4 50	3 85	3 20	2 65	2 35
Chicago, .	4 70	4 00	3 25	2 75	2 45
Denver, .	3 00	2 65	2 30	1 95	1 70

Between California Terminals and					
	A.	B.	C.	D.	E.
Missouri river, .	\$2 10	\$1 75	\$1 40	\$1 10	\$1 00
St. Louis, .	2 20	1 85	1 50	1 20	1 10
Chicago, .	2 30	1 95	1 55	1 25	1 15
Denver, .	1 50	1 20	95	85	80

There is a special tariff on the following articles from and to California points and the Missouri river: Beans, \$1.40 per 100 pounds; borax, \$1.10; canned goods and strained honey, \$1.40; hops, \$1.75; whale, fish and cocoa oils, \$1.10; vegetables, \$1.00; barley, 65 cents; wire, \$1.90; and oranges, per 100 pounds, \$1.00.

The classification under this tariff is very different from that hitherto in vogue, so that it is difficult to say just what the increase will be on any given kind of freight. But the new rates are known to be much higher than the old—in some instances four or five times as much.

This is the tariff as revised by the Joint Western Classification Committee, January 1, 1887. It divides all freight that may be shipped into ten classes, running from 1 to 5 and from A to E inclusive. Its object is to enable the present "short-haul" rates to be maintained undisturbed by the new law. Another tariff has been framed for submission to the Interstate Commission, but it may be 60 or 90 days before any action can be had upon it. This proposed tariff is much lower than the one agreed upon to go into effect on April 4th. Under a liberal interpretation of the law, the lower tariff could be adopted.

Of course, if rates are much raised, the competition by clipper ship and by Panama will come into operation, and much of our produce can go that way.

LARGE ENGINES.—An English firm is engaged in constructing large compound engines for the new Italian armor-clad *Il Re Umberto*. According to the contract, these engines are to be of 19,500-horse power, which is 7500-horse power more than that of any vessel yet designed for the British Navy. It is stated that they will actually indicate 21,000-horse power, or 9000 more than any vessel in the British Navy. These engines, completely made of steel, are expected to drive the *Il Re Umberto*, fully equipped, about 20 knots an hour.

LENSES which magnify, and yet are perfectly flat on both sides, have been constructed by Schott & Co., of Jena, the manufacturers of Abbe's optical glass. These lenses are mere curiosities. They consist of single disks of glass, such that the refractive index decreases in a regular manner from the surface inward.

See advertisement elsewhere "TRAVELING AGENTS WANTED."

MECHANICAL PROGRESS.

A Compound for Treating Steel.

A patent was issued in May last for what is called "Schaefer's Compound for Steel." The compound consists of resin, linseed oil, glycerine and powdered charcoal, heated and intimately mixed in the proportion stated in the specification. It is used by heating the steel to a clear red heat and immersing and coating it in the compound, and the steel is afterward reheated and hardened in the usual manner by quickly cooling it.

The *Journal of the Franklin Institute* refers to it as follows: "Barned cast steel is restored to its original condition, and the softer grades of steel acquire the properties of cast steel, by being treated as above stated. Tools made from Bessemer steel, which is incapable of being hardened, are, after treatment with this compound and hardening, capable of cutting cast steel."

Tools so treated possess a greater durability than before, and are capable of cutting castings which resist the best of ordinary cast-steel tools.

The grain of steel exhibited by fracture of tools so treated, as compared with the same material before treatment, shows a difference analogous to that between the fine cast steel and coarse or blistered steel.

The compound applied to gray castings and malleable iron castings imparts a degree of hardness to them superior to ordinary case-hardening.

It is not attended in use with the unpleasant and deleterious fumes incident to case-hardening compounds containing hydrocyanic acid, and is much less expensive.

Specimens of different materials in their normal state, and also as treated with this compound and hardened, were submitted to the members of the institute, properly labeled, which conveyed a clearer conception of the effect than could be stated in language.

In order that the facility of application and its effect may be seen, a forge, with fuel and bars of steel, and other metal and a supply of the compound, were submitted, by means of which the members who felt inclined personally tested it after the close of the meeting.

The compound has been introduced into practical use in many manufacturing establishments in this city, with uniformly satisfactory results.

The Double-Belt Question.

We recently gave a short paragraph from an exchange on the practicability and economy of using a double belt instead of a single wider one to secure any desired power. A correspondent of the *Mechanical News*, in alluding to the use of double belts, says: "In regard to running one belt on the top of another, the inside belt has to carry nearly all the load, the outside belt being only a tightener to press it against the pulleys. Both sides of the inside belt are subjected to about equal friction in carrying the load. However anomalous it may seem, the outside belt runs faster while going around the pulleys than the inside belt, occasioning some slipping between the two, in the direction to bring an undue strain upon the inside belt." In referring to a particular case the correspondent says: "Instead of his outside belt being 'a great deal the tightest,' it should have been a great deal the loosest. The outside of the outside belt (being of canvas and covered with rubber) wouldn't stretch while over the pulleys—its inside must upset in bending; consequently it was slipping ahead of the inside belt, occasioning its destruction as well as loss of power."

Still Another

Remarks as follows: "The power that is applied to the pulley has to be resisted by the inside belt adhering to the face of the pulley, and as it is three and one-seventh times the thickness of inside belt farther around the pulley for the outside belt to travel, and the outside belt has the outside grip and the power of the engine to help, it is natural to suppose that it will hang to that grip and stretch the inside belt three and one-seventh times its thickness every time round the pulley. All the mercy the inside belt can get is while it is passing from one pulley to the other, when it has to undergo the same process of stretching, which will make the best belt in the world yield in a short time, and the outside belt is of no use whatever, only as a matter of heft. The smaller the pulley the greater the strain in a given length of the belt; therefore I would not advise a double leather belt to be run on very small pulleys. It is better to increase the width, or even to run two sets of pulleys and use two single belts, than to have the belt too thick on small pulleys, for a pulley that is three feet in circumference strains the outside of a belt just as much in the three feet as one twice that size would in six feet."

LAST DAYS OF THE STEAM ENGINE, POSSIBLY—ELECTRICITY NEXT.—The steam engine has been coming in for some disparagement from the late discussions of the British Association. According to some leading members of the body, the steam engine has had its day; its part is played. It will before long, we are assured, be seen only at museums. It is needless to say, however, that the scientific men of the British Association do not speak lightly of the steam

engine for the same reasons which induce Mr. Ruckin to condemn and denounce it. Mr. Ruckin objects to all inventions and appliances which bring crowds of uncultured persons to interfere with the meditative seclusion of the cultured few, or the cultured one; which enables rude, inquiring tourists to roam over hillside and lakeside, and to "spoil for him the earth and skies." The scientific men object to the steam engine and talk lightly of it because they think it is not up to the work which the age requires; because it expends too much force with too little result. They want a better force than that which drives the steam engine; more locomotion, quicker motion, quicker travel, involving, of course, greater diffusion than ever of the uncultured among the scenes hitherto claimed by some as sacred to the cultured. For ourselves, we have no rooted prejudice in favor of the steam engine. We are quite willing that it should go, if only something better, swifter, safer and less noisy should come to take its place. It had its merits, undoubtedly, and was a very useful piece of mechanism in its day. But if its day be done, we are quite ready to welcome the coming guest and speed this parting one to its place in the South Kensington museum.—*Ex.*

Iron and Steel vs. Wood.

At a late meeting of the South Staffordshire (Eng.) Institute of Iron and Steel Works' Managers, a paper was read by one of the members, entitled: "Some Suggestions for the Development of the Iron Trade by the further use of Iron and Steel vs. Wood." The paper contained several hints which might be profitable for consideration in this country as well as England. It explained that every ton of iron or steel which could be used in lieu of wood must be a great saving or gain to the country. Iron practically represented so much labor expended. Without going into close calculations, it was reasonable to say that one ton of iron, at £5, meant £4 or more actually paid in wages. It was, of course, an undoubted fact that there had been in the past a great development in the iron trade by the gradual use of iron instead of wood, and there was, no doubt, a very large field still open for further substitution, such, for instance, as in buildings, boxes and packing cases, barrels or casks, carriages, carts and other vehicles, furniture, farm buildings, fencing, pit frames, railway work, sheds, signal-boxes, telegraph poles, etc. With regard to buildings, much had been done by the adoption of girders, beams, pillars, shutters, etc., to say nothing of the numerous forms of galvanized iron buildings; but there must still be room for inventive brains.

Our neighbors in France had recently invented hollow iron window frames and doors—which were said to be light and strong and of greater durability than could ever be predicted of wood. Some few years since an attempt was made with a patent metallic box for tin plates, but owing probably to some defects it was never adopted. If a suitable sheet-iron box could be generally used, it was estimated that the consumption of iron in boxes to cover our present output of plates would be something like 10,000 tons a year. In such a box or cover there would be advantages to foreign if not to home buyers, for it was well known that wooden boxes arrived in foreign ports in a very bad condition, and could only be used for firewood, whereas iron, in the shape of pieces of steel or scrap, was always salable. Iron barrels or casks were largely used, but here again was room for extension and development. There was no reason why corrugated barrels of iron or steel should not be used for liquors, since milk and preserved fruits, and other articles of food, were kept in cans. Steel was finding much favor among the carriage-builders, but there was still much prejudice against the metal being used in the manufacture of furniture. Iron was already extensively used for fencing, and it was hoped that when the railway companies renewed their miles of fencing they would substitute iron or steel for wood.

The general adoption of steel sleepers would certainly do good, as would also the employment of iron and steel in the manufacture of railway wagons. There were, indeed, a few plate-iron trucks in use, and there were several important advantages in their construction which might well be considered. It was noticeable that even in the present day of galvanized-iron buildings our railway companies still erected wooden sheds, signal-boxes, etc., which might be both profitably and economically substituted with iron.

MANUFACTURED IRON.—There appears to be no abatement in the demand for some forms of finished iron, and at no time since the war has there been such a demand for bar iron as at present. The mills are receiving inquiries from quarters heretofore never supplied by them, showing that the usual sources of supply are all overcrowded. Structural iron is also in fair demand. Dealers say that the prospects for a prosperous spring and summer trade in building forms of iron grow better every week, as the difficulties between the building contractors and their men are being rapidly settled up. Tank and plate iron are being called for in large quantities from nearly all quarters.

THE STRENGTH OF NAILS.—Experiments have proven that a nail is able to lift and draw, perpendicularly, nine times its weight. It will drag, horizontally, on a smooth surface of wood, 50 times its weight.

SCIENTIFIC PROGRESS.

How the Thistle Travels.

There is no weed more ubiquitous than the common thistle. In paradise, it is true, if we may trust John Milton and the Sunday-school books—wise, as usual, beyond what is written—there were no thorns or thistles, the creation and introduction of the noxious tribe upon this once innocent and thornless earth being a direct consequence of the fall of man, and a stern retribution for Adam's delinquency. But since then the thistle has managed so to diffuse itself over the habitable globe that there hardly now remains a spot on earth without its own local representative of that ever intrusive and conquering genus. Wherever civilized man goes, there the thistle accompanies him as a matter of course in his various wanderings. It adapts itself to all earthly environments. Close up to the Arctic Circle you find it defying the indigenous reindeer with its prickly wings; under an equatorial sky you may observe it accommodating itself most complacently, with a sardonic smile, to tropical existence, and battling with the prickly cactuses and the thorny acacias, to the manner born, for its fair share of the dry and arid uplands. Even natterles are nowhere in competition with it; in spite of its valuable and irritating sting, the nettle has not the plasticity and adaptability of constitution that mark the stout and sturdy thistle tribe. Garnered and harvested yearly with the farmer's corn, its seeds have been gratuitously distributed by its enemy, man, in all climates; and, when once it gains the slightest foothold, its winged down enables it to diffuse itself ad infinitum through the virgin soil of yet unconquered and untithed continents. A field of thistles in England itself is a beautiful sight for the enthusiastic botanist (who has usually a low opinion of the agricultural interest); but in the fresh and fallow earth of New Zealand they attain a yet more prodigious stature, that might well strike awe and dismay into the stout heart of a Berkshire farmer.

The fact is, this thistle is one of those bell-cose plants which specially lay themselves out, in the struggle for existence, for the occupation of soils, where they are compelled to defend their leaves and stems from the constant attacks of the larger herbivores. On open plains and wide steppes, much browsed over in the wild state by deer or buffalo, and in the degenerate civilized condition by more prosaic cows and donkeys, one may always note that only the prickliest and most defensive plants have any chance of getting a livelihood.—*Popular Science Monthly.*

TASTE AND SMELL—TWO SENSES, EACH USELESS WITHOUT THE OTHER.—Scientific men inform us that we can distinguish only some six varieties of substances by taste. These are the bitter, sour, sweet, saline, alkaline and metallic. Others enumerate simply the sweets and bitters, acids and salines as the four varieties of flavors we are able to distinguish. The rapidity with which different substances may be perceived and appreciated by the sense of taste varies greatly. For example, salt ranks highest on this list. It can be tasted in 0.17 of a second after its application. Quinine, with a much more persistent flavor, requires but 0.258 of a second for its appreciation by taste. Bitters do not rank highly in this matter of food appreciation. Sours and sweets come certainly within the range of taste. We have acquired a habit of referring every sensation about the mouth to taste, whereas, in reality, it is argued by the *London News*, smell has more to do with the matter than is really believed. Even in the case of sweets and sours, it can hardly be denied that these are to be distinguished more by a combination of smell, taste and touch than by taste alone. Again, we discriminate degrees of coarseness by smell in a ready fashion, and such degrees may be tested and distinguished by the more delicate smell when taste lags woefully behind in the work of discrimination. Perchance it is the pure sweet savor that taste has the right to assume as its especial province. Yet "lengthened sweetnes long drawn out" will soon weary the palate unless it is linked to some other flavor in the distinction of which smell may play a part. Children will weary of plain sugar, while the flavored candy attracts them more powerfully; and this is a proof of the argument that it is to smell and to its aid in tasting that the higher sense of gratification is due.

FREEZING MERCURY IN A RED-HOT CRUCIBLE.—We take from an exchange the following account of an experiment recently performed at the University of Wooster by Prof. W. Z. Bennett: Carbon dioxide was generated in a cylinder of Bessemer steel under a pressure of 3000 pounds to the square inch. From thence it was allowed to escape into a condenser in the condition of solidified gas, resembling snowflakes in appearance. The temperature of this solidified gas is 168° Fah. below zero. A small quantity of this gas was then gathered and pressed into a so-called "snowball," on one side of which was a small depression. The ball was placed in a red-hot crucible, upon which the intense heat of a Bunsen burner was playing. A little mercury and ether were dropped into the depression on the "gas ball," and notwithstanding the intense heat, the mercury was immediately frozen. Professor Bennett then advanced one step higher by setting the

ether on fire, but still was enabled to pick out the frozen bulb of mercury. An instance of this last step in which mercury was frozen in a flame, as well as over a red-hot crucible, has never been recorded in science, and was perfectly original with Professor Bennett.

Economy in Gas Consumption.

A very important consideration in burning gas, affecting safety as well as economy, is in securing a uniform pressure at the burner, and a pressure which scientific research has established as the most economical. Without a special regulator, uniform pressure is impossible, as the pressure varies with the number of burners drawing from the main, which number is constantly varying. The elevation of the burner, whether at the top of a high building or in the basement, is also an important factor in the pressure.

A decrease of pressure in the gas company's mains is an important economy to the company, as the lowest pressure is attended with the least loss from leakage. The general average of leakage from mains is about 17 per cent of the gas made. A five-foot burner will consume, under a half-inch of water pressure, seven feet per hour; under a one-inch pressure the same burner will consume 11 feet per hour; under two inches 16 feet, and under three inches 20 feet. From these figures the reader will readily see the loss or gain in gas consumption from variations of pressure.

The point of pressure which scientific investigation has determined to be the most economical is half an inch, when the piping is properly put in and arranged. Perfect regulation is claimed for a great number of devices—for all, indeed; but none of these devices do it for any considerable length of time. When first put in and tested they generally do all that is claimed for them; but after the gas has passed through them for awhile a sticky sediment is formed upon the self-regulating valves which prevents their proper working. No matter how perfectly made and finished, they will get "sticky" and won't regulate; and as a general thing the finer the valve-seats are finished, the quicker and the worse they will stick. This gas tar, as it is called, is what plays the mischief with the regulators. Frequent cleaning is the only remedy. If you decide to buy a "regulator," insist on having it tested, and don't let this test be made until it has been used for five or six days at least. There is quite a difference in the working of different regulators. Some are, beyond question, much better than others, and good judgment and careful tests should be made as above before final purchase. A good regulator that works fairly well and is frequently cleaned, will undoubtedly make an important saving in the ordinary burning of gas.

PENETRATING POWER OF LIGHT.—If it were possible to rise above the atmosphere which surrounds the earth, we should see nothing but an intense and sharply defined ball of fire, while everything else would be wrapped in total darkness. There could be no diffusion of light without an atmosphere or some similar medium for it to act upon. This would undoubtedly be the case to an observer on this moon. The moment the "sun goes down," upon the moon intense darkness prevails; there is no twilight there, because the moon has no atmosphere. If the air around us upon the earth extended to a height of 700 miles, the rays of the sun could not penetrate it, and we would be left in darkness. At the depth of 700 feet in the ocean the light ceases altogether, one-half of the light being absorbed in passing through seven feet of the purest water.

BALLOON ELECTRIC SIGNALING.—In a paper just published in *Nature*, Mr. Eric S. Bruce, the English inventor of the balloon for signaling by the electric light, announces that he will soon put his invention to the most rigorous of tests—signaling across the English channel at Dover. Mr. Bruce's balloon is made of a perfectly translucent material, filled with hydrogen or coal gas, in the interior of which are placed several incandescent electric lamps. The lamps are in metallic circuit with a source of electricity on the ground. In the circuit on the ground is an apparatus for making and breaking contact rapidly, and by varying the duration of the flashes of light in the balloon it is possible to signal by the Morse or any other code.

TEMPERING BRASS.—Brass cannot be tempered in the manner in which steel is tempered. Hence the only method to make a brass spring is to compress the metal either by roller or by hammering. If the springs are to be flat, hammer them out to shape from soft wire or sheet brass somewhat thicker than the finished spring is to be. If the brass shows a tendency to crack in hammering, it must be annealed, which must be done by heating to a light red and plunging into water. In hammering, use a light hammer, but do not spare the blow.

A BOTANICAL phenomenon in which the people of Leominster, England, take pride is a pair of trees—an oak and an ash—which appear to have but a single trunk. They grow together for about four feet and then divide.

COMETS.—According to Prof. Young, 600 comets have been discovered since the beginning of the Christian era.

ENGINEERING NOTES.

New Cable System for Street Railways.

What is claimed to be most successful experiments have recently been conducted in Chicago with a new cable system. The following sketch of the system is taken from a recent issue of the *Chicago Times*:

The cable is carried in a 6-inch square slotted tube or box of iron, which rests on the same cross-ties that the outside tracks are placed on, thus, of course, doing away with all street excavation, as this tube merely takes the place of a small section of the pavement. The cable rests on and is carried by two-wheel trucks 9 feet apart, which move on two small parallel tracks inside of the tube. At regular intervals between these trucks there are what may be termed huttons, 3 inches in diameter, which are rigidly placed on the cable. In connection with the trucks, and which revolves with them, is a small steel brush which constantly keeps the tube clear of any snow, water or other foreign substances which may enter the slot. This is conveyed to receptacles at regular distances along the line, generally near the intersections of streets, where communication is had with the sewer, and consequently the tube is always free. At the engine-house a large horizontal drum, provided with indentations in which the huttons enter at regular intervals, is connected with the power plant, and steadily, firmly and positively moves the cable at the required rate of speed. In case of any possible mishap, subjecting the cable to any extreme strain, the drum moves out of gear and the engine runs loose, the engineer shuts down, investigates and remedies the trouble. This is in marked contrast to the breaking and filling up of the immense conduits now used with the cable.

The cars used are ordinary horse cars, with an addition possibly costing \$50, consisting of what is termed a sprocket or forked wheel, which can easily be elevated to the bottom of the car by the driver stepping on a lever. The forked wheel when in place extends into the slotted tube, where it comes in contact with the huttons previously mentioned. This wheel revolves as the huttons pass when the car is standing still. The driver, by turning his brake-handle to the left, slowly causes this forked wheel to become rigid, which necessarily starts the car slowly and without any disagreeable jerk. The action of stopping is the reverse—the moment the driver turns the brake-handle to the right, releasing the forked wheel from its rigidity, any further movement applies the brake to the wheels and the car is quickly stopped. It may here be stated that the driver occupies the same position on either platform, and his movements in starting and stopping are precisely similar to those in present use. By a close estimate it is calculated that the cost of cleaning out manholes, the wear and tear of the present cable system, and the attention it has necessarily to have will amount in Chicago to some \$3000 per mile per year. This, of course, is in excess of the interest on the original investment. This \$3000 per mile annually, being the interest on \$50,000 at 6 per cent, would construct 5 miles of the street work of the Rasmussen system.

REFORM IN HEATING RAILROAD CARS.—The necessity of devising some safer and practical system of heating and lighting railroad cars than has heretofore been used has long occupied the attention of engineers. This inquiry has been greatly intensified by the late terrible casualties which have culminated in such fearful destruction of human life from fires kindled by stoves and lamps. It is encouraging to note the great activity and interest which has been recently developed in this direction. Steam heating, direct from the locomotive, is fraught with so many practical difficulties, that it can hardly be brought into general use. The latest, and the apparently most practical idea, is to provide a special steam-generating car, which can be at all times connected with the train, and regulated according to circumstances. Several different experiments are now in progress on various Eastern roads, out of which it is confidently expected some thoroughly practical and safe plan will be devised. A thorough reform in this direction is imperatively demanded, and if railway companies will not, of their own accord, soon introduce some other plan than coal stoves and kerosene lamps, the reform should be hastened by legislative action.

OSCILLATION OF CHIMNEYS.—The amplitude of the oscillation of chimneys has been exactly measured by observation of the shadows cast by the sun upon the ground. Recently the oscillations of a chimney 115 feet high and 4 feet in diameter, externally, at the top, near Marseilles, France, were observed by the shadow during a high wind to attain a maximum of 20 inches. It was estimated that the chimney, deflected by an initial impulse, would have made four or five oscillations before returning to a state of rest. On the contrary, by a succession of impulses isochronous with the oscillations, a chimney may finally be overthrown. Such is the explanation of the destruction of certain chimneys in which all the conditions of statistical stability were fulfilled.

TELEPHONING between New York and Philadelphia is now as easy as it was between points a block apart a few years ago.

USEFUL INFORMATION.

Insect Powder in Liquid Form.

A method of employing insect powder in form of alcoholic extract is the most advantageous for use in fields and garden.

The principal drawback connected with the use of insect powder is this, that its effect, when applied in substance, is only certain when it comes in actual contact with soft-bodied insects. In the case of hard-bodied or haired insects it often produces only stupefaction for a time. This drawback is to a great extent removed by employing the alcoholic liquid extract, which may be prepared by percolation, or, according to the author, by macerating one pound of insect powder for four or five days with two pints of alcohol in a warm place, then separating the alcohol and adding one pint of glycerine. This liquid extract is to be diluted with water before use. For hard-bodied insects it may be diluted with 20 parts, for more sensitive insects with 30 to 40 parts of water. If it is to be used out of doors, it is self-evident that it should not be applied while rain is threatening, nor during the hot part of the day. The best time is early in the morning while the dew is still on the ground, or during cloudy days.

If a decoction of insect powder is desired, this may be readily made by pouring boiling water upon it and macerating in a covered vessel until cold.

In many cases a single mixture of insect powder and water will be found quite effective. A good proportion is, according to the author, one-half ounce to two gallons. [This seems to be altogether too weak.]

The decoction, however, is much more effective. It must be used as soon after preparation as possible, and at a time when its effect will not be interfered with by the condition of the atmosphere.

It should be stated that the majority of insects do not die immediately after having come in contact with insect powder or one of its preparations. They are at first only stupefied, but death usually comes after a few hours, and in some cases not until after several days.—*Drug Reporter*.

CLAMP FOR STOPPING LEAKS IN PIPES.—A clamp has recently been patented which must be particularly valuable and convenient in dwellings wherever water-pipes are used, as well as for engineers and plumbers. The invention consists of a clamp which has an opening in one side of sufficient size to allow the clamp to be readily placed upon a pipe. In the interior of the clamp, at one side of the side opening, is formed a recess to receive and fit upon the side of the pipe. In the interior of the clamp, at the other side of the side opening, is formed a groove or recess to receive a key. In using the clamp it is placed upon the pipe with the recess upon the side of the pipe opposite the aperture to be closed. A pad of leather, copper, rubber or other suitable material, is placed upon the pipe over the aperture; a saddle, having its inner side concave to correspond with the curvature of the outside of the pipe, is placed upon the pad, and the key is driven into the groove along the outside of the saddle. The saddle and key are tapered in opposite directions, so that the saddle and pad will be forced down squarely upon the pipe by driving the key into the groove, which will securely close the aperture. This simple invention must be very convenient for use in emergency, if at no other time, while waiting for a plumber. It is applicable to steam as well as water-pipes. The inventor is Wm. W. Knight, of Jersey City, N. J.

A CURIOUS HEATING APPARATUS has been discovered and devised by Prof. Morse, of Salem, Mass. It is a most interesting and practical method of utilizing the sun's heat for "artificial warming." The device consists simply of a shallow box, the bottom of which is corrugated iron, and the top of glass. This is placed outside the building in such a position that the sun shines directly upon it, the heat rays of the sun pass through the glass and are absorbed by the iron, heating it to quite a high temperature, and, by a system of ventilation, a current of air is passed through the apparatus and into the room to be heated. By this means the air was heated on pleasant days to about 90 degrees by passing over the iron. Rays of the sun are also utilized for motive power by the illustrious Swedish-American engineer John Ericsson, who is now in his 84th year—and he is said to be working in his shop ten hours daily, the "sun motor" having been his chief object of study and experiments for the last 20 years.

DURABILITY OF ZINC.—In Dr. John Percy's book on Metallurgy, published by John Murray, of London, in 1861, page 531, it is said that at the ordinary temperature zinc is not acted upon by dry oxygen; but when exposed to moist oxygen or atmospheric air its surface acquires a compact, tenacious gray coating of hydrated oxide, which impedes the oxidation of the subjacent metal. In this respect the rust of zinc differs much from the rust of iron, which, instead of impeding, seems rather to accelerate the oxidation of the subjacent metal. By the conjoint action of moist oxygen and carbonic acid, zinc is converted into a hydrated carbonate. The roofing from which the specimen analyzed was obtained had been exposed to the

atmosphere of Munich for 27 years. Pettenkofer ascertained that during that period 3.831 grammes of zinc per square foot (Bavarian) had been oxidized, and that nearly half of the oxide is carried off by rain. Hence he estimated that a layer of zinc only 0.005 of a line (a line is one-twelfth of an inch) in thickness requires, in the atmosphere of Munich, 27 years to be entirely corroded; so that, leaving out of consideration the oxidation of the lower surface, which may be practically disregarded, a zinc roof of one-quarter of a line (equal to one-fortieth of an inch) in thickness would be completely corroded in 1243 years.

SHAFTS AND BELTS.—In the location of shafts that are to be connected with each other by belts, care should be taken to secure proper distances one from the other. A general rule may be stated, thus: Where any belts are to be run over small pulleys, 15 feet is a good average. If larger belts, working on larger pulleys, a distance of 20 to 25 feet does well. Shafts on which very large pulleys are to be placed for main or driven belts should be 25 to 30 feet apart. Nothing can be more expensive to a user of belts than a poor lacing. The best is the cheapest.

REMEDY FOR RATS.—A writer in the *Scientific American* says he cleared his premises of rats by making whitewash yellow with copperas, and covering the attics and rafters in the cellar with it. Into every crevice which a rat might go, he put the copperas and scattered it in the corners of the floor. The result was the complete disappearance of rats and mice. Since that time not a rat or a mouse has been seen near the house. Every spring the cellar is coated with the yellow wash as a purifier and as a rat exterminator, and no typhoid, dysentery nor fever attacks the family.

A PAPER CHIMNEY.—A large factory of Breslau, Germany, required a chimney 54 feet in height. Instead of constructing the chimney with bricks, as usual, a large number of solid blocks of paper firmly compressed were made use of. These blocks were placed carefully one on the top of the other and joined together with a special cement. The chimney is non-inflammable, is very elastic, and is by the nature of the material quite secure from lightning, which so often plays such havoc with the more ordinary sort of factory chimney.

ADVERTISE.—This word is traced back to the early part of the fifteenth century; but in those times it was used in the sense of advert as well as in that of inform. In the seventeenth and eighteenth centuries it was uniformly pronounced with the accent on the middle syllable, advertise; subsequently, advertise became universal; the present tendency, says Dr. Murray (in commercial usage, at least) is to say advertise, apparently after the verb in use.

ERASING LINES.—Sometimes the draftsman wishes to erase a line without removing other parts of the work or damaging a line which cuts the line to be removed. In the above case, lay a sheet of paper upon the line it is desired to save, and with an India rubber eraser the desired line can be removed, and you can work clean and sharp to within one one-thousandth of an inch of the parts desired to be left.

GOOD HEALTH.

The Cancer Discussion.

The cancer discussion, which has been originated in these columns, seems to be creating quite an interest, not only in this city, but in various distant parts of the State as well.

We would take this occasion to make one more serious appeal to the medical profession at large to inquire into this matter. Some of them are already doing so. To all who so desire, every reasonable opportunity will be given to meet with persons who have been cured by our specialist after passing through the hands of the regular faculty, and, in many cases, after submitting to one or more operations. Inquirers will also be afforded the opportunity to visit patients now under treatment, and, if they see proper, to place special cases of their own under treatment, with the fullest privilege of watching and noting results. With very few exceptions, the only thing we have thus far heard from gentlemen of the profession has been "You are only advertising the woman." This, we need hardly state, is very remote from our object, which is simply "to court investigation."

We had hoped, as already stated, to have kept the investigation within the body of the medical profession, and thus have avoided all newspaper discussion, but the action of the Medical Society of this city in most positively declining to investigate certain cures of cancer, or so-called cancer, has left us no alternative but the one we are now pursuing until the public, if not the faculty, are fully satisfied by the accumulation of evidence that cancer can be cured, or the reverse. Inasmuch as the public has from time to time loved to demand a cure, be it possible or impossible, for every disease, thus assuming that doctors of medicine should be infallible, and for reasons of a personal nature already expressed, the writer feels it a duty to make this appeal in the interest of humanity and for the welfare of the public, and more especially of those suffering ones so often said to be "hopelessly diseased." Protecting

such from ignorance or lack of skill, whether it proceeds from quackery or any other source, as well as seeking every other method for their relief, is the palpable and only rational course open to this true professional man or woman.

From letters received the past week in regard to this matter, we give the following one entire, as it appears to have been called out by what has heretofore been said in these columns, and is entirely unsolicited. We regard the cure as a very important one, and as the case is one of long standing it affords good evidence of the fact that the cures are genuine and do not return, as is the case with 19 out of 20 who submit to the knife. The letter is dated Chico, Butte Co., March 15th, and is addressed to the editor of this paper.

DEAR SIR:—I take this opportunity of writing to you about a sickness I had six years ago. I had been troubled with female disease for several years, and was treated by several of the leading M.D.'s of the State, and among the number Dr. John Scott, of San Francisco. When, six years ago, a hard bunch formed on the uterus, I employed Dr. Max Werder, of 36 Geary street, San Francisco, who treated it for six months. I continued to get worse all the time. I then went to see Dr. Blake for advice. He told me it was cancer and advised an operation immediately, as he said I had no time to spare. I then saw Dr. Werder again. He then told me he believed it to be cancer, but did not advise an operation; said it would be far better for me to let nature take its course; if I did, my sufferings would be far less. He told me that he would like me to go and see Dr. Fraser, of Kearny street. I did so. He told me the only thing that could be done was to remove the entire organ. Of course I did not feel inclined to have that done, and came to the conclusion that if I must die I would die a natural death.

Just at that time my landlady came to me, saying she had learned of —, who made cures a specialty, and advised me to try and find her. Early next morning, I called again on Dr. Werder. I told him what I had heard in regard to —. He had also heard of her, and advised me to go and see her; said, "It is your only chance." I did so. She told me she could cure me if I had had no operation performed. I said no, and placed myself in her care on the 18th of July, 1881. On or about December, she pronounced me cured, and I have remained well of the disease ever since. When the cancer was nearly sloughed off, she sent for Dr. Werder, who came, and I heard him say, "Dr. —, when you cure that woman I will believe it, and not before." She said to him, "I am going to cure her."

When I was cured I went to see him. He told me that — had done a good job for me, and there was not another doctor in San Francisco that could do for me what she had done. All of the above facts are true. Yours respectfully, MRS. M. A. MCCARTHY.

THE SNEEZING SPOT ON OUR HEADS.—As a *Journal* representative sat in the chair of a Maiden-lane barber the other day, the genial artist of the brush observed that the journalist sneezed when his hair was combed. "Did I touch the sneezing spot?" inquired the barber. He then proceeded to explain that the "sneezing spot" was a sensitive place to the left of the middle of the forehead. "Why," said he, "there are men who come in here who sneeze regularly every time I comb their hair or shave them just as soon as the comb passes over that spot. I had a man in here yesterday who sneezed three times just as hard as he could, all because I touched the 'sneezing spot.' It must be a very small nerve that tickles the nostril."—*Albany Journal*.

[Just so, my friend; that is an example of sympathetic action between nerves; that comb irritated the brow-causing nerve, and made the nerve of smell to produce a sneeze. This the smelling nerve did by reflex action. It is a good example of sympathetic and reflex action of nerves.—Eds. Press.]

HOW TO PREVENT THE SPREAD OF SMALL-POX.—Although there is no contagion more powerful or certain, experience has taught that the spread of smallpox may be absolutely prevented by a strict observance of rules prepared for the protection of infected districts. On the first report of the existence of a case, systematic vaccination or revaccination of every person exposed should be at once resorted to. Whenever it is known that any person is sick with smallpox or varioloid, isolation of the individual should be promptly and rigidly enforced. Any accumulation of filth or refuse of any kind about our premises should be at once removed, and disinfectants freely used. A strong solution of copperas (sulphate of iron), alum—in the proportion of two or three pounds to a gallon of water, or combined with carbolic acid made by mixing eight pounds of dry copperas and a pint of carbolic acid in five gallons of water, and stirring the mixture briskly until dissolved, is good to disinfect all kinds of drains and foul places in houses, stables and yards.—*Ventura Free Press*.

TO DESTROY SENSITIVENESS.—According to Dr. Brown Sequard, one has only to harden the neck and feet and destroy their sensitiveness to prevent taking cold. This is done by daily blowing a stream of cool air, by means of an elastic bag, upon the neck, and by immersing the feet in cool water. The air is at first only slightly cool, but is each day made colder, until the neck can stand an arctic blast with impunity. The feet are immersed in water which is at first at a temperature of about 90 degrees Fahrenheit, and this is gradually reduced to 30 degrees Fahrenheit.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH STRIKE.—*Ledger*, March 19: As G. B. Ratto, of Irishtown, this side of Clinton, was plowing in his ranch last week, he turned up some quartz rock which on breaking was found to be plentifully sprinkled with free gold. Further research resulted in the discovery of a vein of the same kind about three feet wide. He has extracted some two tons of ore, and all of it is said to contain free gold visible to the naked eye. He has sunk on it ten feet, and it maintains its size and richness all the way down. Indeed, it is said that there is not a piece of rock in the whole pile taken out that does not show free gold. Samples may be seen at Ginoebio's store. Such rock is estimated to yield all the way from \$100 to \$500 per ton. The discovery is close to the claim now being operated by the McKenzie brothers. It promises to be a valuable find. The big tunnel at Middle Bar was closed on Monday last. All the miners were discharged, and the mouth of the tunnel closed. It is reported that the suspension is of a temporary nature. Rumors are afloat that W. A. Nevills is likely to be back before the first of April. It is also rumored that Captain Nichols is likely to return here, and take a hand in the management of the property, but whether these reports have any foundation we are not prepared to say. The most feasible explanation of the sudden cessation of work is that it is done to enable necessary repairs to be done to the drilling machinery, and that as soon as these repairs are completed, work will be resumed. Men are at work doing this repairing. The Amador gold mine has let a contract to sink the shaft 100 feet deeper. The price agreed upon is, we are told, \$17.98 per foot. This will carry the shaft 220 feet deep.

SUTTER CREEK.—Water was turned on at the Wildman yesterday to test the machinery, and everything was found to work like a charm, and gave entire satisfaction. The rope was put on today. The pump, which they have had to wait a few days for owing to the press of work at Knight's foundry, was delivered at the mine to-day, and mechanics are at work putting it into the shaft.

Butte.

MILLS.—*Oroville Register*, March 17: The time is fast approaching when Butte will be crushing vast amounts of profitable working quartz rock. At Oregon City one of the most perfect ten-stamp mills in the State has lately been erected on the Nesbit ledge. Of this Chas. Deiter is the efficient superintendent. The quartz is paying well; the mill is run on the most economical manner; the latest and most approved apparatus for saving gold has been introduced, and the ledge is thoroughly prospected so that we may expect this mill to do much toward showing outside capitalists that quartz mining in Butte is a paying business. Two quartz mills of ten stamps each are now pounding out the rich quartz of the Defiance ledge at Oregon City. McGrath & Matherson are proprietors of the mills, and everything wears a promising look about the premises.

Calaveras.

AROUND ANGELS.—*County Record*, March 15: The mines and mills in and around Angels are booming. Visiting the Nevell mine yesterday, we learn that stoping is being done in the 200 and 400 foot levels on the north end, the force of men having been taken from the south stope and placed elsewhere. The mill is running steadily on some of the richest looking ore we have seen from the mines for some months. The plates are looking well and we are informed the cleanup for last month exceeded those of the previous runs. At the Lane, things look lively. Stoping both north and south, on the 150 foot level. At the hoisting works everybody seems to be kept busy; the engine is on the go almost constantly, hoisting from 125 to 150 tubs of ore, and from 25 to 30 tanks of water each shift. The mill has lost but little time in the past two months. The plates are looking nicely, showing amalgam in quantities to suit the proprietors. The work of filling in the old works goes steadily on, there being a small force of men constantly laboring for the desired result. The Tozier is running steadily, both mill and mine; no cleanup has been made as yet, the mill having been running but about a couple of weeks. The Matson mill started up again last Thursday, and has been running steadily since the repairs were made. It is the intention of the owners to make a 35 days' run before they have a cleanup. The mill at the Waterman mine is kept running both day and night, and the plates are showing up as well as could be desired. Everything is in excellent working order and acts like a charm. Mr. W. W. Waterman, the proprietor, says that he can crush about 12 tons of ore in 24 hours. McCreight and Hardy are still drifting along the vein in their mine at Albany flat. They have not as yet worked through the chute. Rock from the Glass mine is being crushed at the Osborn mill, at Smith's flat. We are informed that the ore is very rich in free gold and sulphurets. More will be said about this mine in the future. Caster, Smith & Son are still pegging away on the North Star mine, at Bald bill. We understand that work has commenced on the new hoisting works at the Gillis mine, at Tuttle-town. New hoisting works are being erected on the Lillie mine at Kelley's gulch, owned by Lillie, Morehead & Co., of this town, the machinery having arrived.

GRAVEL.—*Calaveras Prospect*, March 19: Ed. Rigney is prospecting a gravel claim at Jimmy Hill's ranch on the Mok bill road. He has men employed clearing the ground of brush where he expects to work. A heavy casting in the gearing of the pump at the Sheep Ranch mine gave way on Monday last. A new one was telephoned for and work had to be suspended until the pump could be repaired. Several mines will soon be opened on Central hill, and the miners in that vicinity anticipate a boom in mining in that section this spring.

SHEEP RANCH MINES.—*San Andreas Citizen*, March 19: W. A. Henry brought to town again, last Sunday, specimens of ore from a mine in San Domingo region, owned by himself, Jas. Molloy, and Patsy Gallagher. The rock showed fine gold in profusion, and Mr. Henry claims there is an

abundance of it. It is about \$50 milling ore, so it is calculated. The pinion wheel of the pumps at the Sheep Ranch mine was broken on Sunday last. This will again suspend operations in the lower levels until a duplicate of the machinery can be obtained from San Francisco. This may take several weeks. The Hard Scrabble Co. is scrabbling as hard as ever to find the object of their investigations. They are making a good and thorough search. Quijoatao, Old Tom Smith, Smiley, Poor-man's Treasure, and other mines, that have yielded prospects, are at present inactive. Cause, presumably, a lack of capital to continue operations. The Woods mine at Indian creek will be started up as soon as the necessary machinery can be obtained for proper working. The creeks in this vicinity have been running lower than at any time to date for years. The outlook for the summer's supply of water is not yet encouraging. All mining operations are at present suspended in the Bonita gulch district. More prospecting will be done, however, during the approaching summer months.

El Dorado.

COLOMA TOWNSHIP.—*Placerville Observer*, March 19: The mining interests of Coloma township are now of little importance as compared to former times; placer and river mining having nearly ceased, except by the Chinese. During the rainy season, however, there are as yet a few white men engaged in placer mining, but most of the miners are prospecting for "pockets," of which some are occasionally found that pay well. There are a number of quartz lodes located, but few of them are worked. At the Hill lead mine, near Granite Hill, some work is now being done. McKenney & Wood, near Uniontown, are at work with an arastra on the old Stuckslager mine, and are meeting with fair success. H. Toehner, near Webber creek, is at work on his ledge, as is also John Gallagher, Kipp & Murphy. At Michigan Flat, a prospecting tunnel is being run into the hill, but so far we believe without success. The other claims are lying idle.

HENRY'S DIGGINGS.—*Mountain Democrat*, March 19: Miners are all getting ready to commence work in earnest. Armstrong and Roberts have commenced work in their tunnel, and will soon be taking out gravel again. Jeffreys has commenced work in the Cousin Jack mine.

GRANITE HILL.—Forni and Kune are engaged in erecting an arastra on their mine on Mt. Thompson, which promises to be a valuable property. They have sunk on the ledge to the depth of 30 feet. A. F. Anable and Alf Rogers have been prospecting a number of quartz seams, occasionally finding a pocket. Will Veerkamp and Line Gale have cleaned up a two-weeks' run on their surface mine, with handsome receipts.

Nevada.

RICH ORE IN THE NEVADA COUNTY MINE.—*Grass Valley Union*, March 15: A new pay chute has been opened upon in the Nevada County mine, at Nevada City, which promises to lead to a rich and important development. The find was made on Friday morning in the south drift on the 220 level, a few feet from the shaft, where in stripping the vein a ledge 12 inches in thickness was found on the footwall, which was highly sulphureted and rich in free gold. Several carloads of quartz were taken out during the day, in which there was a considerable quantity of rich specimen ore—nothing richer having been found in the district in years. The news of the strike created quite an excitement, and during the day several hundred people visited the mine to take a look at the specimens that were brought to the surface. The strike is considered important, as it is believed the drift will open up an extensive body of rich ore. In the north drift of the same level a different pay chute is being at present worked, the ore from which gives an average yield of \$40 per ton. The Nevada County is situated a few rods above the suspension bridge over Deer creek, the works being situated on the banks of the creek. Prospecting operations have been carried on for several years, and about \$20,000 have been expended on the plant and on underground work. The stock of the company is held principally by residents of Nevada City.

NORTH STAR.—Everything was running smoothly at North Star mine yesterday, with the water-power. The mill will run its full head of 30 stamps this week.

PITTSBURG.—The pumps of the Pittsburg mine are kept constantly going, the water being lowered at the rate of eight feet per diem. It will take about four weeks longer to pump the mine dry. The Pittsburg was compelled to shut down at the time of the snow blockade, and a large quantity of water accumulated in the mine.

THE DERBEC DRIFT MINE.—*Nevada Transcript*, March 15: For about six weeks past operations at the Derbec mine have been suspended as far as washing was concerned by the snowstorm blocking the ditches and cutting off the water supply. The employees have mostly stayed around there waiting for a resumption of operations. Quite a force of them are now engaged in cleaning out the ditch, and it is hoped the water will again be running by the end of this week.

NORTH STAR MILL.—*Grass Valley Union*, March 19: The new North Star mill is now ready to commence crushing ore, but it will probably be some time before it will be regularly at work, as the machinery being all new it is desirable to have everything running smoothly before the stamps are set agoing for uninterrupted service. The water-power has been on several times, and the machinery worked all right, but the pressure of the water has shown some defective places in the pipe-line which require strengthening. These, however, are but temporary drawbacks, easily remedied, and cannot cause long delay. A new pipe-line generally makes some leakage, and delay from that cause is looked for. The mill is a splendid one in all its appointments, having every valuable improvement known to gold-saving mills, arranged with particular reference to convenience and the cheap working of ores, and very strong and durable in its construction.

NUGGETS AND GOOD GRAVEL.—*Nevada Transcript*, March 19: H. B. Nichols has been doing some little work of late on his placer claim. During the winter his incline shaft caved and buried a pump. Mr. Nichols is cleaning out the shaft, and when this is accomplished he intends to sink on the lead. The dirt removed from the shaft is being washed, proving remunerative, and last Monday a four-ounce nugget of solid gold was found. One

weighing half an ounce also came to light. Much gold was taken out from this claim last year—over \$6,000 in fact. A still larger bonanza will probably be unearthed when the lead is more fully developed.

Plumas.

GOOD PROSPECT.—*Plumas National*, March 19: Messrs. Courtright & McDonald have struck a deep channel on the middle fork of Mill creek, near Quincy, that promises to be a valuable find. They have run a tunnel 150 feet, and sunk a shaft seven feet without finding bedrock. The gravel pays \$2 to the carload, and gets better as they sink down. The channel can be traced quite a distance, and is evidently an old river bed.

Sierra.

RESUMED.—*Mountain Messenger*, March 19: The Extension men at Forest City, after over a month's enforced idleness, have resumed work, there being abundance of water to run the blower. We are told that 16 ounces to 11 picks were taken out this week. The Buzan tunnel up the ridge, being run by the Bassler brothers, contractors for the company, is in 625 feet. Dennis Finane is pushing work rapidly in the South Fork. The North Fork lessees are gladdened by the rise in Oregon creek. In both these mines they expect to strike "solid ground" before long. Tyler Dudley is preparing to open up diggings down the creek, a short distance from town. The Ruby is reported as bolder up very well, a full force being at work during the whole storm. Mr. Morrow has returned to the Pilgrim mine, and active preparations indicate that work is soon to commence there again.

SIERRA QUARTZ LEDGES.—*Cor. Messenger*, March 19: Not in the history of Sierra county has there ever been so much prospecting for quartz as there has in the past year. The prospects for 1887 are brighter than ever, and a good outlook is expected from the famous mining district near Sierra City. Your correspondent had this summer an opportunity to visit these mines. The following are a few of the principal quartz lodes in that district: Wm. Casserly will crush rock from his ledge, in Van Slyke's mill, near Butcher Ranch, in the spring. The Cleveland mine is looking better as the main tunnel progresses. The mine is paying dividends every month. About 60 men are employed. Whitney & Co. are still at work in their mine near China Flat. The ledge is six feet wide and prospects \$15 per ton. A 10-stamp mill will be erected in the spring. The ledge owned by Schlesinger, Littlejohn & Mooney is looking favorable. The owners are deserving success in their enterprise. Wm. Swan & Co. are still pushing their main tunnel ahead. Two men are employed at present. The mine has a favorable outlook. Eli Wolford and others have a fine vein of ore in their lower tunnel, which is in a distance of 100 feet. A 10-stamp mill will be erected in the spring. P. Haven is going to open the Gold Lake quartz mine this summer. The Phoenix, Colombo, Marguerite and Keystone mines, which are at present idle, will resume operations by next summer.

Siskiyou.

PICK AND PAN.—*Yreka Union*, March 19: Pyle & McCook on Deadwood are crushing good rock from their mine. The A B C claim on Fox creek, owned by Andrews, Boye & Coggins, of South Fork, starts up this week. Hegler brothers have a splendid ledge on Humburg, and it is improving as work progresses. They refused an offer of \$7000 for the property last week. William McConnell has leased his Klamath river claim to a company of Chinamen who will work it this season. We hear that they have already taken possession. Hon. R. H. Campbell's hydraulic claim, in Quartz valley, started up Monday of last week with a full crew and an abundance of water. This claim has proved to be one of the best paying in the county, and it is believed that it will beat its record this season. Eastlick brothers at Oro Fino, commenced work in their claim last week, under favorable auspices, and expect to realize better pay than last season, when the mine astonished everybody. This claim is operated with a new kind of elevator, their own invention, and it works like a charm; is made of wood; is very simple. Wright & Fletcher commenced operations in their splendid paying Oro Fino mine last week, and they are jubilant over the prospect of a long and profitable season. Most of this week will be consumed in opening the mine, the alternate freezing and thawing spells this winter having caused the banks to cave at the spot where they left off last season. R. D. Stone informs us that the Fort Jones claim, Klamath river, will not be opened before the first of next month. Their head-dam withstood the recent high waters and a portion of their wing-dam remains. This is one of the largest river claims in the county and it will be worked on an extensive scale this season. Last year the company paid out for wages and supplies over \$10,000. The most valuable piece of mining property in the county is unquestionably the Steamboat mine, situated on McAdams creek. Through bad management, defective pumping and hoisting machinery was erected at an enormous expense which financially ruined some members of the company. Even then, those who were able would have successfully carried the enterprise through, had not dissatisfaction and dissension arose among the owners, and thus the most valuable mine in the county was shut down over three years ago. For the prosperity of our county we sincerely hope that the owners of this important mine will come to an agreement, or that the property will change hands. A million dollars has been taken from the creek bed just above this mine. The claim itself paid big when it was worked, but the frequent breaking of machinery permitted only short runs. It paid an ounce to the man every day that work was not interrupted. The new mining district on Knownothing creek, a tributary of the South Fork of Salmon, is beyond a doubt a rich field, and it is just beginning to attract outside attention. The ledges thus far discovered have proved rich and extensive. Two years ago Fred Radelfinger, of San Francisco, struck camp on the creek with the intention of prospecting. He had been over the same ground in 1872, while on a hunt, and picked up a piece of float which was rich with gold. After months of bunting he struck a ledge and later found three more. He was associated with B. Funk, a half-brother of Senator Hearst. They prospected the ledges thoroughly, and on finding that they would pay big, at once erected an arastra and commenced operations in earnest. Crushing enough to buy a five-stamp mill, Radelfinger went

below to purchase one and has just returned. I will be shipped over the mountain as soon as pack trains begin to run. One of their ledges, between slate and granite, is seven feet. It will require a concentrator to successfully work the ore from this mine. An assay from unselected rock gives \$140 in gold and about \$25 in silver to the ton. The other ledges owned by these gentlemen are not as large or so rich. Their principal vein of free-milling ore pays from \$80 to \$90 per ton. As soon as their mill is put up a large force of men will be worked. Their arastra is about eight miles up Knownothing creek from the mouth. Hansen & Co., and H. A. Clark, also have splendid paying properties in the same vicinity, and are running arastras.

Shasta.

BULLION.—*Redding Free Press*, March 19: As the result of three weeks' run, Conant took from the plates of the Uncle Sam mill something over \$2000. The battery was not cleaned up. Andy Fife has made a success of piping water across Spring creek to run his mill by water-power. He has not made a cleanup recently, but when he does, the indications are that he will have something good. Bassett, Stocks & Co. are still pushing tunnels on the Cressus mine on Squaw creek, and have a large body of ore on the dump. This ore is of low grade, but they expect soon to strike something worth mentioning. The Lower Springs Milling and Mining Co., of Salt creek, has been reorganized, and H. Lorentz and O. M. Loveridge, of Weaverville, Trinity county, are now members of the firm. Operations are now to be prosecuted vigorously. Prof. Connor and W. E. Fricke have a fine quartz prospect above Middle creek, and not far from the Paul mill. They have a tunnel in 57 feet, and expect to soon strike the main ledge. Several stringers of quartz encountered show very rich rock. The Redding Reduction Works have been running night and day upon ore from various mines. One lot from Litten & Bennett's mine, Igo, yielded splendid results. Ore has also been worked from Butterfield & Griffith's ledge on Olney creek; 50 tons from the Texas and Georgia, Old Diggings; ore from Scroggins' mine, Round mountain; and ore furnished by Jos. Gage, from Salt creek. The process seems to be the correct one for all kinds of ore, and the cheapness of working is really remarkable.

San Bernardino.

CALICO NOTES.—*Print*, March 19: H. Argall and Marcus Pluth have made a very rich strike in the Juanita mine adjoining the Oriental. They have sunk about 15 feet on a well-defined vein that fairly bristles with horn silver. They are much elated over their rich discovery and the indications are that the ore will hold out to some depth in its present quality. The ore averages 150 ounces to the ton. The location of the mine is most favorable, it being in the neighborhood of the Occidental, Garfield, Little V, Pinto, Comet, and other mines that have been worked with profit some time in the past, and are now sources of considerable wealth to the owners and lessees. A tunnel is being driven into the Waterloo mine in West Calico, starting on an adjoining claim owned by Dan Edwards. It is now in about 460 feet, and will intersect a shaft that is being sunk at a depth of about 230 feet. Chas. McKennon, Jesse Riley, and others, have the contract for running the tunnel. Ore is found in the Waterloo in all the openings and in immense quantities. Thirty men are at work sinking and drifting, and it is expected that about 50 more men will be employed in order to keep 30 or 40 stamps of the new mill in constant operation. The Harmonia mine adjoining the Waterloo, owned by H. B. Stevens, is showing up some fine ore at a depth of 100 feet. It is being worked by Greer & Blair, who have sunk a shaft to a depth of 100 feet, and have drifted 40 feet toward the ledge, which is a continuation of the Waterloo ledge. The ore is found in porphyry contact. The property has every indication of developing into a valuable and permanent mine. The Iron-clad claim, a few rods west of Calico, has been sold to the Barber Mill and Mining Co., by H. B. Stevens and Soule & Stacy. This claim will no doubt prove a valuable low-grade mine to the company, and is in addition to and in close proximity to their present promising group of seven or eight claims. The Comet and Pinto mines in East Calico have been a source of profit to the chloriders working on the same, several having cleared a few thousand dollars apiece during the past six or eight months. The claims are still looking well. The Barber Mining Co. is running a tunnel in the Silver Reef mine, and uncovering considerable ore of a fair grade.

Placer.

QUARTZ.—*Placer Herald*, March 19: The other day we saw a magnificent chunk of quartz belonging to Mr. Shurtleff, of Ophir, who took it out of the St. Patrick mine. The rock has a creamy appearance, and is filled with free gold. Mr. Shurtleff estimates the specimen to be worth about \$600. This mine, under the management of Messrs. Shurtleff & Robinson, has made a splendid record. Some sulphurets which they had sent to Reno to be reduced, yielded \$466 in gold and 50 ounces of silver to the ton.

Tuolumne.

WATER SUPPLY.—*Tuolumne Independent*, March 19: The water in the Tuolumne Company's ditch is now running in full supply, and will probably continue, barring accidents, until fall. The ensuing mining season promises to be more than usually active, both in gravel and quartz. As mining is essentially the backbone of this county, and must be our main source of prosperity until a railroad comes to develop other industries, the water supply is a question of vital importance. Without the Tuolumne ditch, this part of the county, at least, would soon show lamentable signs of stagnation and decay. Messrs. Wm. G. Long and Jos. Hampton have bonded the old Cardnell claim, at Tuttle-town, of Mr. D'Arbours, the owner, and will soon proceed to open the old works and develop the mine. The old shaft is down about 40 feet, and partly filled with water and debris; but these old and experienced miners will soon put the mine on paying ground. It is said that over \$300,000 has been taken out of this pocket mine, and it is believed that there is lots more deeper on the "shoot."

QUARTZ.—*Tuolumne Independent*, March 19: We propose to further boom our quartz mines in and around Sonora, Columbia, and all along the great pocket belt of Tuolumne. This is something tangible, as our mines have stood the test in years past of many a boom. Old Bonanza Hill is holding

good its record, and Bald Mountain is yielding up its golden treasure to the hardy miner at an enormous rate. There will be a renewed activity in quartz mining in the county the coming season. New mills are going up in various parts, which gives a healthy outlook to this branch of mining industry. There remains an extensive field open to the prospector, miles of unbroken and unclaimed ground, with, we may add, hundreds of undiscovered milling and pocket veins. The development of quartz mines in the county can be said to hardly have commenced. We say there are extensive tracts of unclaimed ground in the mining districts; and yet we wish to call attention to another important fact relative to agricultural patents covering lands where it is reasonable to suppose there exist rich veins of quartz and gold-bearing gravel, that such lands should be made available to the prospector, by mutual consent of the owners, upon reasonable and considerate terms, which practice would, of course, set aside all recourse to law, and both farmer and miner profit by the custom when once fully established and recognized by all interested.

NEVADA.

Washoe District.

SAVAGE.—Virginia *Enterprise*, March 20: On the 1200 level the drift from the Norcross side is still being pushed into the Savage ground. The drift is in a large body of quartz that shows some good ore. No. 2 west crosscut from this drift is in a distance of 13 feet, all the way in solid quartz with spots of good ore. The whole body of quartz carries some pay. They are now engaged in opening the ninth station level from the Curtis shaft, and thence will run south to meet the drift on the 1200 level which is coming north, as mentioned above, from the Norcross side. On the 800 level the south drift from No. 3 west crosscut continues in a fine body of quartz which gives low assays. Are now hoisting ore through the Curtis shaft, where it is being deposited in the ore-house. Since last report there have been stopped from the 500 and 600 levels 660 tons of ore, and 765 tons have been shipped to the Mexican mill, Carson river. Bullion shipped since last report, \$16,758.25.

HALE AND NORCROSS.—On the 1300 level the south drift is now into the Chollar ground a distance of 400 feet. On the 1200 level the south drift has been advanced 35 feet. No. 1 west crosscut on this level was extended 10 feet, and No. 2, 15 feet. On the 5th station level the west drift was continued 25 feet, and its face is now 20 feet distant from the shaft. The ground in the drifts to the southward on both 1200 and 1300 levels still presses on the timbers, causing extra work in chipping and replacing the drift timbers. A great amount of virgin ground has been stripped on all the levels from the 700 down to the 1300, which will soon be explored. This is all new ground of great possibilities. The management are rushing the big double drift on the 1300 level into Chollar ground at the rate of 60 feet a week. This drift will strike the old Chollar incline and will be productive of a fine circulation of air.

CON. CALIFORNIA AND VIRGINIA.—On the 1435 level have continued stoping out ore from the bottom of winze No. 2, 165 feet south from the south line of the Ophir mine. The ore shows no change. On the 1500 level the south drift was extended 16 feet; total length, 527 feet. The usual amount of ore has been hoisted and shipped, and the average assays will be about the same as last week, namely, \$35.

OPHIR.—On the 1065 level east crosscut No. 1 was advanced 34 feet; total length, 182 feet. From the end of the south drift west, crosscut No. 1 was advanced 35 feet; total length, 173 feet. On the 1300 level the northeast drift running into Ophir ground from the Consolidated California and Virginia mine from the Ophir south line was advanced 30 feet; total length, 165 feet. The drift running north from the Consolidated California and Virginia mine was extended 20 feet; total length from the south line, 86 feet. This drift has passed through streaks of ore which gave assays of our average value. The face is still showing ore streaks that assay about the same as last week.

ALTA.—Are running a drift west from the 825 level to connect with the winze down from the 725 level. The drift is out 150 feet, and it has yet about 350 feet to go to make the connection. The rock in the face is very hard. The raise in the Keystone on the line of the Alta and Beaton is up 16 feet above the 725 level. On the 725 level are running a drift north into Lady Washington ground. Are now in 460 feet, with the face of the drift in vein matter of a promising appearance. When this drift shall have been extended 40 feet further, crosscuts will be made both east and west.

GOULD AND CURRY.—On the 425 level the south-east drift from the main south drift was advanced 24 feet; total length, 126 feet. It is still showing low-grade quartz. On the 300 level from the up-raise the west crosscut was advanced 26 feet; total length, 98 feet. The face is in the old stopes exposing ore in small quantities. Repairs to the main shaft are still in progress between the 1100 and 1200 levels. The east crosscut, opposite the west crosscut on the 425 level, is in porphyry showing streaks of quartz of a promising appearance.

CHOLLAR.—The old Chollar shaft is now about entering the old incline 1000 feet below the surface. Air was coming through into the shaft from the incline yesterday for the first time. By this time the shaft has doubtless broken through into the incline. There will be strong upcast draft in the shaft. As regards what is being done in this mine from the Norcross side, see the report on that mine. Work has been resumed on the croppings at the Sharon shaft, where much good ore may yet be obtained.

CROWN POINT AND BELCHER.—No work is being done in the ore-producing sections of either of these mines. They will be started up with full crews of miners as soon as Superintendent Jones arrives from the Bay. He is daily expected. Repairs to the main shaft are still continued, and it is being put in first-class condition. This has long been a needed work, as the shaft had become pretty badly dilapidated by the much and rapid hoisting it has for many months sustained.

ANDES.—On the 200 level are still taking out some very fair ore. As yet are occurs in bunches. Some of the bunches are very rich, while others are

of low grade. The average, or mixture, is fair milling ore. This ore is being stowed away in the mine. It will be milled as soon as facilities can be found. On the 300 level are exploring in the direction in which the ore bunches are found on the level above.

OCCIDENTAL.—The usual progress has been made in the drifts and crosscuts in the upper tunnel level. West crosscut No. 2, on this level, shows ore giving low assays. Low-grade ore is being extracted from small streaks of quartz on the 100 level from the south drift from the north incline. There is nothing new in the workings on the lower level tunnel.

HAYWOOD.—This mine is now keeping the Thompson mill, Devil's Gate, steadily at work. The ore breasts are all looking well. The ore in the winze below the tunnel is constantly improving. In the past five months—during much of which time no ore was extracted for shipment owing to deep snow and bad roads—has been shipped over \$90,000 in bullion to San Francisco.

IOWA.—Tunnel A face is in soft vein material. South drift from the same tunnel is in a strong ledge of quartz. Air shaft sinking from surface to connect with A tunnel is following down ledge on its westerly dip in good-paying gold ore. North and south drifts from tunnel B are yielding, in driving, considerable fine gold ore.

BEST AND BELCHER.—On the 1500 level the northeast drift was advanced 10 feet; total length, 751 feet. Near the face of this drift an east crosscut No. 1 was advanced 38 feet. At a point in the northeast drift, 105 feet south from No. 1, crosscut No. 2 was advanced 12 feet, and the face is in vein material of the usual character of that found in the mine at this depth.

YELLOW JACKET.—All is going on well and smoothly. The daily shipments to the Brunswick mill, Carson river, average 150 tons, which is all the mill can work.

POTOMAC.—Good headway is making in the drift south from the Chollar line, on the 250 level. It is passing through a mixture of quartz, clay and porphyry. Crosscutting will presently be commenced. Large quantities of ore are stowed away in the openings of the mine, awaiting milling facilities.

SCORPION.—On the 300 level the east drift has been advanced 35 feet, and its face is now 120 feet distant from the shaft. The ground through which this drift is now passing is softer than heretofore and is working to better advantage.

JUSTICE.—Work is progressing as usual on the 250 level, and a considerable amount of paying ore is being obtained from the south drift, now being run from the bottom of the winze, at a depth of 370 feet.

SIERRA NEVADA.—On the 520 level south lateral drift No. 2 was extended 42 feet; total length, 459 feet. From near the end of this drift west crosscut No. 7 was started last week and is being advanced in vein material of a favorable character.

MEXICAN AND UNION CONSOLIDATED.—On the 1300 level the joint Union and Mexican northeast drift was extended 29 feet; total length, 596 feet. This drift is now 351 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 30 feet; total length, 275 feet.

UTAH.—On the 472 level the north drift from the main west drift was extended 44 feet; total length, 318 feet. The face is still passing through vein porphyry and quartz, the appearance of which has not changed since last report.

SILVER STAR.—The drifts north and south on the 100 level are in vein matter yielding fair prospects in free gold.

OVERMAN.—The usual shipments of ore are being made to the Vivan mill.

Cortez District.

FAVORABLY IMPRESSED.—*Silver State*, March 16: Professor Thomas Price, of San Francisco, who had been examining the Wenban mines, at Cortez, passed west yesterday. He is favorably impressed with the appearance of the mines and thinks they will be sold if the price is not too high. Professor Price is considered one of the best mining experts on the coast.

I X L District.

RICH ORE.—*Silver State*, March 15: George Lovelock, Jr., left for Salt Lake City yesterday with 21,000 pounds of ore from his mine in I X L district. The ore averages \$350 to the ton, and he says there is plenty of it in the mine.

Gold Run District.

HAULING ORE FOR SHIPMENT.—*Silver State*: Judge Bounfield says teams are engaged in hauling ore from the Great Republic mine, in Gold Run district, to Golconda, and two men are at work at the mine sacking the ore, a carload of which will be shipped to Reno at an early day. The roads are bad and there is considerable snow at the mine, which interferes with operations.

Rebel Creek District.

RICH PROSPECTS.—*Silver State*, March 19: The heavy snowstorms of February somewhat retarded mining operations in this district during their continuance, and afforded a rest to many of the old timers here, who have been, so to speak, unemployed at work for a long time to bring the camp to the front. Proofs of the richness of the camp are manifest to the most casual observer. Large ledges containing rich ores may be found from one end of the district to the other. Owners of claims are sanguine of a near and prosperous future. With the departure of the snow, which is all gone from the foothills and most of the higher peaks, miners are resuming work and bending their energies to the further development of the numerous claims unearthed within the district's extensive area. Present appearances and preparations augur well for an active and profitable season. Many of the lodes discovered carry free gold, and some exceedingly rich and beautiful specimens are exhibited, notably those from the claims owned respectively by Raabe & Jones and the Choate brothers. The latter-named gentlemen are constructing a couple of arastras, which are on the eve of completion. They will have jointly, capacity to reduce three tons of ore per day, and will be run by water-power. Work still continues at the famous Ohio mine, and it is reported that the Golden Era and Great West mines may soon pass into the hands of Utah capitalists. These properties are pronounced very valuable and are

owned by H. H. McCollay. Salt Lake mining men seem alive to the importance of securing properties in this richly mineralized zone.

Robinson District.

BULLION.—*Pioche Record*, March 15: From a reliable source we learn that the mine at Robinson district, owned by Mr. Fetterson, has produced \$30,000 since last fall, and during the past two months the product has been \$10,000. The ore is shipped to the Eureka Consolidated Works for reduction.

Union District.

CINCINNATI CO.—*Belmont Courier*, March 19: The mines owned by the Cincinnati Co., Union mining district, will soon be added to the list of bullion producers. These mines yielded some very rich ore in the early days.

ARIZONA.

MOHAVE COUNTY.—*Miner*, March 16: John Buckley sent over a couple of tons of lead ore from one of his claims near Chloride. Ore is coming into the sampling works more freely than at any time during the present year. Wm. Brandon brought over 1½ tons of ore from the Pennsylvania mine on Thursday, which went very well. Tom Burch brought up nine sacks of very rich ore from the Hibernia mine, Cedar district, but has not had it worked yet. The sampling works were busy yesterday and this morning putting through 10 lots of ore from Prescott, about two carloads in all. George Mendez had four tons of ore from the Illinois mine worked last week, and George went home very well satisfied with the pecuniary result. Michael Labrosse brought over 1200 pounds of first-class ore from the Independence mine at Chloride, of which he has a portion leased, which went over \$800 to the ton. He also had about half a ton of second-class ore which worked over \$200. Messrs. Potts and Kenney were in town for a few hours last Sunday from Wallapai mountain. The claim they are working on is one located by Gus. Gatewood some 12 or 15 years ago, and from which he took out several sacks of ore that milled over \$4000 to the ton. The claim is now owned by Mr. Potts, who is trying to find another pocket of the same kind of ore. John Burt is in town from the Congress mine, Cedar district, and informs us that he has a pack train at work hauling ore from the mine to Owen's Spring, from whence it will be hauled to Yucca station and thence by rail to Kingman. Mr. Burt has a large body of ore in sight, and can take it out faster than he can get it packed over the mountains. He expects to keep an eight-mile team at work between Owen's Spring and Yucca.

COLORADO

CRESTED BUTTE.—*Elk Mountain Pilot*, March 19: Prospects of an early season as well as a prosperous one in our camp are now well assured. There is less than one-half the amount of snow on the mountains as usual at this season of the year, and ore-packing will begin in April or early in May. The superintendent of the Augusta mine writes that they want to put in a "big season's work," which means the putting in the new cable to the tramway, and running down the thousand or 1500 tons of ore now on the dump, the building of a mill to treat the same, the putting on of a large force of men at the mine, taking out the large bodies of ore now exposed, and sending it down along the iron cable. The output of the Augusta this season is estimated to be from 4000 to 6000 tons of ore from the 1st of June to the 1st of January. Hoisting works will likely be put up at the mine and the necessary buildings for continuous winter product of the mine. The Excelsior will produce perhaps three or four times the amount of ore ever mined any previous year, as we understand that a large force will be put on as soon as the packing begins. The extension of the Excelsior, belonging to Cummings & Co., of Monarch, will start up for continuous work the 1st of April, and have shipping ore to start with. The Gift will likely resume the driving of their entry tunnel, and it is expected that within a few feet pay ore will be reached. The Donning mine is steadily at work opening up ore bodies, and will begin shipping as soon as practical. The Buffalo lode will begin work on the contract, and it is expected that this property will have ore to ship this season. J. C. McQuarrie has resumed work on his property, and is confident of being rewarded early in the future for his perseverance and hard labor with pay ore. Altogether, the winter's work, now so nearly over, has been very satisfactory, with no misfortunes or accidents and lots of good ore opened up.

IDAHO.

SILVER CITY.—*Avalanche*, March 19: We are informed by a gentleman in Silver City that a company has been organized to work the Morning Star mine north of town; that new machinery has been purchased for hoisting works, and that by the time the snow is gone, it will be on its way here. This will be gratifying news to the people of Silver City, who know very well what rich ore the mine has produced in the past, and that as the mine has never been worked to any great extent, there must be more to be taken out. The shaft has been sunk to no great depth, yet there is good ore at the bottom of the shaft and in the north level of the mine. South of the shaft no work has been done, though the south side of the same shows good ore. The first work that this company will do will be done in sinking the shaft, and in opening up the mine for permanent work. The mine carries rich ore.

MONTANA.

BIMETALLIC.—*Phillipsburg Mail*, March 17: The main shaft is down 75 feet below the 200-foot tation. Ground breaking well. Three 8-hour shifts, assisted by Rand drills, are making excellent progress. The header of the 200-foot working level east of the crosscut intersection is in 110 feet with about 3½ feet of pay-rock, of high-milling grade, to the footwall. The level west of crosscut shows from the intersection for a distance of 30 feet about 12 inches of good rock. This, however, has pinched out as the level advances, the face showing the vein 65 feet from the crosscut, to be wide and strong, but with no pay rock to speak of. This is to be expected, however, as the ores of the Granite occur in

chutes, the intervening ground being occupied with usual porphyritic filling. The stopes over the crosscut intersection are up 30 feet, the ore widening as the ground is broken west. From all indications the vein was cut on the western slope of an immense ore chute, which will beyond any doubt continue to the Granite extension ground west end line. The developments show a marked improvement in the quality and width of the pay rock, as the 200-foot level is driven east. No ore is being broken to exceed two running feet per day. During the past week a shipment was made of selected rock. It is not the intention of the management to proceed to active exploitation of the ores of the Blaine mine until such time as the future reduction works of the company are completed and ready for work.

NEW MEXICO.

MILLS AT WORK.—*Cor. Clifton Clarion*, March 19: Leitendorf, the old mining camp near here, is booming up and shows a possible future; two mills, one of 20 stamps and the other ten, being steadily at work with two shifts. The last Chance mine is being again worked successfully, and the ore shipped to the Socorro smelter.

OREGON.

MINERS BUSY.—*Jacksonville Times*, March 19: Miners are still busy making the best of the abundant supply of water. Work has been resumed on the Swinden ledge in Rock Point precinct, and better quartz than ever has been struck. Torrey & Morrison, of Anderson Creek district, turned the water into their ditch this week and are ground-sluicing with excellent results. The warm weather of the past fortnight has had some effect on the water supply, but the spring rains will no doubt make up the deficiency. Wm. Deneff had a lot of new hydraulic pipe made in this place last week, which is already in position and doing good work. A. H. Maegly this week manufactured quite a string of hydraulic pipe for C. O. Bigelow, of Williamsburg district, who is mining on an extensive scale. Klippel & Baume's mill on Shively gulch will commence crushing quartz next week. A considerable quantity of ore has been taken out of the El Dorado ledge, which will probably be crushed first. The Sterling M. Co. has failed to assume possession of Saltmarsh Bros.' placer mines in Stellingville precinct, for which they bargained some time since. The original proprietors are again at work, having commenced operations this week.

UTAH.

PARK NOTES.—*Record*, March 19: Work on the Whitehead group is being prosecuted with vigor. The ledge is looking well, and before long we hope to chronicle the fact that the lucky owners have struck it rich. Discouraging reports come from the Sampson. The leasers have thrown up a portion of their contract, and only ten men are at work in the mine. Unless something takes a turn soon very little ore will be extracted this season. Notwithstanding all this the Sampson is unquestionably a good mine and ought to be made to pay. A. M. Grant, formerly chief engineer of the Ontario mill, is up from Salt Lake on a special mission of short duration. Mr. Grant has charge of making the improvements and repairs to the Crescent concentrator, preparatory to starting up for the season's work, about April 5th. The concentrator will be thoroughly overhauled so that another year's successful run can be made. Thomas Stringer will be foreman of the concentrator. During the week the Crescent shipped 272,750 pounds of first-class ore. The Ontario shipped on the 16th (Wednesday) 42 bars of bullion, containing 24,674 fine ounces of silver. On the 15th (Tuesday) there was shipped to the Marsae mill seven bars of Daly bullion, containing 8124 fine ounces of silver.

WYOMING.

AROUND ATLANTIC.—*Cor. Salt Lake Tribune*, March 19: The Carissa mine still rolls the golden ore out at the rate of six to seven tons per day, and every foot that the stopes are driven shows a marked improvement in the richness of the ore; at the present rate this company will have 400 or 500 tons of ore on the dump by the 1st of May, ready for the mill that they intend to erect for the purpose of milling their quartz. Mr. Philip Harsh is at work developing his group of mines which are showing up well. The Carry Shields still looks as well as ever; the vein varies from 2 feet to 30 inches of high-grade ore. The owners have driven a 65-foot level east on their ledge at the bottom of the incline. This mine shows good \$35 ore from top to bottom in all the drifts and stopes. The Gould and Curry is showing up well; the owners have uncovered four feet of solid ore that will pay them a handsome royalty after paying all expenses of extracting, hauling and milling. The owners of the Poor Man's Lode are pushing developments as fast as possible, and from present appearances this mine will equal the Gould and Curry, of which it is an extension. The Garfield still holds her own with the balance of the mines of the camp. The lessees have about 140 tons of ore on the dump and thousands in sight. The Garfield is another one of the worked-out mines of the country. These worked-out mines are proving to be the best-paying properties of the country. The owners of the Diana have cut through into the old works and expect in many days to astonish the rest of the mining men of the camp. This mine as it is, would be one of the paying mines of the camp if they had the proper machinery. The Mary Ellen is another one of the paying mines of the camp; the owners had to close down for the want of powder as there is none to be bought for love or money.

THE LEWISTON MINES.—The Burr mine discovered last fall is situated about one mile due south of the Bullion mine. The vein is about four feet wide; plenty of the quartz will yield from \$5 to \$7 per pound by pounding it up in a hand mortar. The Anaconda, owned by Mr. John Charles, is a fine property for a large company to take hold of; the vein is from eight to ten feet in width, of very fair quartz. The Ruby lode claim is one of the coming mines of the Lewiston mining district; the owner has opened three distinct ledges on this claim. I would not advise any one to come in here much before the middle of May. There is plenty of room for prospectors, but men hunting work had better stay away until active operations are commenced.

NOTICE TO GOLD MINERS!

This cut represents our

IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

SILVER-PLATED AMALGAMATING PLATES

FOR SAVING GOLD

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used.

WEIGHT GUARANTEED!

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et al.

Prices furnished upon application to

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont St., San Francisco, Cal.

Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, burly-gurlys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 232 Market St., San Francisco.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS No. 252 Market St., San Francisco Elevator, 12 Front St.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Olohe Cases, free of cost,
by applying to the manufacturers.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 262 Market St., S. F.

- FOR WEEK ENDING MARCH 15, 1887.
- 359,418.—LUBRICANT—J. B. C. Barbanson, S. F.
359,438.—BOTTLE SAFE—D. Getelson, S. F.
359,395.—CABLE RAILWAY CROSSING—H. H. Lynch, S. F.
359,358.—CIGAR-TIP PROTECTOR—P. Mish, S. F.
359,403.—AXLE AND WHEEL—J. Pettinger, Carpinteria, Cal.
359,470.—SEED DRILL—F. Reyner, Lathrop, Cal.
359,405.—HOISTING-JACK—D. B. Scott, S. F.
359,365.—GARMENT SUPPORTER—R. H. Sink, Grass Valley, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Mining Share Market.

The stock market is rather inactive. The dealers seem to be waiting for something definite on the Comstock. The Virginia Enterprise says, in this connection: There is an unaccountable wait at the Crown Point and Belcher mines. And, too, the wait comes just at a time when all thought great activity would be seen. The Santiago mill-wheel has been repaired and the mill is waiting, and the Mexican mill, which has been taken from the Savage, is waiting; everything at the Crown Point and Belcher seems to be awaiting the return of Superintendent S. L. Jones.

At the Chollar and Potosi they have been waiting to put up a mill, and now the Savage and Norcross folks must wait for milling facilities. Though they may be obliged to wait for some time at the Savage and Norcross to obtain mills, there will be no waiting in the lower levels of these mines. The work of exploration will be proceeded with. In both mines much ground has been stripped ready for crosscutting on the 1200 and 1300 levels, and all the levels from the last-mentioned up to the 700 level will be thoroughly explored without delay. In the part of the two mines where this prospecting will be done the ground is nearly all virgin. The management are pushing all work as rapidly as possible—in connection with the Chollar and Potosi—with this end in view. The big double drift on the 1300 level is being pushed at the rate of 60 feet a week to connect with the old Chollar incline. This will be another valuable connection for all purposes.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Locomotive, March 19, \$12,000; Con. Virginia and California, 21, \$61,099; Moulton, 16, \$21,200; Bluebird, 17, \$18,992; Alice, 16, \$25,295; Silver Bow, 16, \$90,444; Hanauer, 17, \$51,000; Bannock, 19, \$30,500; Hanauer, 19, \$50,500; Bannock, 20, \$900; Hanauer, 20, \$52,500; Alice, 22, \$13,213; Hanauer, 22, \$12,750. Last week's mineral shipments from Salt Lake were 16 cars bullion, 416,792 pounds; 29 cars silver and lead ore, 862,150 pounds; 10 cars copper ore, 274,300 pounds; 2 cars common lead, 76,525 pounds; total, 57 cars, 1,629,767 pounds.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

- JARED C. HOAG—California.
G. W. INOALLS—Arizona.
E. L. RICHARDS—San Diego Co.
R. G. HUTTON—Los Angeles and San Bernardino Cos.
Geo. McDOWELL—Tulare Co.
T. P. POWERS—Napa and Sonoma Cos.
J. L. DOYLE—Tulahoma and Stanislaus Cos.
M. S. PRIME—Alameda Co.
W. J. FREEMAN—Contra Costa Co.
A. J. HERRMAN—El Dorado Co.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

Liberal Religious Literature.

Views, Opinions, and Sentiments of Eminent Writers on Religion and its Relation to Man and Society. Address MISS HARRIET KELSEY, Sec'y, Unitarian Church, San Francisco. Correspondence invited.

ASSESSMENT NOTICE.

Gover Improvement Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, California. NOTICE is hereby given, that at a meeting of the Board of Directors, held on 25th day of February, 1887, an assessment (No. 2) of ten dollars per acre was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 318 Pine street, room 6, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 26th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. R. N. VAN BRUNT, Secretary. OFFICE—318 Pine St., San Francisco, Cal.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works. Sole Manufacturers, 227 First Street, San Francisco, Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

"CHALLENGE" IMPROVED ORE FEEDER

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Gold Mining Co., Amador City, Cal.

And many others, and we are prepared to furnish either the

"CHALLENGE," "STANFORD," "TULLOCK," or "ROLLER" FEEDERS

And will furnish descriptive Catalogues and copies of Testimonial Letters, and will quote prices upon application.

CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

**Sporting, Cannon, Mining, Blasting and
HERCULES POWDER**

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

HENDERSON'S PATENT TRUSS.

Comfortable and Reliable.

This simple truss can be worn without inconvenience, and gives all the comfort to the wearer that can be obtained from a perfect-fitting, pliable apparatus. The pad is soft and yielding, and on account of its peculiar construction and the connections of its securing hands, cannot get out of place. It will remain in place no matter what position the wearer may assume. The engraving shows the construction of the appliance. It is simplicity itself, and is comfortable and reliable. Address,

JESSE G. HENDERSON,

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1880; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

THE
"TRIUMPH" ORE CONCENTRATOR.

MINING MACHINERY.

San Francisco: Chicago: New York:
127 First Street. 100 N. Clinton. 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING and REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

WATER JACKET SMELTING FURNACES

FOR COPPER and ARGENTIFEROUS LEAD ores of NEW and ORIGINAL DESIGNS, covered by LETTERS PATENT. No other Furnace CAN COMPARE with these for DURABILITY, and in CAPACITY for uninterrupted work. MORE THAN 150 of them are now RUNNING in various parts of THIS COUNTRY, as well as many in FOREIGN COUNTRIES, giving results NEVER BEFORE ATTAINED as regards CONTINUOUS running, ECONOMY of fuel, AMOUNT and QUALITY of BULLION produced. These CLAIMS have been PROVEN BY RESULTS in ANY NUMBER of INSTANCES, and the GREAT SUPERIORITY of this SYSTEM of smelting ores DEMONSTRATED BEYOND QUESTION. COMPLETE PLANTS furnished to order of any CAPACITY, with ALL IMPROVEMENTS that experience has DEMONSTRATED as VALUABLE in this class of work.

Beyond question the cheapest and most effective machine of the kind now in use adapted to all grades and classes of ores.

This machine has been THOROUGHLY TESTED for the past TWO YEARS, under a GREAT VARIETY of CONDITIONS, giving most EXTRAORDINARY results FAR IN ADVANCE of anything EVER BEFORE REALIZED. A recent COMPETITIVE TEST at the Carlisle Mine in Mexico, showed an ADVANTAGE OF OVER 30 PER CENT in favor of THE DUNCAN. The amount SAVED OVER THE FRUE being sufficient to PAY THE ENTIRE COST of the machines EVERY MONTH OF THE YEAR. One of its MOST VALUABLE features is as an AMALGAMATOR. It saves all THE AMALGAM GOLD and SILVER that ESCAPES the BATTERIES, PANS or SETTLERS, making the machine worth MORE than ITS COST for THIS PURPOSE ALONE.

BAKER'S MINING HORSE POWER.

Possessing ALL THE REQUIREMENTS of a FIRST-CLASS HOIST, and affording means for the CONTINUOUS OPERATION of a BLOWER, WITHOUT interfering with the HOISTING APPARATUS. It is made ENTIRELY OF IRON, no piece WEIGHS OVER 300 POUNDS. At the ORDINARY SPEED of a horse, a 700-pound BUCKET OF ORE may be raised 75 feet per minute. The HOISTING-DRUM is under the COMPLETE CONTROL of the man of the shaft and is CAPABLE of CARRYING 500 feet of five eighths steel rope. SEND FOR CIRCULAR.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.
Portable and Durable.

WEIGHT, 4 TONS.
It is a full fledged Quartz Mill without gearing, cogs or pulleys.

Power applied direct. Works Ore at Low Cost
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

Richards' Patent Hydraulic Machinery.

NUMBER I.

We purpose, in the present and some succeeding numbers of the PRESS, to publish engravings and descriptions of a new system of water-raising machinery, invented by Mr. John Richards, who introduced centrifugal pump manufacture in this city five or six years ago.

The first machine we will notice is a hydraulic ram, and in that connection remark that during two years past, this old machine, that, like the blacksmith's anvil, was thought to be perfect, has moved on to a new place among water-raising machines, and has been the subject of some very remarkable experiments in England, where an efficiency of 80 per cent has been gained with a ram of large size.

Mr. Pearsall, a member of the Institution of Civil Engineers, London, writing on the subject of hydraulic rams recently, says: "Almost the only application of the principle has been the common hydraulic ram invented by Montgolfier, 100 years ago, and very little improved on since. Almost all attempts at improvement have been only slight modifications, and have retained features that have unfitted these machines for use on any but a small scale, as more or less violent shocks were an inevitable accompaniment of their action. Indeed these violent shocks have come to be regarded by many people as essential to the working of such machines. Hence the name 'ram.'"

"Careful consideration, however, accompanied by experiments, demonstrates this as an error. Violent shock is not essential to the action of the machines on this principle, though it is an invariable accompaniment of all existing machines. But it can be avoided, and by this avoidance the efficiency is not only not impaired but is increased."

This "revolutionary" proposition respecting hydraulic rams seems plausible enough when we consider that a shock or blow always indicates a loss of power in machinery of almost any kind.

Mr. Richards, in his smaller size rams—those of less than eight-inch—employs two valves instead of one. These valves are nearly balanced, so they close with much less shock than a single valve. They moreover are not shut by the rush of the water around the valves, but by the action of the water after it escapes.

Fig. 1 shows one of these rams arranged for a low head. The water issues at the top and bottom of the chamber at the right; that from the top strikes under the shield seen on the stem and is reversed by a curved surface beneath and thrown downward, so the impact and also the reaction is employed to close the valve. This operation is performed much quicker than with the old style of rams, but as the valves above and below are nearly balanced, there is but little shock compared to what occurs with a single valve—that is, there is but little shock on the valves or other wearing parts, although the pipes receive the full force. The weight and lever are employed in the case of low heads when the water pressure is not sufficient to sustain the valves with the small difference in their area. In other cases this weight is dispensed with.

In the larger sizes Mr. Richards proposes to adopt the isochronal valve movement, by which all shock is avoided. We see no reason why in such case a hydraulic ram of any size cannot be made and work successfully. Those em-

ployed by Sommeiller at the construction of the Mont Cenis tunnel had 30-inch pipes, and some of recent construction are even larger.

Another machine is an improved centrifugal pump, one of which is shown in Fig. 2.

These pumps have a single inlet at one side—a form of construction that has simplicity and

runner, so that the pressure from each side is balanced at the periphery. This adds nothing to the cost or intricacy of the pumps, while it permits a single suction of large diameter accessible and removable, as shown in the drawing.

Another improvement in these pumps con-

Fig. 1.—RICHARDS' PATENT HYDRAULIC RAM.

convenience in its favor, also a saving in first cost, but has been impossible in most cases, because of the side-thrust on the pump-wheels. This thrust has been so serious a matter that many makers have adopted a forked suction, taking

sists in placing the packing gland for the spindles inside the main bearing, next the water, and being on the suction side, no water or other liquid being pumped can come in contact with the bearings. The value of this can be im-

Fig. 2.—RICHARDS' PATENT CENTRIFUGAL PUMP.

the water at each side, and by that means attaining a balanced action.

In Mr. Richards' pumps this balancing of the wheel is accomplished in a very simple manner, by having an equal centrifugal action on each side of the runner, but passing nearly all the water at one side. There is a plate disk with curved vanes on each side, and perforations through the disk at the center, which permits a small part of the water to pass behind the

runner when muddy water or sand is passing through a pump. A patent claim on this method was long contested at Washington and finally allowed by the board of appeal after all possible references had been examined and exhausted. These pumps are made to a scale of systematic proportion, the water-ways being as uniform as possible and all the curves easy. The proportions of all parts are carried out in tables, one drawing answering for all pumps

from 2½-inch to 10 inch, and one other drawing for all sizes from 10 to 30-inch. This method of delineating is a recent invention of Mr. Richards, who has applied it to various machines.

Bogus Quartz.

The joke about the green miner who found a "brass mine" is quite an old one; but it is no joke for a man to buy a gold property and then find it is a "brass mine" in reality. An instance has just come to light in this city which shows rather a new feature in mining ewindles. It is a case where the salters not only prepared the metal, but also prepared the rock in which the metal was placed.

The samples which we saw were "bogus quartz," carrying brass—just plain, simple brass. These "ore" samples came from another State to a San Francisco merchant, to whom they were sent by a friend who wisely wanted reliable information from a California assayer. They were taken to a metallurgist, in this city, for examination. The latter gentleman determined that the alleged gold was nothing but brass. The bogus quartz appears to have been made from a kaolinized rock that is easily crushed, and while in the plastic state was salted with particles of brass like little nuggets of free gold. It was afterward dried and broken in pieces. It falls to mud when wet. These specimens were clearly designed to take in unsuspecting investors.

The supposed ore is white in appearance and shows no signs of gold or other metal on the surface. When broken and pulverized in a mortar, and horned or panned out, the little nuggets of brass remain, and have the appearance of gold. It is rather a new scheme to make both the rock and the gold, and is quite an artistic style of salting.

When soaked in water the specimens fall to pieces and disclose the method of fabrication. The brass chips on close examination show quite plainly the tool-marks by which they were made. The specimens are well calculated to deceive persons not familiar with the subject.

It may be mentioned incidentally in this connection, that what is known as California quartz jewelry, so common in this market and so much admired by visitors here, is by no means all it is represented to be. Good quartz for the purpose became so scarce that the substance is now manufactured. A transparent siliceous material is prepared, which can be made more or less clouded, and then flakes or threads of gold placed thereon in any desired form. It looks almost exactly like real gold quartz and is sold as such. The East will have to look out for its reputation in some things, for bogus gold ore is more difficult to make than wooden hams and nutmegs, or shoe-peg oats.

E. L. BONNER, of Montana, says the best mine in the Territory is the Green Mountain, the stock of which is selling at \$65 a share, or at the rate of \$26,000,000 for the mine. It was discovered four years ago, and is owned by Clark, McClure and others in St. Louis. Other fine properties in its vicinity are the Bi-metallic, Black and West Granite. They are all paying handsomely.

THE Drumlunnon mine, Montana, is yielding about \$125,000 per month.

Fossil Remains.

Some Found in San Luis Obispo County.

The immediate vicinity of Templeton is rich in fossil treasures, and the laborious researches of some of our citizens into the habitat of prehistoric saurians and mammals deserve recognition and honorary membership at the bands of the Academy of Sciences. On several occasions the *Times* has recorded the unearthing of fossil bones of antediluvian monsters, but the largest exhibit in this line was accomplished a few days ago by A. Crum and J. W. Cook, who brought in a large wagon-load of monstrous petrified ribs, vertebrae, shoulder-blades and other portions of the anatomy of mammoth creatures who inhabited this country when the slowly receding ocean left it one vast watery marsh. This large collection is now exposed to public view on the south piazza of the Templeton hotel. There is no region in the State richer in fossil remains than this section, which is now from 700 to 1000 feet above the sea level, and gentlemen who combine the possession of leisure with a taste for geological research would find the country hereabouts interesting for exploration.

One of the peculiarities of the county, from a geological point, is the distribution of fossils in belts. Immediately around Templeton it appears to have been the home of mammoth saurians and mammals. Ten miles distant, on the Santa Margarita ranch, owned by General P. W. Murphy, there is an extensive and remarkable deposit of petrified oysters, on a ridge which is at least 1000 feet above the present sea level. The deposit is probably a mile in length by half a mile in width and of unknown depth. One of the specimens now in this office is nearly a foot in length by six inches in width—a perfect oyster thousands of years old. There are many larger specimens to be obtained, this one having been taken out of a wagon rut in the county road where it crosses the oyster ridges.

In another locality, about ten miles distant, on Santa Rosa creek, near Cambria, H. S. Messenheimer, while digging a well, found a perfect flint arrow-head at a depth of 17 feet, and for 35 feet the excavation penetrated a deposit of fine, small shells, an immense mound of which still exists near where the well was dug. Northwest of Templeton, near the residences of Mr. Messenheimer and Mr. Carr, both old residents in this part of the county, there is a large rock, the exposed portion of which will weigh 700 or 800 pounds, and imbedded in it is plainly discernible the upper part of an immense fossil skull, in one portion of which is a tusk about seven inches in length.

This hasty allusion does scant justice to the interesting fossil region by which we are surrounded, and is written mainly in the hope of attracting the attention and investigation of some one possessed of more scientific knowledge and more leisure than we possess for this exploration of the geology of a region which is rich in promise and indications.—*Templeton Times*.

At Quijotoa, Arizona.

Mining matters at the Quijotoas are looking up, and while there is no semblance of a boom, a great deal of activity exists, and the fact is being better demonstrated daily that this is one of the coming great mining camps of this Territory. The slow and steady work of months and years is just revealing the rich secrets of these noble hills, and Dame Fortune, that has so long coquetted with the toiling miner, is at last looking with sincere favor upon her persistent wooer, and is ready to break the bolts and hars of nature's locksmith, and go forth to reward his devotion with her perpetual smile.

On the west side the greatest activity is noticeable and the most developments are being made there. In the Weldon, the heart of the tunnel is all in ore, a late and rich find, which assays from \$50 to \$500, the average being over \$100. The ledge on the surface pitches toward the tunnel, and it is known that all between them is good ore. At the mouth of the tunnel there is another very promising claim that shows excellent ore. Work on the Weldon is conducted both day and night, and is progressing with satisfactory rapidity.

At the Central, water in their new well was struck at a depth of 55 feet, and everything is now progressing favorably.

The Locomotive is showing more and better ore than ever before. Hank Murray has displayed great ability as superintendent, and it is to his judgment and skill that it has been made a brilliant success. More ground is being opened, and there is plenty of ore to warrant the employment of the full capacity of the mill, which will very shortly be running its 20 stamps. The Bonanza tunnel is being worked by a day force only, and about 60 men are employed on this and the Locomotive.

A town called the Locomotive has been started on the west side. There are, among other necessities of a first-class town, two saloons with the usual quota of games of chance. Brown and Moloney run these institutions, and the boys all play poker but bar professionals. A boarding-house and chop-house have been started, and a few days ago a watchmaker and general handy man from San Pedro established himself in the new camp. Half a mile south is another boarding-house for the Bonanza tunnel men, and a saloon was also started there last

Saturday. The dry washers at the Horse Shoe, five miles north, are doing well. About 35 men are at work, and they are taking out from \$5 to \$10 per day per man. This is regarded as a pretty good opening for placer miners who do not look for a sudden bonanza.

NEW PLACER DIGGINGS.—Washed gold was found in the gravelly beds of the canyons in the east range of the Humboldt mountains by prospectors in early days, but as the idea then prevailed that no gold mines of any consequence, either in quartz, lead or placer, existed in Nevada, no systematic method of working the gravel was attempted. Of late years several leads in the east range, notably the Ross and Golden Chariot companies' mines at Dun Glen, have been worked exclusively for gold, and the fact has been established that not only paying gold-bearing ledges, but placer mines, exist in many parts of the Humboldt and east ranges. Recently two prospectors, Tom Hannigan and E. Smith, found rich auriferous gravel in a canyon in the east range, almost directly across the valley from Unionville, and a few miles south of Kyle's Hot Springs. The discoverers located several placer mines and have disposed of some of them to Chinese. Pat Hansy, who returned from that section a few days ago, says that Chinamen are swarming into the new diggings, and there are now 100 or more of them in the canyon. They are building a storehouse there, and a large number of them are at work sluicing and rocking the gravel. He could not ascertain what the diggings are paying, but the fact that Chinese merchants are building there indicates that the mines are good. There is considerable water in the canyon in the spring and early summer months, and the diggings are said to be quite extensive.—*Winnemucca Silver State*.

A BURIED TOWN.—A few days ago two prospectors, while wandering over the foothills east of the city, accidentally stumbled on signs of previous habitation buried under heaps of sand which had been drifted by the winds of years. Having selected a point at which to make an excavation, they went to work with a will, and in a few hours had reached the floor of a small chamber in the form of a parallelogram. They found the remains of several human beings, several handsome vases carved with geometrical figures in different colors, stone axes, bammers, pieces of cloth apparently manufactured from the fiber of the yucca; several strings of beads, sea shells, arrow-heads and an abundance of fragments of obsidian quartz, and an incredible quantity of pieces of broken pottery, including several with a blue glazing. Only in one other instance have we ever heard of this color and quality of ware having been discovered in this Territory, and that was at the ancient pueblo near the Santa Rita in this country, and it indicates that the Spaniards had lived in New Mexico before the extinction of the race who inhabited this ruined and buried village. Our friends will continue their excavations, and the cabinet which will result from their labors will be offered for sale to those who cherish these objects of the past.—*Socorro (N. M.) Bulletin*.

FISH COMMISSIONERS.—A Sacramento dispatch of March 24th says: The new State Board of Fish Commissioners, composed of J. Downey Harney, of Los Angeles, J. Routier, of Sacramento, and T. J. Sherwood, has met and organized by the election of Routier as president and Sherwood secretary and treasurer. R. H. Buckingham and A. B. Dibble, the old commissioners, turned over the books and presented an inventory of the State property. J. R. Lewis, of San Francisco, son of Assemblyman Lewis, was elected license collector of the commission, pursuant to a law passed by the last Legislature, levying a tax of \$5 or more on each fishing boat. J. S. Benn, of San Francisco, was appointed a deputy fish commissioner for San Francisco and vicinity. G. Willage, also of San Francisco, was appointed a deputy commissioner and chief of patrol of the bay and rivers. He will have charge of the commissioners' launch, Governor Stoneman, and he has been instructed to be relentless in the pursuit of fish-law violators. The regular monthly meetings of the board were fixed on the 15th of each month. The next meeting will be held in Sacramento. After that they will be held in San Francisco. The employees of the commission were ordered to make monthly reports.

MOUNT CORY.—The Mount Cory mine, under the immediate supervision of R. M. Ballard, who doubtless is one of the best miners on the coast, is constantly improving. Under his management, hoisting machinery has been erected, pay ore has been discovered where no one else expected to find it, and that too in a large quantity, several tons of which are now on the dump and a plentiful supply awaiting to be stowed out. The level on the northeast drift is materially improving, and now Mr. Ballard believes that another strike of pay ore will be found on the west side of the present large ore body. The mill will soon be started up, and it is reported that Geo. W. Penter is making preparations for hauling the ore with his teams. The mine has yielded a considerable amount of money, but now that its operations are managed by such a thorough mining man, who after taking hold thereof, and in so short a time, has made such valuable developments, a handsome profit will be realized therefrom by its owners and create a boom in this section.—*Esmeralda News*.

Wood River Galena Ores.

Mining men who visit Wood River for the first time are invariably surprised at the narrowness of our ore veins, and cannot at first be made to understand how they can be more profitable to exploit than veins four times as wide. After they examine a few, however, and always with the same astonishing results as to value, they drop their prejudices and come to the conclusion that such high-grade ore as we have would prove remunerative, however narrow the veins.

The fact is, our ores "make into money" more rapidly than any others on the face of the earth, and that Wood River's high-grade ores are unrivaled. To exemplify: Take a block of ore, such as would be exposed in any mine by a short drift, but under the conditions existing on Wood River. Say that the drift exposes a length of 10 feet of galena ore, by a height of six feet and a thickness of one foot. In gold or silver mines there would only be from four to five tons of ore thus exposed. On Wood River, however, such a block of ore would yield 17 tons; and this quantity of ore, averaged at 120 ounces silver and 70 per cent lead (which is certainly below the average yield of our ores), would bring \$150 per ton, or \$2550 altogether. Only think—a block of ore, 10 feet long, six feet high and one foot thick, would bring \$2550! And this is not a rare occurrence. It is the case in most of our producing mines. On this basis a block of ore, 100 feet high and only one foot thick, would yield about 2860 tons, worth \$420,000.

As no such results were ever obtained anywhere else, it is easy to understand how visiting experts cannot grasp the condition of affairs here, nor understand why we think as much of our mines as we do. But if any of these experts remain here, from any cause, and familiarize themselves with our formations, they soon become as enthusiastic as any of us, and finally, though reluctantly, admit that our ores make money faster than any ores they ever saw.—*Wood River Times*.

Comstock Bullion Product.

Official Statement of the Output During the Quarter Ended Dec. 31, 1886.

Following is a summary of the ore and bullion output from mines in Storey county, Nev., during the quarter ended Dec. 31, 1886, condensed from the assessor's abstract statement filed at the office of the county recorder:

Consolidated California and Virginia—31,653 tons of ore of the average value of \$25.45 per ton, produced \$805,535.36 in bullion; total cost of production, \$435,969.32, leaving a balance of \$369,566.04 subject to taxation.

Savage—Total output, 160 tons; average assay value, \$11.40 per ton; gross bullion yield, \$1824.05; total cost of production, \$1618.84.

Belcher—Ore output, 10,740 tons; assay value, \$8.83; gross yield, \$89,420.48; cost of production, \$84,272.49.

Crown Point—Ore output, 10,386 tons; assay value, \$9.81; gross yield, \$101,433.78; cost of production, \$96,339.59.

Kentuck—Ore output, 3238 tons; assay value, \$12.70; gross bullion yield, \$41,144.78; cost of production, \$44,360.60.

Yellow Jacket—Ore output, 16,505 tons; assay value, \$10.04; gross bullion yield, \$165,724; cost of production, \$220,807.25.

Recapitulation.—Total ore output, 72,682 tons; bullion yield, \$1,205,083.27; cost of production, \$883,368.09. The total net bullion proceeds taxable foot up \$321,715.18, the tax upon which is \$16,630.47. This sum was paid into the Storey county treasury, Wednesday, by the various companies.

AT TOMBESTONE.—In visiting the different mines in this district, it is surprising to see the amount of work which is being done by men who own the properties—in other words, there is more prospecting being done in Tombstone to-day than ever before in the history of this camp. Mining, like all other industries, has its ups and downs. It has to contend with a ring in Wall street, but in spite of all this oppression, it is gradually forging its way to the front. There always has been some feeling not of a kindly nature between the cattlemen and the miners, but it was nothing but a prejudice and is fast disappearing. There is nothing to create or maintain feelings between these parties other than of amity. The mining man pays his full proportion of taxes, in fact the mines contribute more toward the support and maintenance of our county government and its people than any other source. Taxation rests about equal on all, and all should bear it with becoming decency and propriety.—*Tombstone Epitaph*.

MUCH as we have cause to pride ourselves on the great advancement of the anthracite coal trade, it must be conceded that in proportion the bituminous trade far outstrips it. Of a total production of coal for 1886 of over 107,000,000 tons, the anthracite output was 32,000,000 and the bituminous 75,000,000. Another particular in which bituminous coal surpasses its harder competitor is that whatever measure of trade it has gained it has held, while anthracite has had its ebbs and flows, in one year showing a decrease of fully a million tons.—*Exchange*.

Immigration and the Labor Problem.

Reliable statistics inform us that from 1820 to 1885 over 13,000,000 of foreign-born persons reached the United States as immigrants. The lowest figure of any one year was 6354, in 1853; the highest was 788,992, in 1882.

Comparing the yearly arrivals, it is found that the greater number of arrivals invariably preceded the years of our greatest depression in business. This inference, very naturally, is that these excessive foreign accessions to our population have formed an important factor in our periods of business depression.

It is apparent to the most casual observer that the great bulk of the immigration concentrates in cities and towns which are recognized as leading industrial centers, and more especially in centers of mechanical industries. Comparatively few immigrants enter upon agricultural pursuits. The unskilled immigrants resort mainly to commercial cities, where there is a large demand for unskilled labor; the skilled immigrants gravitate to the mechanical shops wherever they may be found. The following figures, giving the number of foreign-born persons, 10 years of age and over, who were engaged in agriculture, manufactures, etc., as per census of 1870 and 1880, furnish abundant proof of the above:

	1870.	1880.
Population 10 years of age and over.....	28,228,945	30,761,607
Foreign born 10 years of age and over.....	5,307,887	6,491,301
Foreign born engaged in agriculture.....	619,108	812,829
Foreign born engaged in manufactures and mining.....	929,581	1,225,787
Total foreign born engaged in agriculture, manufactures, etc., 1,548,689		2,038,616

A careful examination of these figures shows that our foreign-born population constituted but a fraction over 10 per cent of those engaged in agriculture, while the foreign element engaged in manufacturing, mechanical and mining industries represents 32 per cent of all persons so employed.

These are important facts for the consideration of our political economists. The trouble does not arise so much from the fact of a large immigration as from the manner in which that immigration is distributed; although another class of figures might be given, and, in fact, were given, in these columns some months ago, which tend to show that unpleasant complications may arise in the near future which, very likely, may call for some restrictive legislation in regard to immigration. Still, such legislation would be attended with difficulty, and would set at naught one of the cardinal principles upon which this Government was originally organized. It is doubtful if the people of this country will ever submit to fence in their territory with a Chinese wall, except it be to fence out people like the Chinese, themselves who can never assimilate with our people or their institutions—civil, religious or social. A large portion of the very best blood in this country entered into American life by a voyage across the Atlantic. Notwithstanding the many difficulties in the way of keeping this country perpetually open, as a harbor of refuge and protection to the oppressed and suffering of all nations, we must devise some means to receive and distribute those who come to us in a way by which both the corner and the resident shall be mutually benefited. We cannot conclude this brief article better than by quoting the words of a cotemporary, as follows:

Addition to population rightly distributed and in proportion to its possibilities is the soul and sinew of our development. It has made us what we are in the sovereignty of a continent and in the nations of the world. To disperse the immigrant is to desecrate our fathers' graves and to insult the verdict of our history. The whole evil consequent to foreign immigration lies in its one-sided direction and its overgrown proportions, and the task of statesmanship is in the way of curtailing its magnitudes without profaning its rights. To encourage what is desirable of population in its kind and quantity is, and will be for years to come, a national duty and a reserve source of strength and progress, while a blind and indiscriminate permit of immigration will just as surely end in catastrophe and industrial calamity.

NO DEBRIS.—While the bed of Feather river was laid here last summer it was found that no debris from the hydraulic mines of Plumas county had come down the river to that point. The river had shown only the original gravel that had been found in it by the miners who built windmills at Island Bar, Berry Creek and Whiskey Bar as far back as 1855. This is conclusive proof that the mines about Spanish Ranch, Shores Hill and Curtis' Point, above American valley, as well as those near the mouth of Spanish creek and along the East Branch, have never sent down an ounce of tailings or debris within at least 25 miles of this locality, and hence have never done the slightest damage to farming lands in the Sacramento valley.—*Oroville Register*.

FOREIGN IRON.—According to the *Iron Trade Review*, the recent American purchases of foreign iron, when simmered down to facts, amount to this: The St. Louis parties bought 10,000 tons instead of 25,000 tons, and the Chattanooga parties, in place of buying 40,000 tons, took exactly 3000 tons. Aggregate according to sensational dispatches, 65,000 tons; aggregate in fact, 13,000 tons. The story was only magnified five diameters.

The Present Mining Law.

Previous to the law of 1866 the United States had no mining laws which were applicable to the mountain regions of the West. Those who had located mining claims in the mountains had been trespassers on the public domain. The law of 1866 gave a man the right to the lode with its "dip, spurs and angles." It is evident, from a perusal of the discussions while that act was under consideration, that fissure veins were the only class of ore-bearing mines thought of. The real thing sought to be given the claimant was the lode or vein, while the surface was not of any account except as it might be necessary for convenience of working the lode.

Experience demonstrated that there were imperfections in the law, and that the provision in relation to spurs and angles would give rise to endless litigation. It was this that gave rise to the act which became the present law in 1872. It was this which caused the right to surface boundaries and all lodes within them to be clearly defined. The bill, as originally introduced, was framed by a commission appointed for the purpose, and that bill, as introduced in Congress, confined all claim-owners to their vertical side-lines, thus shutting off one's right to follow a lode on its dip beyond the side-lines. In the Senate it was amended to its present form, and made to include deposits of cinnabar. Throughout the West at that time the only kinds of ore mines which the miners knew were fissure veins; they thought of its application only to veins, as they then understood them and as geologists understood them. It was different with the scientific gentlemen who framed the bill. The miners believed in a law giving a man the right to follow a fissure vein on its dip, because they believed in making the lode or vein the thing claimed and owned.

With the lapse of years, ore deposits were found in limestones, and in contacts, which lie nearly horizontal, and are fissure veins, such as the miners believed the law applied to. The result of that belief can be seen in the way they located claims in the days of their early discovery in regions like Leadville. Many were located side by side, without any regard to the outcrop or apex. It was the natural sentiment of justice and fair play manifesting itself. It was also the best possible proof that Judge Field was in error when he ruled that miners called any form of ore body they might have their vein, and meant the word vein to apply to all forms of ore deposits. In letter that was true, but in spirit it is untrue, as the acts of the miners in locating claims in limestone showed. If they had thought and believed that the law should apply to such deposits, there never would have been any question regarding the right of the one who held the apex or outcrop to follow the ore beyond the side lines of his claim. The proof of that fact can be found in every mining camp containing the contact or limestone deposits. In the few whose claims were not located side by side, parallel with the outcrop, they were located side by side across, or at right angles with the outcrop. And in these locations there has been a very general acquiescence by the miners.

If there ever was a decision which, in the opinion of most miners, was contrary to the spirit of truth, justice and equity, it was the famous decision in the Richmond case. It is a decision, too, which was in direct opposition to the welfare and best interests of the mining industry.—*Denver Republican.*

GREATEST TUNNEL DRIVING ON RECORD.—Reports come from the engineers in charge of the construction of the Colorado Midland railroad, which show remarkable progress in tunnel driving. The Colorado Midland railroad starts at Colorado Springs and runs through Ute Pass and Eleven-Mile Canyon to Leadville. In the Ute Pass are nine tunnels, the longest about 600 feet. Tunnel No. 5 has recently been completed—length 515 feet. On the week ending November 17th, a run of 98½ feet was made with two Ingersoll "Eclipse" drills, size "D," three inches diameter of cylinder. Following are the particulars: Material, hard red granite. Heading, 8x16 feet section, commenced October 17th; completed November 17th. Contractors in charge of tunnel, McMurtrie & Streeter. Superintendent of tunnel, F. W. Dashe. This goes on record as the greatest tunnel drive that has ever been accomplished, and considering that only two drills of small size were used, it is an extraordinary record. The following certificate verifies the accuracy of the report:

ENGINEERING DEPT., COLO. MIDLAND RAILWAY CO.
Office of Tunnel Engineer,
MANITOU SPRINGS, COLO., March 22, 1886.
F. W. Dashe, Supt. of Tunnels 5 and 6, Manitou, Colo.:
DEAR SIR: Herewith I certify that your work's drive at the East heading of Tunnel No. 5 for the week ending November 17th, according to accurate measurements of the 10th and 17th of November, was 98½ (ninety-eight and one-half) feet. Section of heading being 8 feet by 16 feet. Character of rock, red granite.
(Signed) WILLIAM BREKERS,
Engineer in charge of tunnel.

Plumbers Now Licensed in San Francisco.

The Legislature just adjourned passed the following amendments to the Act regulating plumbing and drainage:

It shall not be lawful for any person to carry on business or labor as a master or journeyman plumber in any incorporated city, or in any city and county in this State, until he shall have obtained from the Board of Health of said city and county a license authorizing him to carry on business or labor as such mechanic. A license so to do shall be issued only after a satisfactory examination by the Board of each applicant upon his qualifications to conduct such business or to so labor. All applications for license and all licenses issued shall state the name in full, age, nativity and place of residence of the applicant or person so licensed. It shall be the duty of the Secretary of each Board of Health to keep a record of all such licenses issued, together with an alphabetical index to the same.

A list of all licensed plumbers shall be published in the yearly report of the Health Officer of the Board of Health.

At the last meeting of the Board of Health, Drs. Perry and Alers were appointed to act as

Santa Barbara Mission.

We give on this page a sketch of the Old Mission church at Santa Barbara. Now that Santa Barbara is feeling the effect of the new life in California affairs, as the long-desired railway is approaching the town, and varied city improvements are afoot, it is worth while for a moment to turn the mind upon the vestige of the old life of the place. The Santa Barbara mission recently passed its centennial birthday, as it was established in 1786. In the small engraving at the lower corner is given a glimpse of the general form of the building. The main structure is 200 feet in length and nearly 50 feet in width, and the wing is 130 feet long. It is upon the corridor of this wing that the main sketch is made, and the figure is a Franciscan monk. Santa Barbara mission is the only one, it is said, where the Franciscan monks still remain. The grounds of the Mission are spacious, and a ride to the spot is the proper thing for tourists.

ANNUAL STATISTICIAN.—The *Statistician* for 1887, published by L. P. McCarty, is now out. This is the eleventh edition of the *Statistician* since its beginning. It contains important changes in all its departments, innovations in its arrangement, and an increase—though not in size—in valuable matter. Over 30 additional countries have been introduced, and also a

THE OLD MISSION CHURCH AT SANTA BARBARA.

a committee to confer with the Health Officer and representatives of the Master and Journeymen Plumbers' Associations, to adopt measures for carrying out the provisions of the amended law. The committee met on Friday last at the rooms of the Master Plumbers' Association. The Master Plumbers were represented by W. F. Wilson, W. L. Daniel, James Sheppard, R. A. Vance, C. J. Riley, D. Bush, and the Journeymen by J. E. Sweeney, inspector for the Board of Health of plumbing and drainage. An informal discussion was engaged in regarding the best means of conducting the examination of applicants for licenses. It was finally agreed that the most satisfactory examination would be to ask the applicants a certain number of questions and then to have a rigid blackboard exercise, to be conducted by a practical plumber. In addition to the proper officers of the Board of Health, there will be present, at these examinations, representatives of the Master and Journeymen Plumbers' Associations. Drs. Perry and Alers said that they were content to leave the preparation of a series of questions to be asked the applicants to committees to be appointed by the two associations. This met the approval of the plumbers, and an adjournment was taken. At the next meeting final arrangements will be perfected.

A BIG TUNNEL FOR A PACK-HORSE.—Last week a pack-horse belonging to the Nevada City and Downieville Stage Company fell over the grade above Camptonville and slid down the snowy embankment 3000 feet to the North Yuba river. The drivers could not then get down to where it was, even to recover the express matter with which it was loaded, and went away giving it up for a total loss. A few days later, when James Miller was coming down with a band of cattle, he saw the poor animal's predicament and rescued it alive with its load. —*Transcript.*

Notices of Recent Patents.

Among the patents recently obtained through Dowsy & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CIGAR-TIP PROTECTOR.—Phenes Mish, S. F. No. 359,358. Dated March 15, 1887. This is an exterior envelope or tip made of a thin tissue of rubber fitted permanently to the end of the cigar, so as to leave the point exposed, and having openings or perforations made through the envelope, by virtue of which the sides of the cigar are moistened when it is placed in the mouth.

LUBRICANT.—John B. C. Barhanson, S. F. No. 359,418. Dated March 15, 1887. This is a chemical combination of certain ingredients, which makes a lubricant in the form of a liquid thin enough to be used in ordinary squirt cans, yet it holds plumbago in suspension and makes no deposit. The inventor states that in its use it does not run from the bearings, and has a tendency to cool them. It is economical in its preparation, and remains liquid at all times.

HOISTING-JACK.—David B. Scott, S. F., assignor of one-half to Joseph Gillenwaters, of same place. No. 359,405. Dated March 15, 1887. This invention relates to that class of hoisting or lifting-jacks on which a ratchet-faced lifting-bar, mounted and guided in a suitable stock, is operated by means of a lever and pawls engaging the ratchet-face of said bar; and the invention consists in the novel arrangement and construction of parts by which the bar is both raised and lowered, and by which the pawls are thrown into and out of engagement. This is a jack which is simple in construction but has great power, and is easy of operation.

WHEEL ATTACHMENT FOR BICYCLES.—James Brusis, Oakland. No. 359,126. Dated March 8, 1887. This attachment to bicycles consists in adjustable auxiliary wheels, located upon each side of the large wheel of the machine, and adapted by means of a lever on which they are mounted to be thrown down in contact with the ground, in order to support the machine in an upright position when at a standstill, and to be moved up again out of the way when the machine is traveling. The object of the attachment is to provide practical means for supporting the machine in an upright position when at a standstill in order to facilitate mounting and dismounting, and to provide for a rest when desired.

BOTTLE SAFE.—David Gtleson, S. F. No. 359,438. Dated March 15, 1887. This is a means for incasing and protecting bottles for transportation, and a means for allowing the bottle to be removed from its safe and protecting envelope for the purpose of washing, examining, cleaning or filling. Glass demijohns or bottles are, in order to be protected from breakage, often incased in woven wicker-work, and in some cases demijohns are incased in exterior wooden cases, the upper parts of which are open to obtain access to the mouth of the demijohn only; but in both these cases it is difficult or impossible to get at the interior to see if it is clean or discover flaws or streaks in the glass. This new invention is an exterior case having a hinged door, lock and handles, with a sliding removable bottom, chambered to receive the bottom of the demijohn, and a perforated top piece to receive the neck and guide it so that the whole may be slipped into or out of the safe when the door is opened. The inside of the safe has suitable elastic packing, part of it removable, and all fitted to the demijohn.

CROSSING FOR CABLE RAILWAYS.—Henry H. Lynch, S. F. No. 359,396. Dated March 15, 1887. This invention relates to an improved means for impelling the cars of one line of cable railway across another line which is running at an angle with the first, and in which case it is necessary for the car which crosses to temporarily let go its cable altogether. When two lines of cable railway cross each other it is necessary that one line of cable pass below the other crossing line, and when the car upon that line reaches the crossing the grip must be disengaged from the cable temporarily, the cable being depressed below that of the transverse line, and the car must be carried over the intervening space occupied by the transverse tracks either by a slight incline or by the momentum gathered before the grip is released from the cable. This cannot always be properly effected, as it sometimes happens that a team will cross in front of the car just at the time when it should have momentum sufficient to cross the transverse lines, and the car would have to be stopped at such a point that it would be necessary to push it across when it is again started. Mr. Lynch's invention consists of a friction wheel or roller driven by the movement of the main cable, and a means for bringing this wheel into contact with the foot-board or some other portion of the car, so that it will move the car across the required space by directly applied power.

A CONTRACT has been signed between the West Coast Land Company and the Pacific Bridge Company of San Francisco to build a bridge across the Salinas river, at Templeton, with three spans, each 110 feet, and iron piers, filled with concrete, to be completed May 21st.

Passing Events.

The winter is now practically over, and already we hear of the prospectors being out in many localities. There is every probability of quite a "boom" in California quartz mines this year. Those who are lucky enough to find quartz ledges of any sort of value will have no difficulty in selling their property or getting their ores worked.

It is stated that a number of miners are going into the Yukon river country, in Alaska, this season. Some pretty big stories are told of the finds there last fall. No one, however, who is not well supplied with money, should venture so far away. The mining season is short, expenses are heavy, transportation difficult, and the country entirely unsettled.

The whole State is at present showing activity in railroad building and the building and improving of cities and towns. Large tracts of lands are being divided up and sold in smaller pieces to new settlers. This will be a very active year in California.

The Interstate Commerce bill goes into effect in a few days, and the people of this State and city are particularly anxious to learn exactly how it is going to work.

DR. ALBERT KELLOGG, the last surviving charter member of the California Academy of Sciences, and one of our best-known local botanists, is dangerously ill at his residence in Alameda.

Does Mining Pay?

The question here propounded is one that many papers in the East delight to ask and answer in the negative, some of them going so far as to aver that every dollar taken out in mining for the precious metals costs two dollars. That the business should, under these circumstances, have gotten on so well, is like many other seeming impossibilities, susceptible of explanation. The boy, going over a slippery road to school, finding that for every step forward he slipped back two, got there at last by turning round and going the other way. And so, we suppose, this business of mining has reached its present advanced position by going backward! The value of the precious metals mined in this country to date approximates two billion dollars. Whence came the other two billions that enabled our miners to make this production? From the country, we guess, where Cain got his wife! If it takes two dollars to get out one, how was the first dollar ever gotten out? As the origin of matter must remain one of the mysteries of creation, so must this remain one of the mysteries of mining!

The truth is, that mining for gold and silver, while it pays as a general thing, does not always do so, being in this respect like a great many other important industries—raising wheat and hogs, for instance. As a rule, these are found to be profitable, though they have their bad years, the trouble being sometimes local and sometimes general—now it is the markets, again the weather or the insect pests, or the swine take the cholera and die, if, to be sure, the thrifty hog farmer do not with the butcher-knife anticipate that event. Sometimes lack of success is due to bad management, sometimes to unfavorable conditions. Bad farming on good land and good farming on bad land alike result in failure. It is just so in mining, though success here is not dependent on such a great variety of causes as in most other industries. In mining, good management and good judgment are the things that win. With these, few losses or failures have occurred in the practical department of the business.

But the trouble with those who criticize this industry is their inability or indisposition to discriminate between the productive and the speculative branches of the business. In the latter, it must be admitted, there has been much money lost, just as there has been in grain, pork and oil deals. Just now there is a big wheat gamble on the tapis in Chicago, by which, however it results, somebody will lose heavily. But no one will think of charging these losses to the growers of that cereal. Millions are sunk every year by operators in petroleum, yet the odium of these losses is not cast upon the owners of the Pennsylvania oil wells. But when it comes to mining there seems to be everywhere a disposition to make it answerable for all the infamies practiced in its name.

To question the profitability of gold mining in California is preposterous. There has never been in all the past an industry that has paid like this. During the first 10 years of its history it added to the circulating medium of the world five hundred millions, enriching not only the miners, but the bankrupt and impoverished nations of all Christendom as well. And yet it received during that time comparatively little capital from abroad, the few money ventures made here having, as a general thing, proved fortunate to the investors.

With the inauguration of vein mining, owing to our inexperience and the inherent difficulties of the business, the losses attendant on its prosecution were for a time somewhat increased. But these difficulties have been so far conquered that gold mining in California ranks now among our most safe and profitable pursuits, if, indeed, it may not in this respect be said to take the lead of all others. Not only so, but the business is from this time on bound to improve rapidly; year by year it is destined to advance, gains being made in all its departments. As it has paid in the past, so will it continue to pay hereafter, nor is it easy to estimate its importance as a factor of productive wealth, or foresee the large place it is to occupy in the industrial system of the future.

The steamer Yukon made several trips from Juneau with miners to the Yukon country, Alaska, and a large amount of gold-dust is expected to be taken out there during the coming season.

Local Improvements.

The very marked increase in population in the Southern portion of this State of late, and the consequent increase in land values, had the natural effect of causing very marked improvement in the cities and towns. New hotels, new street railroads, hundreds of new residences and business houses, etc., have been built. Gradually the spirit of enterprise has spread until now there are few prominent towns in California that are not formulating plans for improvement. Of course in a city as large as San Francisco improvements are constantly going on unnoticed, which in smaller places would be loudly heralded. This city is rapidly growing and tracts which a few years since were bare are now being built up.

But in public improvements we have been laggards of late. In Golden Gate park alone some little advance has been made, but not at all commensurate with the importance of the place. The streets are mainly in bad order, and our general sewerage system is acknowledged by all to be behind the times.

By many all this is laid to the "dollar limit," under which we have been working for some years. But the real reason back of that is to be found in the fact that the people have not had confidence in the officials who have the spending of the tax money. Political bosses have had too much influence in appointments to forget confidence. As a result the dollar limit of taxation came into vogue, and public improvements of any magnitude could not be carried on.

A general disposition is now manifested, however, to do something toward beautifying the city, and putting it more on a par with other places of its size. Influential taxpayers have addressed the mayor on the subject, calling his attention to the necessity of a more liberal and extensive scale of public improvements. Information is desired from the mayor as to what should be done, the nature and extent of the improvements, their probable cost, the methods by which they are to be paid for, and the power of the municipality to enter into them. Among those things which are referred to are the probable cost of completing the City hall; the question of improvement of Golden Gate and Van Ness avenues; the practicability of making new and wide avenues as approaches to the park; the best method of repaving the streets; the condition of the sewers, and best means of remedying their defects; the improvements in Golden Gate park; the best means of repairing schoolhouses and providing additional accommodations; the question of ingrefting the kindergarten plan on the public school system, and that of providing public recreation grounds for children. The petition to which we refer concludes as follows: "We are of the opinion that the city should now enter upon a liberal and comprehensive policy with reference to these public improvements, and it is important that we should ascertain our situation in order to know what is necessary to be done, and in order to acquire the power necessary to do it."

The proposed plans, to which we have before referred, of making cable roads of some of the horse street-car lines, extending other cable roads, and building new ones, will be factors in the line of improvements. Then if any of the others are carried out in repaving streets, building schoolhouses, laying out recreation grounds, improving the park, rebuilding the sewers, finishing the City hall, etc., there will be plenty of work for all our laborers, mechanics, and workmen of all kinds.

It is pleasant to note these evidences of enterprise and progress. San Francisco, as the metropolis of the Pacific Coast, cannot afford longer to let her opportunities pass. She should keep the lead she has held so long, and let no spirit of parsimony cause her to stop in the advance. The wealthier taxpayers express their willingness to see more improvement, and the poorer ones will all be benefited. Our foundries, machine-shops and factories will all come in for a share, while the laboring classes will have plenty to do. The present mayor of the city seems to have the confidence of the community, which is fortunate at a time when the people themselves show a decided desire to advance public improvements.

An explosion by which 70 miners were killed occurred Wednesday in the Bulli colliery, Sydney, New South Wales,

The Late Incomers from the East Wax Sharp and Skeptical.

As many of the people now reaching California from the East come with a purpose different from that which actuated former arrivals from that quarter, it is to be expected that they will examine into matters and things here in a more careful and scrutinizing manner. A large portion of the present immigration come to buy land on speculation, or to settle and make their homes here; wherefore it behooves them to proceed with caution and avoid mistakes at the start. And this, it may be observed, they seem disposed to do, the most of them acting in a prudent and business-like manner. Instead of accepting statements in an off-hand way, as was once the case, they listen to what others have to say and then carefully inspect matters for themselves. Even the pleasure-seekers, tourists and such as come here for temporary enjoyment appear to be less credulous than formerly, discounting much that is told them about California in a way indicative of a skeptical state of mind.

Such being the case, it would be well for the old resident to hereafter avoid, in his descriptions of objects and events, undue amplification. He might perhaps find it expedient to even abate something from the weights, measurements and big figures by him heretofore adopted. If he cannot consent to reduce the size of the Big Trees, he might at least consent to their honest measurement by taking their girth a few feet above the ground, instead of down at its surface, where they have been abnormally enlarged by the exposure of the roots, through the washing away of the earth around them. Certain other data, generally accepted as sound, might, perhaps, in like manner suffer some change without serious detriment to the cause of truth.

From the above remark we, of course, except the sayings and traditions that relate to the mines, all, or nearly all, of which are well authenticated. When it comes to mammoth nuggets, big strikes, heroic deeds and blood-curdling adventures, as recorded of the mines and miners, we have no concessions to make; we shall continue to insist upon their being veritable facts, and this because we know they cannot be disproved. If we exaggerate the size of the *Sequoia Gigantea*, the matter-of-fact Eastern man may whip out his tape-line and by actual measurement convict us of lying. But he cannot catch us up in that way on these mining yarns, wherefore we are bound to stick to them, probable or improbable.

But, after all, we don't see why these, our Eastern visitors, should have so captious about what we Californians have to tell them, putting a literal construction on all we say and exacting proof of its correctness. It is in no such spirit we listen to their recitals. When the Boston man tells us about Bunker Hill monument, depicting in glowing terms its height, its symmetry and its vast proportions, do we question what he says? By no means; but hearing him through, exclaim, prodigious! sorrowing that California has no such pile, and wondering if there is elsewhere in the world anything like it! When the New Englander describes to us the sea serpent that makes his annual appearance off Nahant shoals, do we shrug the shoulder or exchange with each other the knowing wink? And when the Philadelphian grows enthusiastic over the old Liberty Bell, are we the people to cry out, "Yes, but the thing is badly cracked!"

Certainly not. On these and all like occasions we have shown ourselves to be patient, tolerant and polite, expressing a due degree of wonder at what has been told us, and indulging the well-affected laugh when it was intended to be humorous. Nor have we, while exercising so much good nature, ever sought, certainly not more than once or twice with any success, to palm off on these strangers a woolly horse or a live mermaid. Amenities like these should, we hold, meet with proper recognition and appreciation, despite the modicum of untruth and self-glorification practiced on both sides.

PLANS for the Stanford Memorial University, which have been entrusted by Senator Stanford to a Boston architect, are already in this city, and work will be commenced on the site chosen in a short time. The Eastern architect will superintend a portion of the University's construction, and home talent will be employed,

Interstate Commerce.

The topic of the hour is the probable working of the Interstate Commerce bill and its effect on local affairs. The importers do not like the high freight rates, but the local manufacturers and artisans do. Opinions, therefore, are apt to be biased by personal considerations. On the 4th inst. the bill goes into effect, and it will not be very long before we will be able to decide whether it is generally favorable or not to this city and coast.

The present outlook seems to be that San Francisco will be to a certain extent placed in the position she was before the railroad era. Her merchants and manufacturers will not have such sharp competition with Eastern centers, by reason of high railroad rates. This city can get goods by sailing vessels around the Horn in the old-time way, by the Panama steamers, or perhaps by the Canadian Pacific R. R. and connecting steamers. None of these routes are affected by the provisions of the Interstate Commerce bill.

It is claimed that the wine-makers, fruit-raisers and canners, and some other home producers, will be cut off from the Eastern markets by the new order of things. But many other branches of industry here, now languishing, will receive renewed impetus. The makers of boilers and engines, the foundrymen and machinists, and other branches of manufacture, will be benefited, since the high rates of through freight will keep out much Eastern competition.

It is well understood that the great extension of our railroad systems destroyed to a certain extent the geographical advantages of some cities. Great seaport and river cities have not the advantages as centers that they had before railroads became so general. But the provisions of this bill in a measure restore the previous conditions. If the roads must make certain charges for long hauls, and do only a retail, not a wholesale, business, so to speak, the seaport and river cities have a better chance as distributing points. It is hoped that, under the new conditions, San Francisco will regain some of her lost trade. That she will be called upon to supply a larger area than has been the case of late, is very probable. Certain classes of goods can come by sailing vessel very easily, and at greatly reduced cost. Heavier stocks will have to be carried, of course, for supplies will take longer to arrive than by rail.

It is pretty certain that high freight charges by rail will be of great benefit to certain classes of manufactures. It is probable, too, that other branches of manufacture can be established in California to more advantage than formerly. If this is the case, great benefits will result. Of course, the greatest good to the greatest number is to be wished for, and while some may suffer, others will gain. In a few months we will be better able to judge of the merits of the new law.

COAL IN SAN FRANCISCO.—As to coal in this market, a local circular says: A better feeling has been shown, and asking prices have been advanced materially, as foreign vessels cannot be induced to carry coal at the freight rates current last year, unless wheat-shippers do some forward chartering and at covering rates; for the moment nothing is being done for future, so that all foreign coal now loading must be well paid for. The last Australian mail adds a few new names to the list, and owners show no disposition to seek this port, preferring to take their chances for better outward freights at other ports, as the large amount of disengaged tonnage here and current rates discourage them. The present status of the coal market is particularly advantageous to our coast coal-producers, as they are getting full prices for their output and find ready sale for all they bring to market; they are further benefited by being able to secure carriers at low rates.

Foundry Notes.

Seven of N. S. Keith's electrical motors are now being built, and are nearly completed, at the San Francisco Tool Co.'s works in this city. Two of these motors are to be used on the Folsom-street car line to run the cars by electricity.

The new Logan & Wisco machine-shops at Cottonwood, Shasta county, which have been in course of construction for the past four

will be stopped by the increased railroad freight, so that the shops on this coast will have more to do.

At the Union Iron Works a small steel steamer is being built for Yerrington & Smith, at Lake Tahoe. She will be used on the lake.

The Hammond Steel Manufacturing Company has in contemplation the establishing of two steel rolling mills—one in Oakland and the other at North Beach, this city. It is stated

PLAN OF CONCENTRATING BUDDLE.

months, were started up this week. A foundry will also be run in connection with the shops. These are said to be the most complete works in Northern California. The purpose of the enterprise is mainly the manufacture of an im-

proved thrashing machine. It is said about 150 men will be given employment.

Four new locomotives are to be built at once at the Southern Pacific Company's Sacramento shops. Twenty-five caboose cars have just been finished, to take the place of the hothead cabooses. Forty first-class passenger cars are in course of construction. Four powerful locomotives, for use on the heavy grades in the Sierra, have just been completed.

BUDDLE FOR CONCENTRATING SULPHURETS.

proved thrashing machine. It is said about 150 men will be given employment.

Four new locomotives are to be built at once at the Southern Pacific Company's Sacramento shops. Twenty-five caboose cars have just been finished, to take the place of the hothead cabooses. Forty first-class passenger cars are in course of construction. Four powerful locomotives, for use on the heavy grades in the Sierra, have just been completed.

Local foundrymen are hopeful of benefit from the new Interstate Commerce bill. A great deal of Eastern machinery has been sent here of late and sold at low prices. It is thought that much of the shipments of this character

and machine-shop in Chihuahua, Mexico, where engine for mines, etc., and all necessary machinery can be built.

The issue of standard silver dollars from the mints during the week ended March 26th was \$432,387; during the corresponding week of last year the amount was \$439,496. The shipments of fractional silver coined since March let amounted to \$352,008.

The Navy Department is still seeking to ascertain the relative capacity of railroads and canals to transport torpedo boats and naval material from sea to inland waters.

Sewerage Systems.

It is an evidence of decided advance in sanitary reform to see many of our coast towns so earnestly preparing to improve their systems of sewerage. This is a subject which has received very little attention in the laying out of towns in California. No general systems have generally been adopted. In most cases, after the cess-pool period, private sewers have been constructed and afterward the general public sewers have had to conform, in a measure, to the private ones. In the many new towns being laid out in this State now, however, the sewerage systems are carefully considered. In the older ones, where improvements are going on, more care is being taken. The Board of Trustees of the city of San Diego have telegraphed to the noted sanitary engineer, Geo. E. Waring, Jr., to come and lay out their system of sewers, his compensation to be six per cent of the cost and his expenses. This shows that the city is bound to have the best it can have in the way of intelligent engineering advice. Los Angeles is moving in the matter of a sewerage system. San Bernardino citizens are to hold a special election for the issuance of bonds to build sewers. In this city prominent citizens have addressed the mayor and asked him the probable cost of putting all our sewers in good order and extending the system, if system it can be called.

All this is evidence of progress and enterprise. No town or city, whatever its climatic advantages, can be perfectly healthy with poor sewers. Some physicians assert that the condition of the sewers has nothing to do with the dreaded diphtheria, but facts and experience seem to disprove this statement. People who rent or buy houses in these days are apt to inquire closely into the condition of the sewers and the plumbing. In the city of San Francisco, under the new laws, the plumbers must be licensed, and must stand an examination before the license is granted. People want intelligent men to arrange the connection of these houses with the sewers. Now that public attention is turned to improving sewerage systems generally in all our towns, we ought to have more healthy homes than formerly.

A Concentrating Buddle.

In saving sulphurets, one of the old ways—and which is to some extent still practiced—was to use a common sluice with riffles, and then to further concentrate the material collected in the sluice by means of buddles. The accompanying cut shows a buddle which is used frequently and which is described in the State Mineralogist's last report. It is circular, with concave bottom, and the discharge for the tailings is in the center, where there is a hollow iron cylinder, shown in the cut, with its top or rim even with the bottom of the buddle. In this position, everything will flow out of the buddle, but this ring cylinder is attached to an upright spindle, and by the gear at the top is gradually raised, retaining in the buddle the sulphurets as they accumulate, and constantly raising the discharge of the tailings; the arms, also, from which the brushes hang, are gradually raised at the same time by the mechanism.

The material to be buddled is delivered from above the center through six pipes at the periphery of the buddle. Very little water is used, and there is no agitation except that made by the brushes, which are constantly moving around the circle, resting on the pulp, and being dragged around by the arms.

By means of the step pulleys above, the gradual raising of the discharge cylinder and of the brushes is regulated as required for the material operated on. When the buddle is full of sulphurets, it is stopped and cleaned out. This system of elutriation with riffle and buddle does very fair work if carefully attended to, but requires considerable labor and does not save the finest sulphurets.

A boy fell down a 60 foot shaft of an abandoned mine in Nevada county the other day, and was not at all hurt. A gentleman driving along the road heard his cries, and on investigation found the boy was at the bottom of the shaft. Young Landers, on being asked if he was hurt, answered, "No, but I'm hungry, and I want to get out of this hole." A rope was obtained and he was hauled out none the worse for his fall.

MECHANICAL PROGRESS.

A New Steel Improvement Process.

Improvements in the manufacture of iron and steel come so thick and fast upon us that it is with difficulty that we can keep the run of them. The latest thing in this direction is reported in the *American Manufacturer* as follows:

There is now in use at the steel works of Oliver Bros. & Phillips, Pittsburg, a process for the improvement of steel that is giving remarkable results. The process is the invention of Mr. David Brose, and its efficiency is only equaled by its simplicity and cheapness, the material used being very plentiful and no change of any kind in either plant or appliances being necessary in its use. In working, the "purifier," as the substance used is called, is introduced in the ladle immediately before the steel is run in. The steel is then poured into the ladle on the purifier, when a violent reaction occurs, setting free the contained gases, and causing a thorough agitation of the metal, with a resultant commingling of the metal and manganese far beyond anything attainable by a mere mechanical mixer. Not only is the steel thus rendered more uniform, but experience has proven that the ingots produced are remarkably free from blowholes. This is claimed to be a direct result of the violent ebullition, which, as before mentioned, takes place in the ladle. But the most valuable features of the process are, that by its use a good steel may be made with a greatly reduced quantity of manganese, and of an astonishing softness. With the aid of the purifier it has been found that steel of excellent quality can be produced with 30 to 40 per cent less manganese than is ordinarily required, and numbers of heats have been made with even less. In speaking of the improvement, Mr. Geo. W. Bryan, superintendent of the Oliver steel plant, said:

"The use of Mr. Brose's improvement is worth more than it costs us in the keeping of our ladles in order alone. Before we adopted it our ladles were a frequent source of delay, by becoming clogged up with slag, which was both expensive to remove and aggravating. But the arrangement of our plant was such that it could not well be avoided, but since the adoption of Mr. Brose's purifier this trouble has entirely disappeared. The slag is now very fluid and runs freely from the ladles, leaving them perfectly clean. Again, we can now run with about one-half the ferro-manganese we formerly required, at the same time producing a steel of a softness that is simply wonderful."

The process has been in use for several months now, and we expect to be able to give further details in the near future, when it has become fully protected.

A PERFECT WELD WITHOUT FIRE.—A correspondent of the *Blacksmith* writes as follows: "I have never seen anything in the columns of your paper relative to making a perfect weld of steel without fire or heat. A job came to my shop a few days ago in the shape of two pieces of three-quarter inch round steel, welded together end to end. A taper plug of steel was in one end of a shaft on which a corn burr was running. The plug of steel was bearing against a like piece of steel in the frame, the object of this being to tighten the burr. Owing to a loose box on the shaft, the shaft got to jumping, giving a side motion and creating friction enough to weld the two pieces of steel together as stated. The two pieces of steel were hardened."

[It is not a very uncommon thing for a steel spindle in a spinning mechanism, when running at great speed, as it does in a steel cup, with perhaps a little wobbling, to suddenly stop its motion and become thoroughly welded to the cup. Of course, this can occur only when the oil in the cup is exhausted.—EDS. PRESS.]

STEEL RAILS.—The railroad companies, says the *Philadelphia Record*, have found from experience that there is much difference in the quality of steel rails. The Chicago, Burlington & Quincy Railroad Company wants to buy 20,000 tons, but it wants the rails made of material in which there is 20 per cent of charcoal iron, and in addition it wants a five-year guarantee of the wearing quality, and it wants to decide for itself whether the rails fulfill the conditions required. The late Mr. Vanderbilt bought English rails and paid the tariff on them, because they would outwear the rails of American make. The steel mills of the country are turning out a better quality of rails, in consequence of larger experience. They find that they must have proper ores, and the Eastern mills are using large quantities of foreign ore in making their Bessemer pig.

THE HEATING POWER OF GAS.—A series of tests has recently been made by Dr. Fischer, the well-known German chemist, showing that in ordinary domestic stoves in use not more than 20 per cent of fuel consumed is really utilized for warming the rooms, whereas, with stoves burning gas, 80 per cent and more of the possible effect is obtained. In a sugar manufactory at Elsdorf, it is stated no steam engines have been used for several years. Gas is made at a cost of about 10d. per 1000 cubic

feet, and it is used for lighting and driving gas engines. At the Essen Works water gas is made at a cost of 4d. to 8d. per 1000 feet, and serves both for fire and lighting.

ELECTRICITY FROM BELTS.—Once in awhile an iron saw table will get charged with electricity to such an extent that it is unpleasant to work at it. Sparks six inches long don't feel very pleasant to the knuckles, or, when stooping down, to the face. The electricity is probably caused by friction of the belt, and it is easy usually to carry it off by connecting the bench with the water pipes by means of a wire. In shops where they don't have water pipes the wires may be connected with the steam pipes, or run into the wheelplet of water. Anything that will carry off the current as fast as produced will do the business, and if so desired, it may be taken direct from the belt by putting a wire close to it, said wire carrying a dozen or two sharp points within two inches of the belt. Some overhead belts need to be fitted with these conductors, and we have seen sufficient current thus gathered to run 16-candle power incandescent lamp. It was not, however, a very good light, for the current was very variable and unreliable.

LARGE OR SMALL BOILERS.—Mechanical engineers are taking greater interest in large boilers than ever before, remarked an engineer the other day. "They see points of advantage in placing, say, a 320-horse power boiler in a shop in preference to, say, four 80-horse power boilers. First, there is a saving in heat, since the loss by radiation from the walls of a 320-horse power boiler is only slightly greater than from the walls of an 80-horse power. Then, again, there is a saving in firemen's wages, for one man generally attends to a boiler, however large it may be. Furthermore, there is a saving in firing, through less frequent disturbance of steady and economical combustion; there are only about half the number of doors to be opened for the passage of cold air while replenishing the fire. The accepted practice now is to use large boilers for driving the machinery, and generally for all other purposes where more than one boiler is needed."

POWER FROM SHAFTING.—A firm which makes a specialty of the erection of shafting, states that its experience teaches that the loss of power due to improper conditions in the line shafting amounts to 50 per cent of the engine power employed, and that the defects most commonly found are as follows: shafting too light for the duty, crooked shafting, hangers too far apart, hanger bearings too short, pulleys too heavy and not properly balanced, hangers which are not adjustable and not self-adjusting, and sometimes filled with spurious habbit metal, and improper proportion between two pulleys connected by the same belt.

THE WORKSHOP OF THE WORLD.—The fact that England is the workshop of the world can only be appreciated by a ride through it and by the thousands and tens of thousands of factories which one sees by a trip across it in any direction. There are about five persons there engaged in manufacturing to one engaged in agriculture. The statement is made that all the varied machinery of Great Britain now operated by steam-power is capable of performing more work, and hence producing more products, than could be produced by the labor of 400,000,000 able-bodied men—a greater number than all the able-bodied men on earth!

A NEW IRON REFINING PROCESS has been reported at St. Louis. It is a pneumatic process, as yet only in its experimental state; but a practical experiment is soon to be made in that city. It is claimed that by this process the quality of wrought iron can be enhanced 40 per cent. The principle is comparatively simple. The raw material is first acted on in an ordinary Bessemer converter, but before the recarbonizing process is completed, it is transferred to a revolving reverberatory furnace.

POSITION OF SAWS.—Many improvements have been made in the hand-saw, but one has just come to light by a millman who must have noticed how the hand-saw is held in the hand of the joiner; it is always leaned forward as it cuts easier, runs smoother, and can be kept on the line without any trouble. The hand-saw is made to do likewise by tilting the whole frame in a forward direction.

IN THE MACHINE-SHOP old methods of work and procedure must not be retained from an excess of conservative sentiment, when it is obvious that they have been superseded by improvements, and machinery must not be retained in work, though intrinsically in good condition, when mechanical invention has rendered it virtually obsolete.

LOAD FOR WIRE ROPES.—A proper safe working load for wire ropes is as follows: One-half inch in diameter, 1000 pounds; five-eighths rope, 1500 pounds; three-fourths rope, 3500 pounds; one-inch rope, 6000 pounds. This is for 19 wires to the strand, hemp centers.

WEAR AND TEAR OF LOCOMOTIVES.—Mr. Webb, of the London & Northwestern Railway, England, stated in a recent speech in London that a new locomotive is placed on that road on the average every five days to repair the loss caused by ordinary depreciation.

SCIENTIFIC PROGRESS.

The Explosion of Meteorites and Cause of Thunder.

M. Hirn has communicated a lengthy paper to *L'Astronomie* in which he discusses the various phenomena accompanying the explosion of meteorites, and incidentally the cause of thunder. We give below a brief synopsis of this interesting paper from a late number of *Nature*:

M. Daubree, a long time ago, pointed out how very striking and difficult of explanation the noises are which are often heard in connection with the passage of meteorites, and called in question the explanation which had been given of their being really due to a veritable explosion.

M. Hirn, in his paper, begins by considering the causes which are at work in the production of the thunder which accompanies electric discharges, and of this he writes as follows: "The sound which we call thunder is due, as everybody knows, to the fact that the air traversed by an electric spark, that is, a flash of lightning, is suddenly raised to a very high temperature, and has its volume, moreover, considerably increased. The column of gas thus suddenly heated and expanded is sometimes several miles long; as the duration of the flash is not even a millionth of a second, it follows that the noise bursts forth at once from the whole column; but for an observer in any one place it commences where the lightning is at the least distance. In precise terms, the beginning of the thunderclap gives us the minimum distance of the lightning; and the length of the thunderclap gives us the length of the column. It must be remarked that when a flash of lightning strikes the ground, it is not necessarily from the place struck that the first noise is heard." M. Hirn then gives an interesting case which proves the truth of this remark.

He next points out that a bullet whistles in traversing the air, so that we can to a certain extent follow its flight. The same thing happens with a falling meteorite just before striking the earth. The noise actually heard has been compared to the flight of wild geese or the sound produced when one tears linen. It is due to the fact that the air rapidly pushed on one side in front of the projectile, whether bullet or meteorite, quickly rushes back to fill the gap left in the rear.

The most rapid cannon shots scarcely attain a velocity of 600 meters a second (over 1500 miles per hour), while meteorites penetrate the air with a velocity of 40,000 or even 60,000 meters per second; and this increased velocity gives rise to phenomena which, although insignificant where cannon shots are in question, become very intense and important when we consider the case of the meteorite. With that velocity the air is at once raised to a temperature of from 4000° to 6000° C. The matter on the surface of the meteorite will be torn away by the violence of the gaseous friction produced, and will be vaporized at the same time by the heat. This is undoubtedly the origin of the smoke which meteorites leave trailing behind them.

We have, then, precisely as in the case of lightning, a long, narrow column of air, which is expanded, not so instantaneously, certainly, as by lightning, but at all events in an extremely short time and through a great length. Under these circumstances we should have an explosion in one case as in the other—a clap of thunder followed by a rolling noise more or less prolonged. If a cannon-ball could have imparted to it a velocity of 100,000 meters per second (nearly 250,000 miles per hour), it would no longer whistle—it would thunder, and at the same time it would produce a flash, as of lightning, and would be instantly burnt up. M. Hirn depends upon this line of reasoning to show that meteoric thunder need not necessarily have anything to do with an actual explosion. He then points out that the intensity of the noise produced in every point of its trajectory depends, first, on the height; second, on the velocity of the meteorite; third, on its size; and fourth, on the configuration of the country over which it passes. He refers to the observation of Saussure that a pistol fired at a height of 5000 meters makes very little noise. He then points out that at a height of 100,000 meters the density of the air is reduced to the small value of 0.000,000,004 kgr.; the temperature being supposed to be 200° C. In such a medium as this a meteorite could produce no sound, although it might give out a very brilliant light, because its temperature and light depend, not on the absolute value, but on the rapid change of density.

HOW STEEL IS CONSTRUCTED.—Some important researches into the inner structure of cast steel were recently made by Messrs. Osmond and Worth at the Creusot Iron Works, France. From the steel a plate was rolled as thin as possible and then put on a pane of glass. Next it was treated with nitric acid, whereby the iron was dissolved, leaving the carbon in the condition it occupied in the iron. When this skeleton was examined with the microscope it was discovered that the carbon is not at all distributed evenly throughout the mass, but that the steel consists in its inner structure of tiny particles of soft iron inclosed in cells formed by the carbon. These cells are again distributed in the iron, either combined or as a collection of cells, having considerable open spaces between them, so that such a plate or sheet of

steel may be rolled until it becomes transparent. These spaces are irregular in shape, and may in the raw material be almost noticeable; but they are reduced in proportion to the treatment to which the steel is subjected, either by rolling or hammering, as naturally the homogeneity is increased.

PHOSPHORESCENT BIRDS.—A correspondent of the *Scientific American* relates the following: "In reading of the habits of the wading birds, and particularly of the crane, I do not find that naturalists give any account of their manner of attracting their prey at night. My attention was called to the matter while gigging for fish, by frequently observing dim phosphoric lights appear and disappear along the shore like jack o'lanterns, which I for a long time supposed them to be. On one occasion I fired at such a light, and brought down a large blue crane, on which the phosphoric spots were clearly visible after death. There are two such spots, the larger being high up on the breast and the smaller at the bottom of the breast bone, the bird having power to reveal and conceal them at will. I have since stuffed many of the water walkers, and find that all have the same general arrangement of the feathers, and, as I believe, the same power of lighting up the water to attract the fish. Will some naturalist who is posted on this subject please throw some further light upon it for the benefit of science?"

RING-SHAPED ATOMS.—Among the most interesting results of recent chemical investigation must rank our recognition of the fact that there exist certain so-called "ring-shaped" groups of atoms, like those of benzol, naphthalene, anthracene, and pyridine, which are widely distributed, and which are formed with exceptional readiness. Among these, according to two German investigators, a peculiar interest attaches to that ring which exists in anthracene, and which is characterized by having two phenylene groups connected by two groups of atoms, which, in the benzol residues, take up the ortho position to each other, so that with the carbon atoms in question they form a third ring of six members. Two compounds analogous to anthracene and acridine have been investigated in the Heidelberg Laboratory. These compounds, like anthracene, produce beautiful coloring matters. These observations have suggested that further investigation should be made in the same directions with a view to the production of other economic values.

INCENDIARY BIRDS.—Incendiarism is a new charge to bring against any member of the feathered tribe, but this is what a *Scientific American* correspondent says of the mischievous little English sparrow which has become so thoroughly at home in this country: "I write to relate an incident which may be of interest to some of the readers of your valuable paper. There is a bar-iron mill, situated in a neighboring town four miles from here, that has been on fire three or four times, in which the English sparrow might be called the incendiary. These sparrows pick up old pieces of cotton waste, which they build in their nests among the timbers of the roof of the mill, and in every case of the fires above mentioned these nests were the cause, either from spontaneous combustion or from sparks from the hot iron striking and lodging in the nest. If you could suggest some way of getting rid of the sparrows, I think the manager of the mill would be glad to adopt your plan."

FRUIT DEVELOPMENT.—The cause of the increased fertility in the limbs of fruit trees, where the limbs are bent to an acute angle, has recently been investigated by Prof. Soraner. He finds that the bark on the lower surface of the twig, below the bend, is thrown into transverse folds, here and there detached from the wood. New woody tissue is formed in the cavities produced by such folds, which is filled with starch grains, and after this there is a formation of a new woody tissue of a normal character, but always thicker there than elsewhere, and especially on the upper curve of surface. This mass of woody tissue checks the flow of water toward the tip of the branch, to the great advantage of the bud directly beneath, which is thus more likely to develop as a fruit bud.

THE CAUSES OF PAPER TURNING YELLOW.—Prof. Wiesner says that the yellowing of paper is due to an oxidation determined by light, and especially by the more refrangible rays. This discoloration is more striking in wood papers than in rag papers. Dry air is another important condition for the preservation of paper. The author thinks that in libraries the electric light is inferior to gas, on account of the large proportion of the more refrangible rays present in the former.

PLANTS AND ANIMALS.—Out of more than 120,000 species of plants known to botanists only about 250 have been put to use by man; yet this proportion is much greater than in the animal world, from which only some 200 species have been selected, while the animal kingdom reckons millions of species.

ALUMINIUM GUNS.—"Aluminium would make a good gun on account of its strength, and at its present cost the Government could afford to pay the price for it and make more durable guns than have ever been manufactured," says Colonel Roberts, of Pittsburg.

Lexington.

The New Ventura County Mining Camp.

The camp is becoming lively, and prospectors are arriving every day. Some snow is left, but you can't come here with a wagon for 10 days yet. Walking is good if you want to tackle it.

R. B. Harper, a well-known mining expert, second to none in the State, has been here for the past week in the interest of a strong company. Capitalists are awaiting his decision eagerly. He has purchased the Esperanza mine, and is negotiating for another. He will leave for San Francisco in a day or two to purchase a stamp mill and hoisting works.

The Esperanza carries free-milling ore which assays \$65 or \$70 per ton. One mine in camp is sulfiteated to have a lively camp. Lots of country is not yet located. There is a good chance for a tenderfoot or anybody else. The Brown mine, owned by Menzies, Wilhoit & Bibb, has a ledge traceable for three locations. There is a 75-foot tunnel. The face is full of rich free-milling ore. There is a 68-foot shaft. The ledge stripped for 1500 feet. One thousand tons of ore are on the dump. The same parties own the Golconda, a 30-foot vein of silver and gold, with a 150-foot tunnel. The General Lee, silver and gold, has a 75-foot tunnel. The Double Standard is on a 3-foot ledge of rich ore which assays "way up." Smith & Grover have five locations, with millsite adjacent to all. The Exchange is on a 42-foot ledge, with a 9-foot vein of gray copper ore running \$4.25 per ton in a 10-foot shaft. There is also a 160-foot tunnel, with a 60-foot shaft at the head that contains a 5-foot vein of iron sulphurets running high in gold. The Matchless is on a 9-foot vein, running \$42 in gold. The Carbonate Prince has a 4-foot ledge and nine smaller ones in 400 feet. The Carbonate Queen is on a vein of carbonate ore, very rich. The Carbonate King has three pay streaks; the first, a green, bromide vein of 13 inches; the second, a vein of lead carbonates, 18 inches wide; the third, a 9-foot pay streak rich in gold and silver. The Castac mine is owned by Hall & Frazier. A 7-stamp mill is now running. There are 800 tons of ore on the dump and it is a very rich mine. Capt. Kelle and Capt. More have a very rich prospect with a 20-foot tunnel. William Aram has several ledges assaying from \$8 to \$150 in gold and silver. DeMoss Bowers has a rich prospect in the Annie and Silver King claims. Placer mining is averaging \$5 per day for each man. Stores, a restaurant, grocery, etc., will soon be erected.—*Los Angeles Times*.

THE PLACER MINERS.—It is evident that some of the miners about Georgetown, and perhaps in some other parts of the county, are hostile to the movement toward securing immigration and the settlement of the county, as they fear that titles will be obtained to the land and their prospecting privileges will thus be curtailed. They look at this in a wrong light, however, and from a very impractical standpoint. We are just as strongly opposed as they are to land-grabbers getting titles to mineral land, under a pretense that it is agricultural; but the right way to oppose this is not to insist that the land in El Dorado county is of little or no value, except for mining. Such a theory cannot be maintained. It is admitted by all that the palmy days of placer mining are over. There is considerable to be done yet, and there will probably be new mines discovered here and there, by which the industry will be kept alive for many years; but the mining future of the county must be looked for in quartz and deep gravel mines, instead of the more easily discovered placers. The right way is for our miners to obtain patents to such land as they are willing to pay for as mineral, and then they can prospect without interference. If the land is not worth paying for under the liberal rates allowed by the Government, it is certainly not very valuable for any purpose whatever. One thing they should regard as inevitable: The lands will be taken, either for mining or agriculture, and they have but little time to lose. Sooner or later railroads will be built and people will come in to make homes. We have no wish to belittle mining nor to say one word in opposition to the very natural desire which miners have to continue their industry, but we state what all will acknowledge to be facts, when we say that if they wish to mine, they must soon obtain patents to the land.—*El Dorado Republican*.

A PERFECT MARBLE.—As was predicted from the beginning, the more the Lugo marble quarry is developed, the stone is found to be of finer quality. A correspondent writing from the quarry says: "The seams are as straight as a line and run perfectly parallel. The upper layer is about 20 feet thick; the second 3½ feet thick. The third layer has been uncovered but not cut through, and its thickness is not yet known; it may be 3 feet thick, or it may be 20 or more. One thing is certain, it is a solid layer and in its original place in the formation. There has never been on the market a better marble than that we have here, if it was ever equalled; or a quarry that will compare with this in its possibilities. The Vermont and Italian are good marbles, but are not to be compared to this in color, durability, purity of composition or strength." The new mill is working well and is rapidly sawing out marble for the market, all of which is taken as fast as offered.—*Inyo Independent*.

USEFUL INFORMATION.

Unsound Manufactures.

One of the crying evils of the times, and one which is working great damage to our producers of whatever character for both our home and foreign markets, is the inclination to place cheap goods on the market, and in doing so the limit of true economy and prudence is left far behind. The clothing which the great majority of people buy is poor stuff. It looks well at first, but soon fades, comes to pieces, or wears out. It takes about three suits to do the legitimate service of one good one. A large amount of shabby gentility, so far as appearances go, is the consequence, and it contrasts unfavorably with the stout and appropriate garments used by the masses in Europe or by the people of a generation ago anywhere.

The unsound manufacture also extends to wagons, agricultural implements, furniture and many other articles in common use. The frequent remark is that it is difficult to find any of these things which are up to the old standard of excellence. A lack of confidence in chairs is experienced by heavy people which did not exist some years ago, and good old housewives mournfully shake their heads at the degeneration of fabrics in which they are interested.

In California this disposition is mainly manifested in cheap dwellings and unfair fruit-packing. A lot of raisins packed in one of the interior counties was recently found with good layers at the top and bottom, with a middle layer of perfectly useless or rotten raisins. Fruit frequently comes to this market fair upon the top but very inferior below. Such things tend greatly to the injury of trade, and should be sought out and exposed wherever possible.

Much of this imperfection in manufactured articles is attributed to the increased use of machinery, but as machinery is not responsible for the kind of material used, the reason is not adequate. The truth is that there has been a wave toward flimsiness and apparent cheapness in houses, clothes, and pretty much everything else, but there is a fair hope that it has about reached its limit, and that, under the influence of prevailing experiences, the current will soon set the other way, as it has already done in some particulars.

Saving Wool Waste.

Woven and other wool waste has long been worked up and utilized by means of a machine similar in principle to the ordinary wool-carding machine; but there are certain portions of such waste, sometimes known as "hard-end wool stock," "hard-twisted yarn," as yarn or in the shape of woven and especially worsted goods, which the ordinary machine employed in disintegrating such stock will not properly work up. To meet this deficiency, a Mr. Garnett, of England, some time since invented a machine which bears his name, and which does good work. This is a comparatively new machine, but it is becoming an indispensable adjunct in the manufacture of woolen goods in English mills, and is destined to have a more prominent place in American mills. The machines are made similar in principle to the common wool-carding engine, but everything about them is more rigid and of heavier material.

As already said, the invention is an English one, but it is also made in the United States by a Philadelphia concern, and in every way equal to its English prototype. The invention has been a boon to the woolen-manufacturing industry by allowing the putting of hard-twisted yarns into a condition suitable for the finest manipulation on the carding engine. The Philadelphia concern has added some improvements to the Garnett machine, and by certain carding attachments the stock is delivered in a more perfect condition than before. The first machine of this kind has been recently set up in a Connecticut mill, much to the cation of the users.

Journals and Bearings.

When allowance for oil space is made, says a contemporary, the fitting should be as carefully made as though the one surface was to be driven on the other—that is, the bearing should be cylindrical as well as the journal. The surface should be fitted up with a scraper, where the bearings are large, and brought to a uniform fit. Fitting so that the journal is a true cylinder, while the bearing is bored a double cone-shape, or elliptical in cross-section, would never do. The journal would press through the oil at the high place on the small parts of the cone, and there would be abrasion. But by the use of a scraper or file, or both, after the lathe work is done, the bearing and journal may be brought to a near fit, so that the needed film of oil will have a uniformity of thickness along any line lengthwise, and he but slightly crescent-shaped, with true circle outlines in cross-sections through the bearings. Such a bearing will be expected to run cool, while the bearings, which "will soon wear to fit," will not run cool. In the latter, a cool bearing seems never to be possible, because at first wear is expected in place of scraping, to reduce the points to be worn off, and such wear requires contact of bearing and journal. That contact will injure the journal, making it rough, which in turn will cut the bearing rudely. Now, by the time some degree of evenness is imposed to

be gained there will be too much space for the oil. The shaft will then tumble about, knocking against the bearing with such force as to cause metal contact and rubbing. Both of these actions produce heat as well as continue in aggravation the cause of that heat. In short, in order that machinery bearings and journals shall be correct, they must be made right. The "wear to fit" is utterly out of the question in first-class work; that is to say, fine journals and bearings do not grow like weeds, but must be the result of skill and good judgment as well as other things.

IMPROVEMENTS IN LEATHER DRESSING.—Various ingenious and important improvements have within the last few years been introduced into the process of leather dressing. The old-fashioned "splitting" machines have been greatly improved, and a new kind of machine, known as the "band knife," has been introduced with marked success. Hand labor has, moreover, been largely superseded by various machines of ingenious construction having that end in view.

PATENT LEATHER is coming into fashion again for men's and women's fine shoes. Some 15 or 16 years ago, balmorals, in fancy foxing and patent heel pieces, were largely worn by women, and there is every probability of a good many being made this season. Gentlemen are wearing patent tops for street wear with double soles, as the ordinary polished grain dulls under the overshoe and destroys the dressy appearance accessory in making oaks.

SHOE PEGS were invented in 1818 by Joseph Walker, of Hopkinton, Mass., but, as usual, the honor is claimed by others as well. Hard maple and birch is much used, the latter being the favorite, the chief object being to get some hard, close-grained variety of wood which splits easily. Germany imports large amounts of shoe pegs from the United States.

BOILER FLUES.—A correspondent of the *Stationary Engineer* asks, "Why must the flues in a horizontal boiler be covered with water, and the flues in an 'upright' be partly exposed to the heat?" The *Engineer* does not answer the question.

A FEW oyster shells, mixed with the coal used for a furnace or large stove, will effectually prevent the accumulation of clinkers.

A POWERFUL PUNCH.—A punch has just been made that will punch six holes at one time through one-inch thick splices.

SIXTY-FIVE varieties of lettuce are known to horticulturists.

GOOD HEALTH.

How to Promote Health.

After all that has been stated of the effects of the atmosphere in high altitudes or at the level of the sea, the influence of forests and ocean, of sea coasts and interior places, humidity and dryness, cold and heat, the winds, electricity and ozone, and no matter what of other conditions, the paramount considerations for the promotion of health are an abundance of pure air and sunshine and outdoor exercise. Without these, no climate is promotive of health or propitious for the cure of disease; and with them, it is safe to say, the human powers of accommodation are such that it is difficult to distinguish the peculiarities of any climate by their joint results on the health and longevity of its subjects.—*Bell's "Climatology."*

The above is well and truly said, and the most important of the three requisites enumerated is "outdoor exercise." Going to the springs, going to the seaside, or going to the mountains is all good for invalids; but going into the garden in any reasonable kind of a climate and working in the ground with the hoe or spade moderately, but with sufficient outlay of strength to produce a reasonable degree of perspiration, for one, two or three hours daily, will do more to promote health than either medicine, springs, seaside, or mountain. We have tried it and know of what we write. We have witnessed the beneficial effects of moderate exercise of that kind—work—in others, and we know that it is of more value and infinite less cost than the best mineral springs that ever existed. The great trouble with by far the large majority of invalids is lack of exercise of the right kind—of work that will make the sweat start and flow freely for one or two hours daily.

The writer once left San Francisco and spent nine months in traveling, and came back but little better than when he went away. He then put on a suit of old clothes, took a hand trowel, got down upon his knees, and dug in his garden, in this city, three or four hours a day, and in six weeks completely regained his health.

Another instance: A young man left London, England, a few years ago, and spent one year in traveling, reaching this city in the spring of the year, but little better than when he started. Having been told of our own experience, he went up to Haldsburg, in this State, went on to a ranch and commenced work, when he was not able to use the hoe or spade more than two hours out of the 24; but he persevered, and in less than six weeks he was able to

do a fair day's work. He returned to this city a well man, and went directly to London. He dug his health out of California soil. Thousands of invalids might do the same thing if they would; but to most invalids it is hard medicine to take, and they neglect it, oftentimes to become confirmed invalids, or to meet an untimely death. Exercise—not with dumb-bells, or in any way in the gymnasium, but in the open air, in the form of work, turning up the soil, is the best promoter of health that can be devised.

Good Health Talk.

In ancient as well as modern times, that class of people who disregarded the laws of health have rapidly degenerated into the grossest sensuality and intemperance. Intemperance in all its forms has especially marked their path. Pagans who despised the body came in upon our ancestors like a flood of corruption. Our disregard of the laws of health is not of Christian or Jewish origin. The Christian religion adds to the length and vigor of life, because it requires a rigid adherence to the divine law for the body; hence it is sanative and curative, tending to long and satisfactory life. Look at the hosts of God entering Canaan with not a feeble one among them, an army without hospital or ambulance. This was the God-decreed natural consequence of their obedience to the Jewish sanitary law which makes such full provision for health. It was no mysterious providence, no arbitrary reward, but the simple operations of laws which are as good to-day as then, and in the keeping of them there is the same recompense.

Do you think it matters only to whimsical people whether the hour for retiring be early or late? Whether the food be easy or difficult of digestion? A deaconess at a church Thanksgiving dinner said: "Mince pie and cheese always make me sick, but I like them and I will eat them sometimes." She had had surgical treatment for a disease which was directly aggravated if not excited by such food.

The family table stands in the inner court of the home temple. Priest and priestess should guard the integrity of its supplies. One of the headwinds of intemperance is unwholesome and insufficient diet. Men try to supply in drink what is lacking in their food. Especially to be condemned is the sinful practice of pepperiag food for children. Leave pepper and hot sauces for the palate that has become calloused by abuse, but respect the delicacy of child taste. Many a boy goes from his mother's table with the taste for strong drink already formed by what he found in the castor. Another important tributary to the stream of intemperance is the late bedtime of children; even the babies are kept up and dressed during the evening if their mothers have callers. This cultivates a love of excitement, the most subtle of stimulants from the cradle. The child associates gaslight with a good time, and loses the best hours for sleep, thus interfering with healthy growth. Nothing can more completely subvert our efforts for temperance than the social customs which cut short the hours of sleep. The child is injured for life by such customs, and the young man who dances until one o'clock feels the need of "something" to take the place of three hours of sleep.—*Ventura Free Press*.

PREVENTIVE MEDICINE.—Dr. C. R. Illingworth thus writes in the *Med. Press*: "One of our great aims as physicians is to prevent disease; another is to cut short its course when developed. Our power in these directions finds full scope among that class of disorders now generally recognized as depending upon the reception, growth, and development in the tissues of micro-organic life in one shape or another. By the continual suppression of the growth and development of these forms of cell life, we may, indeed, hope at length to erase the names of the diseases they cause from the category of those 'ills that flesh is heir to.' The diseases I refer to are scarlet fever, diphtheria, measles, whooping cough, rheumatic fever, chicken-pox, small-pox, syphilis, hydrophobia, yellow fever, *et hoc genus omne*."

THE TELEPHONE AS A SOURCE OF INFECTION.—At a meeting of the Caucasian Medical Society, Dr. A. P. Astvatzaturoff, of Tiflis, drew attention ("Proceedings of the Caucasian Medical Society," November 17, 1886, p. 263) to the danger of infection arising from the promiscuous use of the mouthpieces of public telephones. To prevent any accident of the kind, he recommends that the mouthpiece should be disinfected every time after, or, still better, before it is used. In other words, some disinfectant fluid should be kept at every telephone station, and the speaker should, first of all, dip the mouthpiece in the fluid and then wipe it with a clean towel.—*Brit. Med. Jour.*

EVILS OF OVEREATING.—Sir Henry Thompson thinks that more than half the diseases embittering life are due to errors in diet, and that the mischief done in the form of shortened life is greater from indiscriminate eating than from the use of alcoholic drink. An over-supply of nutrition, which must go somewhere, produces liver disease, gout, rheumatism, and various other disorders. To eat too much is a blunder, and to wash down nutritious food with nutritious drink is one of the greatest dietary indiscretions that can be indulged in, especially for persons of sedentary habits.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, March 26: This mine is being put in good working condition as fast as possible. Work has been started on the north shaft, with the intention of making connection with the old works at the 600-foot level. This shaft is now 400 feet deep. When connected it will be of great service in the way of ventilation. It will be continued to the deeper levels as soon as possible. The mine is in a fairly prosperous condition. The ore is low grade, but reaches the paying standard, and by getting the property in a thoroughly equipped condition for efficient working, the owners expect to realize a small but steady profit. The mill crushes about 90 tons per day. The mine and mill give employment to 75 or 80 men.

MADDERN MINE.—J. B. Gluyas, a mining expert, gives the following report of a recent visit to this mine: The Madden mine is situated about seven miles east of the town of Jackson, Amador county, and about one and one-half miles from the Amador canal tunnel. Mr. Madden intends to run a tunnel at or about 200 feet above the level of the canal mentioned above, which would give 500 feet of backs. There is an excellent millsite just below said canal, where sufficient water for all milling purposes can be had.

MISCELLANEOUS.—New grizzlies are to be placed in the Kennedy mill at once. H. G. Murray has the job of putting them in, and the work will take two or three weeks to accomplish. Knight & Co. have the contract for putting in another steam derrick at the Arroyo Seco gravel mine, near Irish hill, Lone valley. The one in use, and built, and indeed invented by the same firm, has given excellent satisfaction. It has enabled the company to work the claim profitably, when the outlook previously was exceedingly dubious. A roller quartz mill is to be erected on the Goodman mine at Quartz mountain. In running a tunnel into the mountain some rock of a richer character than has heretofore been encountered in this huge mountain of quartz, has been struck, and the prospects are favorable for a busy little mining camp springing up in this vicinity. The shaft of the New London has reached a depth of 800 feet. The intention is to go 200 feet deeper, before commencing to drift. M. M. Culbert's quartz claim on Rancheria creek is turning out better than the first cleanup indicated. It is almost invariably the case that the first cleanup in a new mill does not come up to expectations. It takes experience to understand how to run any new mill with strange ore so as to obtain the best results. The Culbert 10-stamp mill is doing fairly well and strong hopes are indulged that the property will prove a remunerative one after all. The two-stamp mill of Harris & Co., near Stony creek, a couple of miles west of Jackson, is doing nobly. The last run yielded \$900, we are informed, which would give from \$8 to \$10 per ton. This leaves a snug profit after paying all expenses.

Butte.

WEST BRANCH.—*Oroville Register*, March 24: W. M. Pentz, E. C. Chase, Harry Paul and Frank Davis are running a new tunnel on Conklin ravine to develop a mine which they believe to be rich. Austin Parish and Ed Wilson have good pay gravel in their claim near Parish's place on the ridge above Pentz. The Cape Horn claim, or the George Henderson & Co.'s claim, has been bonded, and work is being pushed ahead on the tunnel, which is now in a distance of 300 feet. The Portuguese claim adjoining the Henderson mine has also been bonded, and a new tunnel is to be run upon that. The Blue Hawk mine in this same neighborhood has lately been sold and the owners have struck good pay gravel.

Calaveras.

AT ANGELS.—*County Record*, March 23: No new developments have been made in our mines during the past week. The cleanup at the Matson mill (5 stamps) yielded handsomely, the result being, we are informed, \$900. The cleanup at the Osborn mill last Tuesday was very satisfactory, indeed. A five days' run was made, crushing about 25 tons of ore. The rock is from the Glass and Dieren mine, and yields about \$14.40 per ton. The bullion received at the recent cleanup is estimated at about \$360.

El Dorado.

CRUSHING OF ORE.—*Georgetown Gazette*, March 26: Dr. Spencer is making ready to get out another crushing of ore from his mine to be worked in the Eureka mill. These occasional crushings furnish the doctor with the sinew to drive ahead his tunnel, which is the neatest and best tunnel we have seen in this district. He is now raising an air shaft.

MILL.—*Placerville Observer*, March 29: J. J. Wonderly has returned from the El Dorado mine, situated one-half mile below the Springfield, and reports that the mill which has been under course of construction for weeks past is completed, and that operations will commence on or about the 1st. Much is expected of this mine, and the operators thereof are firm in their belief that it will develop into as good a paying mine as there is in the county.

Inyo.

BIG LEDGES.—*Independent*, March 19: On the east side of Panamint valley is a very large ledge of antimony ore. The metal was quoted recently in London at \$150 per ton. No effort has ever been made to do anything with this ledge. On the west side of the same valley is a quartz ledge 25 feet wide that is reported to carry about \$5 per ton in free gold. This ledge crops out for a distance of several miles. In Plumas, Sierra, or other mining counties, such a ledge would be regarded as a perfect bonanza, yet here no attention is given it.

LOOKOUT.—*Independent*, March 26: At the end of last week 110 tons of ore had been accumulated at the furnace at Lookout. The amount is being added to from day to day. In addition to this, two big teams are constantly on the road, hauling ore to Keeler. It will not be possible for teams to reach the charcoal heaps on the mountains sooner than another week; this will delay the lighting up of the furnace for some time yet. Smith & Wallace are

taking good ore from the Minnetta mine. The scarcity of good miners is still complained of at Lookout. At least 20 good men would find steady employment there at standard wages.

Nevada.

QUARTZ FROM THE HORSESHOE MINE.—*Grass Valley Union*, March 26: A cleanup of 23 loads of quartz from the Horseshoe mine has just been made at Sothern's custom mill, on Wolf creek, which gave a yield of \$24.25 a load, independent of the sulphurets. There was some waste rock in the quartz, otherwise the result would have been larger. The Horseshoe folks are well satisfied, and look for good yields from the mine in the future.

Placer.

IOWA HILL.—*Placer Republican*, March 23: C. F. Hoffman, engineer of the Red Point mine, came down last week, traveling part of the way on snowshoes. He reports good progress on the tunnel, which is now in 1960 feet. They expect to commence their upraise for gravel in a few weeks. The tunnel at the McIntire mine near Damascus is in 800 feet, and the upraise already commenced. The reports from the Morning Star mine continue very flattering, and work is being pushed by Elliot West, underground foreman. A new drift over 100 feet long has just been completed to an air shaft, in running which more rich gravel was found. J. H. Neff, the superintendent, was at the mine a couple of days last week and expressed himself well pleased with the work done and the present and future prospects of the mine.

San Bernardino.

CALICO'S PROSPECTS.—*Calico Print*, March 29: Last year was the dulllest which Calico has experienced since the camp was started. The discharge of the large force of miners on the King mine, only a few being retained for prospecting, and the reduction of forces on other mines, caused a great depression in the business of the town, but still there were but few failures, and most of those parties engaged in business a year ago are yet conducting their enterprises. The time has finally arrived when the hopes of the patient will soon be realized, and business will once more become lively and money circulate freely. There is something tangible for a foundation to the expectations of the most sanguine. The commencement of work on the foundation of the Oro Grande company's new 60-stamp mill speaks volumes in itself. When the mill is completed the company will then have 75 stamps to feed with ore, which will require about 200 men to do it. This alone will give a stimulus to the business of the town. When the litigation on the Jennie Lind mine is terminated, 50 or 60 men will be employed there. The Barber Co. has been purchasing a number of mining claims in West Calico, and intend to put on a large force of men to keep their 15-stamp mill running day and night. In a few months the 15-stamp mill of J. S. Doe & Co. will finish crushing the hundreds of tons of ore which they have accumulated on the dumps, and 75 men will be required in place of the few they now employ, to keep the mill in constant operation. The mines of the Silver Odessa Co. are attaining such a depth and extent in development that a much larger force will be required to keep their 15-stamp mill busy. The rich strikes by chlorides are operating better than usual. In brief the prospects of Calico are exceedingly bright, and this fall, at the furthest, will see Calico booming at a degree far ahead of anything she has experienced in the past. Already business is improving in all quarters of the camp.

WATERLOO AND HARMONIAL MINES.—A rich strike has been made in the tunnel of the Harmonial No. 1 mine, owned by Bahten & Edwards. This mine adjoins the Waterloo on the west. An immense ledge runs northwest and southeast through the eastern part of the Harmonial No. 1 and the western part of the Waterloo, extending through the center of the Harmonial No. 2, which adjoins the two above-mentioned mines on the north. A 700-foot tunnel was started several months ago on the Harmonial No. 1 mine for the purpose of connecting with the main shaft in the Waterloo, and giving that mine a convenient outlet. Recently the miners in the tunnel penetrated the ledge, and the other day struck a fine body of ore that averages 60 ounces in silver to the ton. The strike was not unexpected, as that part of the ledge on the Waterloo ground has been yielding large quantities of good ore, and hence all claims located on that ledge would naturally be expected to contain good ore. The group of mines of which the Waterloo is the center, ranks among the richest in the camp.

IVANPAH AND MESCAL.—The Cambria Mill and Mining Company, of Mescal, have purchased the mines and mill of the Ivanpah Mill and Mining Co., and intend shortly to make extensive developments on the mines of the old company, which will keep the mill in constant operation and once more make Ivanpah a lively camp. The 10-stamp mill of the Cambria Co. at Mescal is kept busy day and night, crushing ore from the Cambria mine, which is being systematically developed, and is yielding a large quantity of rich ore. The Waterman mill and mine closed down recently, not for the lack of ore, it is said, but on account of the result of the litigation which has been prosecuted over the property for several years. The hoisting machinery on the mine has been removed to Waterman & Porter's gold mine in San Diego county.

THE TAGGART MINE.—The Taggart mine in East Calico is now owned by I. Norton and I. S. Weaver, and recently they gave a lease on the mine to Fred Heber and Geo. Johnson, who have made a rich strike on the ledge which will average about \$75 to the ton.

Shasta.

PROMISING MINE.—*Shasta Co. Democrat*, March 23: Tucker is developing a very promising mine in Old Diggings district, north of the Central. The Day mine, Old Diggings, is "tied up," on account of pending litigation between the owners. Tom Greene came down from the Gulch Monday, bringing another handsome gold brick. The 10-stamp mill on the Little Gem mine at Lower Springs was started up last Thursday. It works like a top. A Chico man is building a sawmill in Bullychoop mining district, and will supply that camp with lumber. Tom Harrison brought ore to town last Monday from Old Diggings that assayed up in the hundreds of dollars to the ton. Whit George and Mike Barnes have struck a fine prospect in blue gravel on Oregon gulch, and commenced work on the claim yesterday. The shaft at Jackass flat being sunk by a lo-

cal mining company, for a blue gravel lead, is down 50 feet. At this depth indications are favorable. The lower tunnel on the Ballakalla mine tapped a fine body of ore last week, several hundred feet in depth. They have been six months running this tunnel. Mr. Loveridge and Mr. Lawrence, of Trinity county, while in town last week purchased an interest in the Lower Springs smelting works, which occasioned the formation of a new company. We understand that the company will build a new furnace. Mr. C. E. DeForest, the metallurgist, is increasing his quartz working plant by the addition of one of his patent arastras and new machinery. He is to have an engine large enough to drive four of his mills if the necessity requires. The new plant will work about 12 tons per day and will be completed about the 1st of April.

Sierra.

WILL BUILD A MILL.—*Grass Valley Union*, March 26: A mill is to be built on the Grant quartz mine, on the Middle Yuba, at a point nearly opposite Pike City, where the famous Alaska mine is situated. A wagon road is now being graded down to the mine for the purpose of getting in the necessary lumber for the mill, which, when completed, is to be run by water-power. The prospects of the Grant are reported as excellent, the vein being strong and of good quality. Robert McMurray, of North San Juan, is one of the principal owners in the mine. Several other mills are in contemplation at that portion of Sierra county, during the coming season, either on new mines or old properties that have been idle for a number of years. Sierra county has plenty of good quartz veins, and they are generally strong and well defined.

Tuolumne.

NEW MINES BEING DISCOVERED.—*Union Democrat*, March 23: Favorable reports come from the Basin region on the north fork of the Tuolumne river. Mining has been carried on in the Basin for a number of years with varying success, but for some reason no prospecting or exploring was prosecuted on the south side of the hill that lies between the north fork and the Basin. Since Messrs. Hamilton and McCann became interested in the Basin mines they have endeavored to test the value of the mineral formations surrounding the scene of their operations. There is a heavy deposit of mineral of considerable extent inside of granite formation on the east and west. Prospecting is being pursued systematically on the southern bank of the river, resulting in the finding and locating of several claims, which thus far show very favorable. None of the claims have been worked other than sinking on them a few feet. The ore shows and yields well by the tests made. The veins increase in thickness as sinking proceeds. Ore that will assay \$1000 per ton is reported to have been taken from one of them. This range of ore matter is supposed to be a continuation of the Soulsby lead on the one side and the Confidence and Excelsior on the other. Those engaged in the development feel certain that a new district is being opened which will prove to be rich and valuable. It may seem strange that this ground was never tested before where there has been so much mining in its vicinity so many years. In a mineral country like Tuolumne such surprises may be looked for at any time. There are numberless veins that have not yet been discovered that will play an important part in the future. There is quite an extent where this prospecting is being made, and if the anticipations of those engaged in it are realized, a number of mines of value will soon be in process of development.

BONANZA IN GOLD.—*Tuolumne Independent*, March 26: We learn, from a reliable source, yesterday morning, that Oliver & Co., of the Bonanza mine, in Sonora, have taken out over 300 pounds weight of gold this week—including a piece of nearly solid gold 50 pounds—and are still taking it out. They cleaned up, last Saturday, \$6000 from a carload of quartz. From rumor, we learn that, on Wednesday, they retorted and ran into a bar 100 pounds, the amount obtained the previous week. This would make, with the above, over 700 pounds of solid gold in a few weeks from this wonderful quartz mine. Tuolumne leads!

MORE STAMPS.—We learn that an addition of 20 stamps will be soon added to the Buchanan mill, making in all 40, with ability to crush 80 tons of ore per day. The mine is making a fine showing and fully sustains its reputation as one of the leading mines in the State.

Trinity.

ORO FINO.—*Trinity Journal*, March 23: The recent spell of warm weather has started all the mines to work. The Oro Fino claims are running with plenty of water for all and some to spare, with a bountiful supply of snow to insure a good season's run.

Tulare.

STAKING OFF CLAIMS.—*Visalia Times*, March 24: Renewed excitement exists concerning the mine discovered in Yokohl valley, a year or two since, and many people are staking off claims in that section. Delbert Dillon now owns the original mine discovered by Mr. Osborne, and is taking out rock and hauling it to the Dillon flour mill, six miles east of Visalia, where it is crushed in a cannon-ball arastra. The rock is said to pay well, though the amount extracted per ton is not given. A practical miner is sinking a shaft on the mine for Mr. Dillon.

NEVADA.

Washoe District.

HAYWOOD.—*Virginia Enterprise*, March 26: At this mine 16 men are now being worked. The ore extracted is being reduced at the Thompson mill, Devil's Gate. The ore mills, just as dug from the mine without assorting, from \$20 to \$30 a ton. Another mill will be engaged as soon as one can be had. Negotiations with this object in view are now being made. Pending the securing of additional milling facilities the work of opening up the mine is continued.

SAVAGE.—The north drift on the 1200 level continues to look well. It was yesterday out in the quartz deposit a little over 100 feet. The drift is running about parallel with the deposit, with half its width in ore. The vein is still presenting a fine, strong appearance, and as far as explored shows a fair quality of ore. On the 500 and 600 levels the ore is showing marked improvement in quality, and is now very fine. On the 800 level the large body of quartz found some time ago is still being explored. This quartz gives such assays as show it to be min-

eral-bearing, and at any time a body of good-paying ore is liable to be encountered in it. The company night before last shipped bullion to the value of \$20,000, making the total shipment of the month over \$48,000.

CON. CALIFORNIA AND VIRGINIA.—On the 1300 level west crosscut No. 1 from the north drift was extended 34 feet; total length, 644 feet. East crosscut No. 1 was extended 32 feet; total length, 148 feet. On the 1435 level still continue stopping out ore from bottom of winze No. 2, 165 feet south from the south line of the Ophir mine. During the week the usual amount of ore shipped to the Morgan mill and to the Eureka mill. The average assay value of the ore worked at both the above mills during the week was about the same as last week.

THE QUINN.—In about two days the timbering of the new working shaft will be completed to the water level, 110 feet below the surface. This shaft is the old air shaft, enlarged to two compartments. It strikes down immediately upon the vein, whereas the old working shaft was a considerable distance east of the vein. A larger building will be placed over the new shaft than that which was destroyed by fire six years ago.

OCCIDENTAL.—In the upper tunnel on the 48 level the south drift from the north incline winze was extended 10 feet; total length, 168 feet; No. 2 east crosscut from south drift was extended ten feet; total length, 60 feet. West crosscut No. 2 was advanced 10 feet; total length, 37 feet. West crosscut No. 3 started 50 feet south of No. 2, was advanced 13 feet. From the south drift 16 tons of milling ore were extracted.

IOWA.—Face of tunnel B is showing more favorable indications for pay ore. In face of incline shaft sinking on second back ledge to connect with B tunnel is producing some very rich gold rock. A stringer about 12 inches thick has been cut in the bottom of this incline that gives "horn" prospects free gold \$50 per ton. Tunnel A—North and south drifts are producing considerable fine free-milling gold rock.

HALE AND NORCROSS.—On the 1300 level are driving a drift south in the Chollar ground. The drift yesterday lacked 100 feet of connecting with the Chollar incline. This drift is being pushed ahead as rapidly as possible. When the connection is made, they will be enabled to crosscut a great area of new ground, in both the Norcross and Chollar, that is now stripped and ready for exploration.

GOULD AND CURRY.—On the 425 level, at a point opposite the upraise, a southwest drift was advanced 35 feet. This drift shows a mixture of quartz and porphyry. From the west crosscut, 300 level, drifts have been run short distances north and south in the old stopes. Some ore was found in the old stopes and a few tons have been saved.

OPHIR.—On the 1300 level the northeast drift running into Ophir ground from the Con. California and Virginia mine from the Ophir south line was advanced 14 feet; total length, 163 feet. The drift running north from the Consolidated California and Virginia mine was extended 20 feet; total length from the south line, 108 feet.

POTOSI.—On the 250 level good progress is making in the drift south from the Chollar line. A considerable extent of ground has been stripped ready for crosscutting. No ore is now being extracted, all the drifts and other openings in the mine being stowed full of it, there to await milling facilities.

CHOLLAR.—The old Chollar shaft has connected with the head of the old incline, 1000 feet below the surface. The result is a strong upcast through the shaft and a fine circulation of air. The plant of the Sharon shaft, up on the croppings of the lode, will soon be in readiness for ore extraction at that point.

BALTIMORE.—On the 500 level the drift which was filled with a rush of soft, flowing material (last Tuesday when the vein was cut) is being cleaned out. In the vein was found ore giving good assays, and there is a chance for a big deposit, as all for 100 feet above and 400 feet below is solid virgin ground.

CROWN POINT AND BELCHER.—No work is being done in the ore-producing sections of either of these mines. All is awaiting orders from below. Ore sufficient to keep all the mills controlled by the two companies going can be at once extracted when the word to begin the work is given.

BEST AND BELCHER.—On the 1300 level east crosscut No. 2 was extended 65 feet; total length, 144 feet. East crosscut No. 2 was advanced 69 feet; total length, 148 feet. Both of these crosscuts are in porphyry formation. No. 2 is in softer porphyry, and is still showing clay in the face.

ORST.—At this mine, situated a mile west of Silver City, much excellent milling ore is being extracted. The ore is being worked at the Briggs mill. A patent horse-whim is being put up at the mine, and the rich body of ore found on the tunnel level will be followed downward.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running north-easterly was extended 30 feet. The drift is now 380 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 15 feet; total length, 260 feet.

BULLION.—East drift on 200 level out 20 feet. This drift passed through a vein of quartz 60 feet in width when out 240 feet, and is now 120 feet beyond it in vein porphyry. It is expected that another vein will be found lying in front of that which has been cut through.

YELLOW JACKET.—All is going on as usual with plenty of ore in sight. About 150 tons of ore are shipped to the Brunswick mill, Carson river. A considerable amount of work is being done in the old upper levels, where new deposits of ore are being opened up.

SILVER STAR.—The drifts north and south on the 100 level are in vein matter, yielding fair prospects in free gold. The ends of the drifts have been turned somewhat to the eastward, toward the hanging-wall. The ground in that direction seems to improve.

ALTA.—The drift on the 825 level was yesterday in 200 feet. The face was in hard rock. It has 300 feet further to go to connect with the bottom of the winze down from 725 level.

ALPHA AND EXCHEQUER.—The only work now in progress is the sinking of the shaft. This

was yesterday down 50 feet below the 120 level. Nothing is doing in the drifts on the 120 level.

ALLEN.—At the Allen mine near the Devil's Gate, the new lower tunnel has reached the vein, and has found ore that mills \$30 a ton. The new tunnel has drained and opened up a great amount of ore lying above this level.

SCORPION.—On the 500 level the east drift has been advanced 35 feet, and its face is now 147 feet distant from the shaft. The ground through which this drift is now passing is softer than heretofore.

OVERMAN.—The usual amount of ore is being extracted from the level of the Petalun street tunnel. This ore is worked at the Vivian mill.

UTAH.—On the 472 level the north drift from the main west drift was extended 40 feet; total length, 350 feet. The face is still passing through the vein porphyry and quartz.

SIERRA NEVADA.—On the 520 level west crosscut No. 7 was advanced 45 feet. It has been passing through vein matter, but the face is again in porphyry.

ATLANTA.—At this Silver City mine, John Yule, superintendent, a new tunnel is being run. It is driven ahead with two shifts of miners.

VIVIAN.—The Vivian mine, Paul Bennett, superintendent, is extracting and sending to the mills ore that works \$30 a ton.

ANDES.—The usual amount of ore is being extracted on the 200 level and explorations are continued on the 300 level.

Aurora District.

THE CAMP.—Walker Lake Bulletin, March 23: The snow is going away and spring has made part of its appearance. The arrival of Mr. Ann, of the Consolidated Esmeralda Co., is expected now in a few days, and the renewal of work on the mines of that company is also expected. The Silver Lining tunnel is making good progress, and everything about the mine promises well. The ledge continues in size and grade. It is understood that in a few days an upraise from the tunnel will be started. This upraise will connect with the old workings, and permit the extraction of ore at a very slight expense. The Silver Lining and Consolidated Esmeralda will of themselves make times lively, and in the meantime the owners of other claims are preparing for work.

Cambridge District.

NO MILL.—Walker Lake Bulletin, March 23: Cambridge is not dead nor even sleeping. All through the winter it has resembled a large incubator, many plots having been quietly hatched out, to be executed in the spring and summer. Not much work has been done in the mines for the last six months, not on account of a failure of ore, but because there was no mill to crush it. As soon as the foundation, or at least the corner-stone, has been laid for Mr. Spence's new quartz mill, work will be resumed in all the claims which have been profitable heretofore. The owners of the Sherman mine are making preparations to begin work, even if they have to build a small mill themselves. The ore which was taken out a year ago was worth \$40 a ton, and it looks like a lack of enterprise to allow such a mine to lie buried without making any effort for its further development.

Cortez District.

BULLION.—Silver State, March 23: Yesterday Wells, Fargo & Co.'s express had 35 bars of bullion, valued at \$40,000, from Wenban's mine at Cortez. The mine is said to have been purchased by the Sweetwater Mining Company for \$1,200,000.

Galena District.

SALE OF VALUABLE MINING PROPERTY.—Reese River Reville, March 25: B. F. Wilson sold his mines at Galena to R. B. Higbee, of New York, for \$100,000. The sale was completed March 17th, and includes the Humboldt and other mines, the mill property, buildings, etc. The mines comprise a valuable property, the ledge being 50 feet wide, milling two-thirds gold and one-third silver. Mills with a crushing capacity of 60 tons per day will be erected and concentrators added to collect the ore. Work will start immediately. These mines are very valuable and Galena is about to enter upon an era of prosperity. Mr. Higbee has been connected with mining for a number of years in Arizona and New Mexico, and is eminently qualified to make the mines yield a handsome profit. This is splendid news for the people of Lander county, having its mines worked under capable management. A number of wealthy New York parties are also interested in the property. Mr. Higbee will personally superintend the mines.

MINING SALE.—Silver State, March 23: B. F. Wilson, of Galena, returned yesterday from San Francisco, accompanied by Mr. Higby, a prominent mining man. Mr. Wilson has sold his gold mine at Galena to San Francisco men.

Gillie Mountain District.

THE MOUNTAIN VIEW.—Walker Lake Bulletin, March 23: Ed Woods and George Olson have a good property in the Mountain View, a claim in Gillis district. They have a ledge of good average ore, with some high grade. Several tons of rock, that will yield \$100 to the ton, are now out, and in a short time there will be a large shipment ready.

Montezuma District.

FLOURISHING.—Walker Lake Bulletin, March 23: A. A. Nickerson, of Montezuma, went through Hawthorne, last Sunday, on his way to California. He is largely interested in the Montezuma mines, and reports that camp in a flourishing condition. The mines are looking better than for a long time, and a large quantity of ore is ready for shipment. In a short time new reduction works will be built and the cost of shipment will be saved. A large number of mines will be worked as soon as the ore can be reduced in the neighborhood.

Morning View District.

A NEW DISTRICT.—Battle Mountain Nevada, March 20: J. I. Thompson and F. Hutchinson, who have just returned from Morning View mining district, speak very highly of the mines, and are firm in the belief that there is no better prospect for a genuine boom in the country than this camp offers with its big ledges of gold quartz. This district is situated in Humboldt county and is distant from here about 40 miles, near what is known as Jersey district.

Northumberland District.

CHLORIDERS.—Belmont Courier, March 26: The

chloriders of Northumberland district are taking out some good ore which is being shipped to Austin for reduction.

Philadelphia District.

HIGH-GRADE ORE.—Belmont Courier, March 21: James Lait's new find in East Belmont is looking better and better as work progresses. The ore is of a high grade. This find is in a cross ledge not far from the Belmont Company's mine, and proves conclusively that rich ore bodies still exist at or near the surface of Arizona Hill. This ore body, if it opens as it is expected it will, will give new life to mining in Philadelphia district. The mine-owners of Philadelphia district have some of the best properties in Nevada, and we cannot understand why they are allowed to remain idle. A moderate outlay of capital would soon place them on a paying basis if they were properly managed and worked for what they contain. No prospecting to speak of has been done below water level, and those who are best posted say that none of the ledges have given out. Were these mines located on the Comstock they would be giving employment to hundreds of men, and producing thousands on thousands of dollars' worth of silver bullion.

Reville District.

MILL TO START.—Belmont Courier, March 21: It is said that Reville will be a lively camp again this summer. The mill will be started up again as soon as the weather permits.

Sweetwater District.

A SALE.—Esmeralda News, March 26: It is authoritatively stated that Alex. Kilpatrick has succeeded in making a sale of the Sweetwater mill and mines at Clinton. He is on his way there from Chicago, and is said to have everything in readiness to turn over to the new company. We trust the rumor is correct, because it is a well-established fact that capital alone is all that is necessary to make the property exceedingly valuable.

Spurcemeat District.

LIVELY.—White Pine News, March 26: Late arrivals from Spurcemeat inform us that that camp is quite lively, with fair prospects of a big boom the coming summer. It is the general belief over there that a 40-ton furnace will be erected this summer. They have a mountain of low-grade ore there, which is now pretty well tested and can be worked to a profit.

Tybo District.

ENCOURAGING OUTLOOK.—Belmont Courier, March 26: Sheriff W. Brougher speaks very encouragingly of the outlook for live times in Tybo and thinks that that camp will be a steady bullion-producer for many years to come. N. S. Trowbridge is taking ore out of the 26 mine and getting ready to resume sinking. The mill will be in readiness to drop stamps about the first of May. Dimick and Luse's mine is looking well; the main shaft is down 130 feet—in ore all the way—and a level is being run from the bottom to connect with the old workings which will materially facilitate the extracting of ore. They have about 200 tons of good ore on the dump. Mr. Brougher is satisfied that Dimick and Luse have a mine. The Gilmore brothers are working their mine and taking out good ore.

Union District.

KNICKERBOCKER.—Belmont Courier, March 26: County Assessor Charles McGregor says that the Cincinnati Company, operating the Knickerbocker mines and mill in Union district, has everything in good shape for the profitable extraction and reduction of ore. Work is being pushed vigorously in all their mines. To the Storm King some very high-grade ore has been encountered. The mill is in good order and thorough repair, and is being run under the direction of the well-known millman, Thomas Mitchell. All the men that go in there are put to work.

Wild Rose District.

CONCENTRATIONS.—Silver State, March 23: One of the Paradise Valley Co.'s teams arrived yesterday with 16,000 pounds of concentrated ore. Last evening E. Reinhart & Co. shipped 31,000 pounds of concentrated ore to Argo, Colorado.

ARIZONA.

MOHAVE.—Miner, March 26: N. C. Amer brought down a couple of tons of rich ore from the C. O. D. Basin. James Twigg has a ton and a half worked from one of his claims near Chloride. Tom Burch brought up a small lot of rich ore from the Hibernia, Cedar district. H. S. Carpenter had a couple of tons of ore from the Lily of the Valley worked last week. Joe Prisk had a ton and a half of ore from the Keystone dumps through the sampling process. Charley Kelly had 18 tons of ore from the Rainbow mine near Chloride, worked last week, which went better than any previous shipment. Foster S. Dennis informs us that the showing in the Alpha mine is immense, and that he will soon commence shipping. Messrs. Kennedy and Sherman, who are working the Lily of the Valley mine under lease, sent over 12 tons of very high-grade ore. Ore from this mine usually carries over 60 per cent in lead. Tom Burch came up from the Hope mine a few days ago, and states that he has found another bunch of the rich ore for which this mine is famed.

MINERAL HILL.—Florence Enterprise, March 19: Mr. F. H. Maxfield brought down from Mineral Hill this week some very rich, malleable silver ore. He found it in the croppings of a vein lying near Mesquite springs, and has been walking over the ground for years under the impression that the lead was a worthless one. He is making preparations to chloride the vein. If he can get only one ton of ore in two months' work, it would pay handsomely, as it is worth several thousand dollars per ton. We confidently believe that some marvelous mines will yet be discovered in Mineral Hill, for it does not seem possible for nature to have made so many fine fissure veins and distributed so much mineral on the surface without concentrating in some few of the multitudinous ore chutes a vast amount of rich metal. We shall not lose faith in Mineral Hill as a high-grade district till the most thorough development proves the faith unwarranted.

IDAHO.

SHIPMENTS RESUMED.—Wood River Times, March 23: The Queen of the Hills mine, which had not shipped a pound of ore for 60 days owing to the

absence of a satisfactory contract with the smelters, has resumed operations, and is sending out 36 tons per day. This, the Bellevue Herald says, will be kept up for several months to come. The Queen's bonanza seems more extensive than ever. Bully for the Queen!

A CUSTOM MILL.—E. A. White has just completed the plan of a custom mill which he proposes to build this summer, on the bench in Croly gulch, above the Pinney ranch. The mill will have a total elevation of about 80 feet, of which 50 will be on the track floor where the cars will dump the ore on the grizzlies to the under side of the water-wheel which will supply the power. This wheel will have a 45 or 50-foot head, and can drive 40 stamps if desired. But the mill will be so made that any number of stamps, even up to 1000, can be added as long as the proper elevation can be obtained on the bench or foothill.

TRAIL CREEK.—M. S. Quist, one of the owners of the Horse Shoe, says the water in Trail creek is higher than at any time last year. It had flooded their works, and operations in the drift were suspended till the flood subsided. No damage is likely to be done on the Horse Shoe. The water had broken into Levi Smith & Co.'s works, temporarily stopping them. Geo. McCowan reports that the water prevents work on the Myrtle claim. A large amount of gravel has been washed into a large pit and also into the drain race on the Miller claim, and John Hermann's works on the Black Hills are slightly damaged.

CANYON CREEK.—From J. J. Barret, who came in from Canyon by way of Gorge gulch and Granite creek, Saturday evening, we glean the following items. Mr. Barret has just completed a 200-foot contract on one of the tunnels on the Tiger mine; the tunnel was in 100 feet when the additional 200 feet was let. In this 300 feet there is no space 25 feet in length where good pay is not found, neither are any walls encountered, the entire breast at all times being in solid ore. A concentrator will be erected near the mine this spring. Armstrong & Co. have commenced work on the Hidden Treasure and Bengal Tiger fraction. The Tiger vein has been traced and located on the surface 7700 feet. The snow is fast disappearing and in a short time there will be a lively scramble for vacant grounds.

PONY GULCH.—Wm. McCormick came in yesterday from Pony gulch to get two claims recorded near the Fay Templeton, which is beginning to attract attention on account of the high grade of its ore. McCormick states there is quite an excitement there at present on account of the recent developments. There are quite a number of men in the district; he met to go in packing their blankets as he came out. The Fay Templeton, Mammoth, Jim Blaine and Brooklyn are the principal locations at present. Jas. Mullaly has let a contract for 100 feet of tunneling on the extension of the Fay Templeton. These mines are situated on Pony gulch about four miles from Delta. A trail has been shoveled out from the main road to the leads.

SMOKY DISTRICT.—George Montgomery got back yesterday from Smoky. He reports the Smoky mines as "looking finer than silk," and likely to make heavy shipments this summer. The King of the West is showing better with every day's work done upon it. The incline is now down 160 feet below tunnel level, and a sump is being sunk preparatory to crosscutting. At the head of the incline a vein of 14 to 16 inches of first-class ore was shown up on the footwall. In sinking about 60 feet this ore-vein widened to over six feet. At this point the vein straightened, but the incline was continued as originally started. As it got down toward the 100-foot level, seams of galena came in on the hanging-wall side, and at a depth of about 110 feet these seams carry from four to eight inches of solid galena, leaving the main body of ore still on the footwall. In the Tyrannis, Yount, the leaser, is working in about 30 inches of solid ore carrying over 125 ounces of silver per ton. Mr. Dollarhide's mine shows a continuous ore-chute in every opening so far made. They have three or four levels, all showing ore. The owners of the Flagstaff are also taking out good ore, with large bodies of second-class ore in sight. All the other Smoky mines that are worked at all are looking better than ever before.

PLACER NOTES.—Coeur d'Alene Record, March 22: Coban, Vestal and Murphy have six men at work on the Buckskin No. 1 claim. Operations have commenced in Missoula and Dream gulches. Three men began the season's work on the Vestal Consolidated above the Badger in Alder gulch this morning. The water is flowing through the California ditch. The miners of Beaver, Trail and tributary gulches are preparing for active operations in the near future. As the present thaw continues the old claims will all be working in a few days and many new ones started up.

NEW MEXICO.

GOLDEN.—Coeur d'Alene Record, March 21: The San Pedro Company has recently concluded a large sale with Eastern capitalists. They have disposed of the pipe line from the Sandia mountains to the rich placers at San Pedro, and the new company will at once commence and repair the mountain dams, and put the pipe line in order for operations. As is well known, the placers on the San Pedro grant are probably the most extensive and richest in gold of any known in America. The fields have been known for over 40 years, and their actual value has long since been repeatedly and time and again shown up. It has been known that there are several thousand acres of gravel which will pay \$1.25 per cubic yard to work, and that would make fortunes for any company who had the necessary capital to work the same. Mr. Geo. B. Chittenden, general manager, at San Pedro, as an experiment, ran 40 tons through the stamp-mills recently and the run averaged \$1.25 per ton, and as a cubic yard contains 3000 pounds, or 1½ tons, it averaged about \$1.67 per cubic yard. As there are millions of cubic yards that can be washed by hydraulic power, some idea can be formed by the enormous amount of gold these placers contain. The San Pedro Company has recently revoked its present rules and regulations and leases, and issued new ones to prospectors. These latter issues are more liberal, and an effort is evidently made to treat prospectors' rights and interests in a fair way. The company appreciates the importance of having prospectors come on the grant, and knowing as

they do, and as the prospectors do, that the grant will show up in minerals superior to any other mineral region heretofore, they propose, by liberal offers and fair treatment, to get the property developed. The new leases will be here from New York in a few days, and will be distributed among prospectors. Golden is full of miners and prospectors, and the town presents a more animated appearance than for years. We feel that the boom is bound to come, and that Golden and San Pedro will yet be two prosperous and busy mining centers.

SOCORRO.—Bullion, March 26: Richard Mansfield White, owner of the Palomas Chief, brought in a car of high-grade ore to the Graphic smelter last Tuesday for treatment. We give the following return from the Graphic smelter upon the two carloads of ore sent from the Caverio mine in the Magdalena district, by Judge Keeney, on the 21st of March: Lead, 29.20 per cent; silver, 10.80 ounces; gold, 1 penny-weight. J. S. Eddy and W. B. Foster dispatched men to open up their Commercial Union claim in the Socorro or Incarnacion mining district, on Thursday. They will improve their property by sinking a five by seven shaft on their spar vein. The ore very much resembles that afforded by the Merritt mine and assays indicate the mineral from the 24-inch vein to possess from 20 to 60 ounces silver and some gold. It is free-milling ore. Rev. J. M. Robinson returned from Garcia canyon on Saturday last, where he had spent several days, enjoying the sight of his auriferous strike in his extension of the Iron Mask. The property is owned by this gentleman and his associate, Mr. Glasson. It furnishes increasing bodies of gold quartz, galena, sulphate of lead, associated with hematite iron. Mr. Robinson is very much encouraged by the promising condition of his claims and will now devote much more of his attention to their development.

MONTANA.

PLACERS.—Inter-Mountain, March 26: The Libby creek placer mines between Flathead lake and the Kootenai country are likely to have a boom this year. At present there are only about 15 white people and an equal number of Chinese there. One claim produced about \$2000 last summer, the result of one man's work. The gold is fine but heavy, and goes \$19 to the ounce. Hauser & Holter, of Helena, have arranged to buy a half interest in the Curlew mine in Sweetwater district, Bitter Root valley. Blake & Hackett have a bond on the mine for \$10,000, and the Helena men are to take this up for a half interest in the property. It is said that \$15,000 has been offered and refused for the ore on the dump. At Argenta they are just beginning to reap the fruits of poor old man Booth's faith that rich mines existed there. He never found any himself, but those who came after him have. He professed to have an infallible theory by which he could tell where rich mineral existed. The instrument used was a cow's horn partly filled with minerals and what not, which he held in his hands and paraded over the ground, and where the point of the horn happened to turn, there he said the body of ore rested.

OREGON.

AT WORK.—Jacksonville Times, March 20: Some prospectors from Colorado are at work in the southern portion of Josephine county. A 10-dollar nugget was recently picked up in the claim of Birdsey & Mathis in the Foothills creek district. Charles W. Cornelius, one of the owners of the quartz mill which has been crushing ore at the Swinden ledge, has returned from a trip to Portland. The warm weather has had the effect of decreasing the supply of water perceptibly, and some of the miners will soon be compelled to clean up if timely rains do not intervene. Klippel & Bumble have a force of men at work repairing the road to their mill and will soon commence crushing a large amount of quartz from the mines in Jackson Creek district. Reduction works will be put up at East Portland at once and will be ready for business about the first of May. The delay was occasioned by the difficulty of securing ores in the winter. We are glad to see Portland capitalists awakening to the necessities of the hour at last.

ALL AT WORK.—Oregon Sentinel, March 19: Henry Ankeny, of Sterling, came to town last Tuesday. He reports the Sterling miners all at work, and an abundance of water. In the Ankeny mines two giants are at work day and night and are removing an immense amount of gravel. They expect a late run, as there is more snow in the mountains than there has been for years.

UTAH.

PARK NOTES.—Record, March 26: We are informed that the Anchor Mining Co.'s management has in contemplation the driving of a deep tunnel from the south through the White Pine divide, and thus relieve by drainage the large amount of water that now impedes progress of development. At the same time this tunnel would fully prospect a large area of country, the surface indications of which give great encouragement. It, however, seems to us that a more feasible plan would be to follow the scheme that Col. O. J. Hollister attempted to inaugurate here years ago—that of incorporating a large tunnel stock company composed of the Ontario, Daly, Anchor, Sampson, Boss, Crescent, and all other companies on the great mineral belt, for the purpose of running a deep drain and prospecting tunnel from the east, starting in the vicinity of the mouth of McHenry canyon, to the east of the Ontario. It is not unsafe to predict that this scheme will yet be adopted, and at an early day too. The Putnam group is south of the Daly, and enough work has been done on the property to demonstrate its richness and entitle it to Government patent. It is understood that active development work will soon be renewed on the tunnel. Surface water is causing a little trouble in the upper workings of the Crescent. Owing to the bad condition of the roads and the fact of improvements going on at the Mackintosh sampler, the shipments of Ontario and Daly ore have been cut off the past 10 days. Roscamp & Glenn are preparing to work their claims at the head of Tbayne's canyon on a larger scale than ever this year. Thursday, two Kentuck gold bars from Idaho were remelted and re-assayed at the Marsac mill. The result was one bar containing 87½ fine gold ounces, and it was shipped to San Francisco yesterday morning.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belt, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Mining Share Market.

The prices of stocks still continue low. The situation on the Comstock has developed no features of late to start prices upward. Nevertheless, the Virginia Enterprise says: W. S. Hobart, who left here last evening for San Francisco, carefully examined all the levels of the middle mines and expressed himself greatly pleased with what he saw. He will return to the Comstock in about ten days to remain among us all summer. Before that time an upward movement, or the beginning of it, is likely to be seen. About that time the work of putting up reduction works here on the lode will be commenced with a rush.

The yield of \$48,000 from 2000 tons of ore, crushed this month, is good evidence that the Consolidated California and Virginia is not the only producing mine at this end of the lode. Had they mills in which to reduce their ores, they could keep up the same showing right along.

Outside of this city and Gold Hill, several mines to the southward, about Silver City, are coming to the front as regular ore-producers. A few of these are mentioned below. In addition, we may mention that Piper's mine is yielding ore that mills \$25 to \$30 a ton; Herman J. Scheel is getting out good ore, and Geo. W. Cooke has struck good pay in ground adjoining the Allen mine, while quite a number of men have small veins, worked as individual claims, that pay them more than miners' wages.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department 10, San Francisco:

UNION FENCE CO. March 20. Object, to manufacture fences. Capital stock, \$100,000. Directors—Edward Clark, George Cottrell, J. D. Sullivan, M. Livingston and Thomas E. Cooney.

NAVAJO G. & S. M. CO., NEV. March 28. Capital stock, \$5,000,000. Directors—Irvin C. Stump, W. E. Norwood, E. M. Raitton, Geo. R. Sanderson and James Adams.

BANNER M. CO. March 28. Location, Nev. Capital stock, \$1,000,000. Directors—John T. Davis, S. M. Holmes, A. Snider, E. M. Raitton and John M. Pierson.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, March 29, \$41,502; total to date for March, \$165,450; Eureka Consolidated, 28, \$18,000; Candalaria Co., 25, \$11,000; Alice, 24, \$27,000; Bluebird, 23, \$27,000; Hanauer, 24, \$50,75; Bannock, 24, \$1600; Queen of the Hills, 25, \$6220; Hanauer, 25, \$2850; Alice, 21, \$16,213; Moulton, 21, \$16,000; Richmond Con., 23, \$18,672; Savage, 24, \$20,000; total for March to date, \$48,000; Hanauer, 27, \$5330. Last week Wells, Fargo & Co. shipped from Salt Lake \$65,857; McCormick & Co., \$63,255; T. R. Jones & Co., \$16,383; Union Bank, \$13,213.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

THE Potosi Mining Co., whose mine is on the Comstock, has elected the following officers: A. K. P. Harmon, president; W. E. Sell, vice-president; C. T. Badge, A. W. Rose, Jr., and Joseph Marks, directors; C. E. Elliot, secretary.

THE Hale and Norcross Mining Co. has elected the following officers: M. H. Levy, president; Jos. N. Souther, vice-president; W. E. Sell, C. T. Badge, A. C. Hamilton, W. C. Watson and M. Hoeftich, directors; J. F. Lightner, secretary.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California, and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay of Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1834. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Fluxes; Process of Amalgamation; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages, with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 252 Market St., S. F.

Liberal Religious Literature.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

ASSESSMENT NOTICE.

Gover Improvement Company.—Location of principal place of business, San Francisco, California. Location of works, Amador county, California. NOTICE is hereby given, that at a meeting of the Board of Directors, held on 25th day of February, 1887, an assessment (No. 2) of ten dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 313 Pine street, room 9, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1887, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 26th day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, R. N. VAN BRUNT, Secretary. OFFICE—313 Pine St., San Francisco, Cal.

TO EVERY PUMP MAKER!

Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION or ANY ADJUSTMENT of ANY KIND of a PUMP which is not answered in Mr. ROBERT GRIMSHAW'S PUMP CATECHISM, we would like to have it for answer in the next edition or volume.

The Author will answer any such question in his columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

"Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

DEWEY & CO.

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used. Weight Guaranteed.

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of **JOHN TAYLOR & CO.,** Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

NOTICE.—My Silver-Plated Plates are well known, and in use everywhere. They still continue to assay at least one-quarter more silver for the same money than any plates made here. One trial of my plates in competition will prove this. Light, thin silver-plating looks the same as heavy, but has no durability.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & CO., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F.

RURAL HEALTH RETREAT,
ST. HELENA, CAL.

This delightful Resort has been fitted up as a Sanatorium, and offers unrivaled advantages to Tourists and all Classes of Invalids, both for winter and summer. It is situated on the southwestern slope of Howell Mountain, a locality of enviable reputation for health-recuperating qualities, about 1200 feet above tide level, 500 feet above and overlooking the beautiful Napa Valley, and 2½ miles from St. Helena.

Its Natural Advantages

Are equal to those of any other health resort. It is noted for its Pure Water, Dry Atmosphere, Clear and Balm Sunshine, Even Temperature, Mild Breezes, and the absence of high winds.

Our Remedial Measures

Include All Forms of Baths, Vacuum Treatment, both local and general; Galvanic and Faradic Electricity, Mechanical Appliances, and Exercises for the Development of the Lungs, Vital Organs, and Muscular System, and Cure of Deformities.

The Rational Treatment

By known remedial agents is employed. With these natural and acquired advantages, pleasant and desirable surroundings, thorough and judicious treatment and wholesome diet, most invalids who avail themselves of these agreeable facilities, rapidly recover.

The Retreat is under a thoroughly competent director, and patients have the care of two regularly graduated physicians of experience, who are assisted by well-trained and courteous gentleman and lady assistants. All Invalids and Tourists may feel assured that they will be courteously received and kindly cared for. For Circulars and further particulars, address

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and con-
struction of Ditches, Flumes, Dams, Pipes, Flow of Water
on Heavy Grades, methods of mining shallow and deep
placers, history and development of mines, records of
gold washing, mechanical appliances, such as nozzles,
burdy-gurdy, rockers, undercurrents, etc.; also describes
methods of blasting, tunnels and sluices; tailings and
dump; duty of miners' inch, etc. A very practical work
for gold miners and users of water. Price, \$5, post-paid.
For sale by Dewey & Co., Publishers, 232 Market St., San
Francisco.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold
in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co.
(Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting
that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works,
Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded
to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.
The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quanti-
ties to suit purchasers.

THE HAZELTON BOILER.

A NEW DEPARTURE AND RADICAL CHANGE IN FORM OF STEAM GENERATOR.

The Most Notable Improvement ever made in this Department of Engineering, affording a degree of Safety, Durability and Economy never before attained. Over 100 now in use, aggregating upwards of 13,000-Horse Power.

THE NEW YORK MUTUAL GAS LIGHT COMPANY has been running a 275-horse power Hazelton day and night for the past six years. Also five more, aggregating upwards of 1000-horse power, all carrying 125 degrees pressure. The Superintendent says: "Not a new tube has been put into any of them, nor have they required any repairs whatever. They do not scale, are easily managed, perfectly safe, and I consider them the best Boilers extant."

THE HUDSON GAS LIGHT COMPANY, of Hohen, N. J., has used two 30-horse power for two years, running day and night, and the Superintendent says: "They have required no repairs and are in as good condition as the day they were completed. Are quick steamers and economical in fuel. The lowest grade of fuel produces and maintains for us not less than 100 pounds steam pressure, at which we always work."

MESSRS. ALDEN, SAMPSON & CO., OF NEW YORK, say: "The 200 and 350-horse power Hazelton Boilers which we have at our Works at New town, N. J., as well as the 40-horse power in use at our factory at Hallowell, Maine, are giving good satisfaction. We consider them very economical in fuel, easily kept clean, rapid producers of an abundance of dry steam, and perfectly safe."

THE JERSEY CITY STEEL COMPANY, of Jersey City, N. J., are using two 100-horse power, utilizing the waste heat from flue boilers. The Manager says: "Each Boiler gives us from this waste product nearly 100-horse power, after passing through a 30-foot Flue Boiler. They require no repair, we experience no trouble in keeping them clean, and they are every way satisfactory. The quantity of fuel to produce a given result is decidedly less than any Boiler we have ever used."

The Superintendent of the LA LUZ MILLING CO., OF GUANAJUATO, MEXICO, after using a 70-horse power for a year, says: "I have run it with the worst water I have ever seen put into a Boiler without experiencing any trouble whatever. In the matter of economy, nothing can equal it. The 70-horse power Hazelton used only half as much wood as the 25-horse power Tubular Boiler which it replaced, developing twice the power. I see nothing to indicate that it will not be the most durable, as I believe it to be the safest and most economical Boiler now in use. I have had nearly 20 years' experience with all kinds of Boilers, and give the Hazelton preference against all competitors. In fact I told my company that we could not afford to run the ordinary tubular or any other kind of Boiler if they were put up in our Mill free of cost. I have ordered three more of 75-horse power for the new Mill of this Company, now being erected."

HENRY DISSTON & SONS, OF PHILADELPHIA, the well-known saw manufacturers, after running a 60-horse power Hazelton fourteen months, ordered seven more for their works in Tacony, Pa. The General Manager says: "The 60-horse power Boiler bought fourteen months ago has developed an average of 85-horse power, and it has not scaled or given us a particle of trouble. We consider them the best Boiler made."

THE WEYMOUTH PAPER MILLS OF NEW JERSEY, after running a 100-horse power about a year, say it gives perfect satisfaction, and they consider it the best Boiler made. Steam dry; also works much beyond its rated capacity.

Reference is also made on this Coast to the California Cotton Mills at East Oakland, running a 150-horse power. Also to the Black Point Pumping Station of the Spring Valley Water Works, San Francisco, running a 200-horse power, and the Southern Pacific R. R. Co. running a 75 H. P.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.
Publishers.

SAN FRANCISCO, SATURDAY, APRIL 9, 1887.

VOLUME LIV
Number 16: 1

The Granite Mountain.

A Famous Montana Gold Property.

We give in this issue of the PRESS a sketch of the workings of the celebrated Granite Mountain gold mine. The mine is located in Deer Lodge county, Montana. It is some 50 miles west of Butte and about midway between Anaconda, on the Utah Northern branch of the Union Pacific system, and Drummond, on the main line of the Northern Pacific R. R., which is by far the pleasantest route to take to get there except in the midsummer season, on ac-

count of their ore body. Of that there is but little fear, as their lower levels have continually developed richer and more extensive ore chutes than were obtained nearer the surface.

Conservative estimates on the ore bodies now in sight have placed the value at many millions. Consequently they will have no difficulty in keeping their works constantly running with the present brilliant results for years to come.

They are placing on the Ruby shaft at No. 3 level a hoist and pumping apparatus capable of carrying the work to a depth of 3000 feet.

years' experience in superintending properties of this kind make it almost needless to say that he is the right man in the right place. By referring to his annual report we see that not the smallest item escapes the watchful eye of the superintendent. Details are complete of everything. The amount of supplies, wear and tear, labor, and in fact everything, is taken up in its regular turn and averaged up so that an extra expense in any one item will be immediately noticed and looked into by the proper authorities.

In the engraving, Nos. 1, 2, 3, and so on, in-

Company as an adjunct, has been sufficient to induce railroad capital to connect them with the main line.

The Bimetallic Company is an incorporated company. Some of the Granite stockholders are also interested here, and they are energetically developing the western extension of the Granite lead under the name of the Jas. G. Blaine. They have been so well satisfied with developments thus far that they have purchased a 20-stamp mill that was erected on the Algonquin mine some years ago and failed to pay. This plant was a very complete one at

SKETCH SHOWING WORKINGS OF THE GRANITE MOUNTAIN MINE, MONTANA.

count of having the high Cahle divide to cross between Anaconda and Phillipshurgh. At present, stage lines run daily from each point to Phillipshurgh and accommodate the travel to this prosperous mining camp. Our correspondent, R. G. Huston, who visited the mine not long since, gives us some further facts concerning the property, as follows:

The output of this mine since April, 1885, has been simply wonderful—the dividends to Jan. 1, 1887, running very close to \$100,000 per month, notwithstanding the large amount of development work going on and the large and expensive plant being placed thereon. They started first with 20 stamps; six months afterward they added 10 more stamps, and now have an additional 40 stamps running. All the improvements have been promptly paid for from the output of the mine, and dividends are being paid regularly.

With the increased capacity of their works, the company will be enabled to work a large amount of lower-grade ore that they have heretofore left untouched, and thus keeping up their output to the present amount, and still

When this is fully completed, there will apparently be nothing further for the Granite mine to do but continue work and declare dividends on their 400,000 shares of from 25 cents to 50 cents per month. The present value of their stock is about \$65 per share.

The company carries large stores of supplies shipped in during the summer season, and blockades on the railroads in winter have no effect on the equanimity of the managers. It is a wise idea, as was proven by the conduct of the mines and mills at Butte during the winter. Heavy storms of weeks' duration are likely to occur any winter in Montana and should be provided for in the fine summer weather.

The low prices of silver resulted in a loss of nearly \$100,000 during the past year to the Granite Mountain Co. This loss, of course, fell on all silver-producers alike, and while it does not prevent this company from continuing their large dividends, it is equally undesirable.

Capt. John W. Plummer is still the leading spirit at the Granite mine, and under his skillful guidance there is no question about the prosperity of the company. His many

dictate the tunnels, and the different stops are lettered. In the various stops the ground has been systematically hocked out with a view to economize production. The company milled last year 8428 tons gross weight. This yielded 1,384,216 ounces of silver and 380 ounces gold. They saved in milling 95 per cent of assay. The average cost of milling, including labor, supplies, etc., was \$13.71 per ton.

The company employ directly between 200 and 300 men, and probably as many more gain their daily bread from the same source indirectly. A town with a population of nearly 1500 people has grown up on the mountain-side below the mine in which all the different lines of business incident to supplying that number of people with their daily needs are represented.

It is four miles down the mountain west of Granite to the old town of Phillipshurgh. This place, one of the oldest quartz-mining camps in Montana, will this summer be connected with the outside world by railroad by a branch from the Northern Pacific from Drummond. The record of the Granite mine for the past two years, with the old Hope Mine and Milling

the time it was placed here, but owing to the advancements made in milling silver ores will require a complete refitting, which they will have done by May 1st. They will only have one and a half miles to transport their ores to this mill, making it about as convenient as if they had built it to order. In a short time no doubt we shall hear of favorable results from the Bimetallic. J. B. Risque is the superintendent of these works.

The West Granite is also an incorporated company, with an immense capital stock. The owners are energetically at work developing a mine on their property which lies south of the Bimetallic Works. Many reports of strikes of ore have been circulated concerning the West Granite, and the truth of them could not be ascertained. "This much," says Mr. Huston, "I do know, that they are showing a large amount of energy in prosecuting their prospecting, and are deserving of a good strike whether they get it or not. J. K. Pardee is the general manager of this enterprise, and most of the stock is held by residents of Helena and St. Louis."

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Working Flat Gravel Ground.

A Machine for Removing Rock from Ground-Sluices—Process of Working at Alder Gulch, Montana.

EDITORS PRESS:—Alder Gulch, which has given many millions to the world since its discovery in 1863, still retains enough of the "pracious" to reward intelligent labor for many years to come. The bulk of this was mined the first two seasons after discovery, the primitive methods made necessary by the then small holdings leaving a considerable percentage of gold behind in the old workings. Later these small holdings passed into the hands of a few companies and individuals, and reworking by bedrock flumes and other appliances was commenced.

The lower half of the 15 miles of gulch has but little fall, and for this reason, and because this division is in half a dozen separate holdings, none but the finest portion of the gravel can be allowed to pass off through the bedrock flumes, which are necessarily of very light grade.

With the intention of consolidating this flat portion of the gulch and bringing water from the large streams on either side, companies were formed some years ago; but the engineering difficulties were found to be so great as to not warrant the outlay necessary for such an enterprise. Such being the situation, the different companies were compelled to each take the water of the gulch at their upper line at the creek level, and deliver it below in the same manner. The use of water under great pressure was not possible for this reason, and because the banks on either side were low.

The Mode of Working

Finally adopted required a long, flat ground-sluice, in which men, stationed at intervals, forked and wheeled away the rock, allowing only the finer gravel to pass off through a bedrock flume.

Being the possessor of a portion of this flat ground, I have been for a number of years experimenting with and perfecting machinery to do the work of removing rock from my ground-sluice, with the result of a machine, which, operated by a boy of 14 years, will do the work of half a dozen men with forks and wheelbarrows, and so effectively that a bedrock flume, with a grade of 1 inch to 12 feet, carries the tailings with ease which pass the machine.

Process for Working Flat Ground.

Owners of flat gravel mines may be interested by a description of my process of mining before the conditions of my ground would admit of a bedrock flume of even small grade. Commencing at my lower line, where there was an outcrop for only fine tailings at the creek level, some manner of mining was necessary in order to be profitable, whereby the water of the gulch could be made to hoist and wash the gravel at the surface until a point was reached above, where a flume of small grade would touch bedrock and have its dump near my lower line. For this purpose I constructed a machine, similar to the one now used for removing rock from the ground sluice, with the addition of an incline track and self-dumping cars to carry the gravel from bedrock to the machine. Using this machine, a pit 100 feet up the gulch, the width of the pay streak and to the bedrock (17 feet deep), was shoveled into cars, hoisted to the machine and washed, and the rock piled out of the way, the fine gravel passing off through a short string of sluices, possessing the same advantages for saving gold as undercurrents.

After clearing a pit as described, it served for impounding the tailings, which were ground sluiced nearly half-way to bedrock, from the top of a pit of equal area above. While filling the pit, the water from the ground-sluice passed off below through a box tail-race, with only half sufficient to carry clear water, and which also served as a drain. This box tail-race was made strong enough to resist the pressure of the overlying wet gravel, which was considerable while ground sluicing. It was laid to the head of each pit before filling, and the water let into it by a shaft, or monument, which was built up as filling progressed, so as to keep the sand and gravel from entering the tail-race. After stripping in this manner, the machine was moved up on the filled ground, and the remainder of the gravel shoveled into cars and hoisted as before, when the process of filling by ground-sluicing the surface from another pit was repeated.

A 12-foot overshot water-wheel, driven by 80 miners' inches of water, gave the power to hoist the gravel from bedrock, and to carry the washed rock from the machine back on the worked ground; the same water which furnished power for hoisting being turned on to the sluices between each carload to wash the gravel. Working by this method for several years, five men (one to tend machine and four to shovel) removed and washed 12,144 cubic yards of gravel each mining season, 135 days being the average season.

The Improved "Rock Separator."

Reaching a point on my ground where a flume was practical, my rock separator was brought into use. This machine is placed near the

ground to be mined, and at the head of a 30-inch bedrock flume having a grade of 1 inch to 12 feet. A movable flume, which can be curved to accommodate the ground-sluices above, and given sufficient grade, carries the heavy gravel to the machine, where the rock is separated and dumped automatically on either side of the main flume, forming a continuous pile as the works are moved up. My plan of working is to keep the ground-sluices V-shaped, with the point down toward the machine. While ground-sluicing is progressing on one side of the V, bedrock can be cleaned on the other. After ground-sluicing and cleaning bedrock on one side of the V, a low wall is built against the unworked ground, and the top from a diamond-shaped pit, extending from the central line of the gulch to one side, is stripped in the same manner as before described when the sluicing was done at the surface, the continuous pile of rock at the sides of the main flume restraining the tailings but allowing this water to pass off comparatively clear. This leaves a little over half of the bank to be ground-sluiced and separated by machine.

There is, without doubt, throughout the Pacific States and Territories, a large amount of ground which might be profitably mined by the use of one of these machines.

This machine for washing at the surface would be useful for river mining, being portable and easily gotten out of the way of a freshet; and on all flat mines where ditches are not already at hand to give sufficient head for an elevator, this machine could be made to suit the conditions, and used with economy. Every miner knows that

Long Bridges are Expensive

To construct and keep in repair; and then there is great loss of power in the use of the hydraulic elevator.

If I am correctly informed, it requires as many inches of water to do the lifting in an elevator as there is in the ground-sluice; and the best result obtained, the raising of gravel and sluice water one-fifth of the height of the head used in the elevator. During the past season, using a rock separator, which was built for trial, and was consequently very imperfect, it took from the ground-sluice all the rock which would not pass through a screen with one and one-quarter inch perforations, by the power given by a 12 foot overshot water-wheel, driven by one-seventh of the water used in the ground-sluice. All the fall required was given by the drop from the surface of the gulch to bedrock, and as a rule, the fall from surface to bedrock will give sufficient power with the given ratio of wheel-water to ground-sluice. Where mines are so situated as to give sufficient fall, the water-wheel can be set above the surface and power transmitted to the separator by wire rope belting, and the water again used in the ground-sluice.

A Suggestion to California Gravel Miners.

It is probable that a form of rock separator, suited to the conditions of the enjoined hydraulic mines in California, might be used so as to allow their being worked without injury to the agricultural lands below. The flume inside of worked ground might be heavily timbered and planked over, so as to make a sort of tunnel; then, by a separator at the head of the flume, rock taken from the ground-sluice might be dumped in such a manner as to form a restraining dam across the channel, back of which the top dirt from above might be dumped, and afterward the bottom gravel washed through a separator. It is probable that many of these hydraulic mines are so situated that the small amount of tailings which would pass a separator could be carried by a flume of light grade to a convenient place of impounding; or, by the use of a settler and a very small elevator, dumped above the filling from the top dirt, leaving the bulk of the water after passing the settler comparatively clear. In mines where there is cement carrying gold, the separator might be used at the dump of the flume, and the tailings carried to a place of impounding, as suggested before. Machines for separating the rock from the finer gravel, and used in such a way as to form restraining dams, will, in my opinion, be important factors in the working of these mines in the future. There are no difficulties, in the way of working without danger to agricultural lands, which engineers and inventors cannot overcome.

If Tailings Were Impounded

Outside of the channels of streams subject to freshets, and the water, after passing the restraining dam, was carried a short distance in a ditch, with little grade, so there could be no possible grounds for the assertion that "slickens" had escaped, it would seem as though there could be no legal obstacle in the way of working these mines without an Act by the Legislature. Without doubt the hydraulic miners of the enjoined districts feel sore from the defeat of the Walrath bill, but the fearful responsibilities required of the miners by that Act would, had it become a law, only have paved the way to litigation more disastrous to the miners than that which has passed. In the present over-sensitive state of the farmers, the defeat of the impounding bill has cheated the lawyers out of another rich harvest.

L. A. FENNER.

Virginia City, Montana, March 22, 1887.

The recent discovery of gold in paying quantities in Arkansas has caused much excitement, and the country is being flooded with prospectors and miners.

North Star Quartz-Mill.

A Splendid Establishment With All the Latest Improvements.

The new quartz mill of the North Star Mining Company, of Grass Valley, says the *Union*, has now been running about 10 days, and as it has been pronounced the finest gold quartz-mill in the State, and as some experienced mining men declare that it is the best mill of which they have any knowledge for its capacity, some items concerning it will not be uninteresting. The North Star Mining Company let the contract for building the mill to the Risdon Iron Works, of San Francisco, in September of last season; on the 28th of that month the contract for building and setting up the machinery was sub-let to W. C. D. Body, of Grass Valley, whose plans for the mill had been adopted by the company. Contracts were immediately made for the lumber to the amount of 300,000 feet, with Towle Bros. at Alta, and Geo. W. Whiteside, of the Eureka Lumber Company, and the mason work connected with the structure commenced. Within less than a week a considerable quantity of lumber was on the ground, and a large force of carpenters and other workmen busily employed. The weather continuing favorable, the large works were under cover before the winter rains came to interfere with operations, and the building was ready in advance of the machinery with which it was to be occupied. The mill is situated on the west side of the hoisting works and below the county road, and is attached to the hoisting works by a truss bridge which is nine feet wide and 60 feet in length, over which a car-track is laid with T rails, the full length of car-track being 100 feet. By means of this track the cars are run from the landing of the hoisting works into the top of the mill building where the ore is dumped upon inclined gratings (grizzlies) and descends into the ore-bins—the finer quartz passing through the gratings and the coarser going down to the rock-breakers, through which it passes into the bins underneath, from whence all the ore continues on down to the self-feeders which supply the batteries. The ore-bins are capable of holding 2500 tons of quartz, and are framed of heavy timbers, 14 by 14 inches, set on the bottom at an angle of 45 degrees. Below the bins is the battery floor, the dimensions of which are 40 by 75 feet, with room for eight batteries of five stamps each, but for the present, 30 stamps have been put up. The battery frame is of sugar pine. Below the batteries on the inclined floor are set sluices lined with silver plates. Below the battery floor is the concentrator floor, which is 40 by 86 feet, and on which sets 12 Triumph concentrators (two for each battery) which receive the pulp from the sluices above.

Adjoining this battery floor on the north is the cleanup-room, 20x22 feet, in which is laid a cement floor, and which contains all the conveniences for handling the amalgam and bullion. On the same level with the concentrator floor, on the north, is the compressor-room, 22x40 feet, and adjoining this on the west the wheel-room (in which are set three Pelton wheels), 16x22 feet. On the south of the concentrator floor is the snlpburet-room, 28x30 feet, with cement floor, sides and roof with glass sash. The whole interior of the mill is arranged in the most convenient manner, and all parts of the workmanship are very substantial. The list of machinery within the mill is 30 850-pound stamps, 2 rock-breakers, 6 shaking tables, 12 concentrators, 2 pans, 1 cleanup-barrel, 1 battea and about 600 feet of silver plate; of driving machinery, 1 air compressor and 4 Pelton wheels—one of 6 feet for battery, one of 6 feet for compressor, one of 4 feet for rock-breakers and one of 3 feet for concentrators—all run with cotton ropes of 1½ and 2 inches. The Pelton wheels take up but a small space, and a person not familiar with their capacity would be surprised at seeing so large a quantity of machinery driven by these little wheels. In the hoisting works, heretofore driven by steam-power, two Pelton wheels have also been introduced—one of 6 feet to do the pumping and one of 5 feet for hoisting. The Pelton wheels were all manufactured at the foundry of Geo. G. Allen, of Nevada City, while the mortars and stamps and other iron-work were from the Risdon Iron Works, San Francisco. By the arrangement of the mill the distance from where the ore is dumped from the cars until it is discharged as pulp from the concentrators is about 90 feet. The crushing of the ore is done automatically, and is not handled after being dumped except at the rock-breakers, which are attended by two men at daytime only. By this means seven men are sufficient to run the mill in 24 hours, during which time the mill is expected to crush 75 tons of ore, the cost of the reduction of which should not exceed 50 cents per ton, and possibly may not reach that.

As stated above, this is considered the best gold-saving mill in the State, being strong and well finished in its construction and admirable in its arrangement for convenience in handling the ores, and doing all the other work, and is every way creditable to the enterprise of the company in providing so excellent a plant, and to Mr. Body, the designer and builder, whose work has been highly complimented by all who have viewed and examined the mill. The cost of the mill has been about \$50,000.

The United Nickel Company of New York has secured the C. P. R. R. for using its patent process of nickel-plating metals.

The Potter Process.

Working Dry or "Refractory" Ores.

A new smelting process invented by James A. Potter, of Chicago, is talked of as being tried in Idaho. Chas. E. Baldwin, of Minneapolis, and W. D. Pinkston, of Shoshone, Idaho, have bonded the patent, they to organize a company and put up a plant. The details of the process as given in the *St. Paul Globe* are as follows:

The Potter process can be applied to any smelting furnace. On either side of the base of the furnace are two tanks or reservoirs, which contain molten lead. The furnace stack is tapped just above these tanks and the mixture of precious and base metals floats over the lead. As the lead unites with the precious metals below, a shower-bath of molten lead is thrown from above, making the union more perfect. This molten alloy of lead and precious metals is used for the shower-bath over and over again, by means of force-pumps; while the base metals are floated off. When the lead has taken up all the gold it will contain, it is very rich indeed, a ton being worth \$10,000 to \$12,000. This is the advantage of the process. No matter what the condition of the ores, whether rich or low grade, dry or refractory, the operation is the same, and the same result is reached. And instead of shipping away (as at present) an alloy worth \$150 a ton, the base bullion is worth \$10,000.

The value of the Potter process, says the *Globe*, is two-fold: First, in saving the expense of freight on base bullion and in getting lead; second, the large saving in getting the additional percentage of the precious metal locked up in the ores. If, for instance, ore should assay \$100 to the ton, not more than 70 per cent is saved in smelting by the old process; while for the Potter process is claimed a saving of at least 95 per cent.

Commenting on this statement, the editor of the *Wood River Times* says: The *Globe* was misinformed as to the percentage of loss in the present process of smelting. Ore-purchasers for smelting purposes buy on the basis of 90 per cent of the lead and 95 per cent of the silver contained in the ores. That is to say, if ore carries, say, 100 pounds of lead and 100 ounces of silver per ton, the seller gets paid for 90 pounds of lead and 95 ounces of silver, less the freight and smelting charges.

The *Globe* states that "one of the officials of the Potter Company is prospecting through Montana to select a site for the location of a plant." That is entirely unnecessary. If the process does what is claimed for it, the Wood River, Salt Lake, Reno, Portland, or Denver smelters will doubtless be glad to adopt it; and the *Times* advises the company to quit "prospecting" for locations and come here at once. There are four smelting furnaces at Ketchum, one at Hailey, and one at Bellevue, the owners of all of which will doubtless be glad to assist the company in introducing its process, if they can be assured that it is of any account.

The Plymouth Consolidated Mine.

The Plymouth Consolidated Gold Mining Company has issued its fourth annual report, from which we take the following figures:

This company was formed June 1, 1883, by the consolidation of the Empire, the Amador Pacific and the Plymouth companies. The mines were well developed, and a considerable amount in dividends had been paid. Prior to the consolidation, gold bullion to the amount of about \$2,500,000 had been produced.

The following is a statement of all the receipts and expenditures of this company from its organization, June 1, 1883, to January 1, 1887, a period of three years and seven months.

June 1, 1883.—Cash on hand at time of organization of company.....	\$ 153,319 80
Gold bullion produced by the mines.....	3,068,194 69
Disbursements:	
Operating expenses.....	1,144,699 82
Construction since June 1, 1883.....	170,764 78
Thirty-one dividends.....	1,825,000 00
Cash on hand January 1, 1887.....	81,079 89

During the year both mills have been run with regularity, crushing in the aggregate 101,315 tons of ore. The average yield of gold was \$6.18 per ton.

In accordance with the policy announced at the beginning of the year, most of the rock used was of low grade and taken from the upper levels; the better class of ore, and which composes the deep levels, being reserved for future use. The Empire mill has been supplied with rock from above the 900-foot level. Nearly all the rock crushed by the Pacific mill came from between the 900 and 1300-foot levels.

The cost of production was as follows:

	Per ton.
Mining.....	\$2 18
Milling.....	39
Saving and reducing sulphurets.....	37
General expenses—office, taxes and prospecting.....	11
Total average cost, including all expenses.....	\$2 50

This mine is fully developed with large reserves and is now paying larger dividends than any other gold mine in North America. The mines are said, officially, to be looking better than at any previous period of their history, and the company has the largest quartz mill in the world, with a single exception. The stock is selling at about \$1,650,000.

Railroad Rates.

Freights and Fares Under the New Law.

Pacific Coast producers and shippers have been on the anxious seat ever since the enactment of the Interstate Commerce law as to what the immediate effect would be on rates to and from this coast. The *Morning Call* of March 30th gives the following full information on the subject:

The new western classification by which freight rates are to be permanently regulated after April 4th next came to hand yesterday, and railroad agents are at last in a position to give reliable information in regard to tariffs as they will be under the Interstate Commerce bill. The tariff schedule received last week was simply the first rough division of the various kinds of freights into some ten classes, running from one to five and from A to E, stating also the rates which were to be charged for each class. The new sheet, however, deals directly with the freights themselves without regard to their prices, and, with the old sheet as a basis, completely reclassifies them under the heads from one to five and from A to E. When a merchant, for instance, desires to know at what figure he can import hams and hocks from Missouri-river points, he simply turns to the schedule, and under the appropriate head finds them rated in the second class for lots less than a carload, and in carload lots and over in the fifth class, the rate in the first instance being \$2.50 and in the second \$1.50. This classification, however, only applies to those classes of freight for which no special rates have been made. In the transportation of beans, canned fruits, etc., for which freight the Pacific Mail competes strongly, special rates have been agreed upon as follows:

ARTICLES In carloads of 20,000 lbs., per 100 lbs.	To		
	Missouri River and Common Points.	St. Louis and Common Points.	Chicago and Common Points.
Beans, canned fruits, pickled fish, canned salmon, honey (strained).....	1 40	1 50	1 55
Borax, cocoon oil, whale and fish oil, vegeta- bles.....	1 10	1 20	1 25
Barley.....	05	72	75

Hops, any quantity, from the Pacific terminals named above, to Missouri-river common points, \$1.75 per 100 lbs.; to St. Louis and common points, \$1.85 per 100 lbs.; and to Chicago and common points, \$1.95 per 100 lbs.

Oranges, in car-lots, from Los Angeles, Cal., to Missouri-river points, \$1 per 100 lbs.; to Sioux City, Iowa, and St. Louis, Mo., and common points therewith, \$1.10 per 100 lbs.; and to St. Paul, Minneapolis and Chicago, \$1.15 per 100 lbs.

This last rate differs but slightly from that made under the old regime. The old rate to Chicago was \$1.05, so that there is only here an increase of 10 cents. To Denver the rate is lower by some 40 cents, the rate having previously been \$1.40, where it is now \$1.

San Francisco merchants have awaited with much interest and anxiety the issuance of the new local rate-schedule upon which the officials of the Southern Pacific have been working most assiduously since the return of J. C. Stubbs and Richard Gray from Chicago. It will be a decided relief for them to learn, therefore, that the interstate-law does not alter, save in a few unimportant particulars, the present relationship between the Missouri river and California in respect to Salt Lake City and Ogden.

In reference to the maintenance of the existing trade of California and Colorado, the following special rates for California products have been made from Pacific Coast terminals to Denver, Colorado Springs and Pueblo:

C. L.	Per 100 lbs.
Beans.....	\$1 30
Canned goods.....	1 30
Fish, pickled.....	1 30
Lumber.....	64
Oranges.....	64
Sugar.....	1 30
Vegetables.....	1 00
Wine.....	1 30

For freight train service rates on live-stock between Pacific Coast common points and the places in the table, rates have been agreed upon as follows:

	Length of Cars.	Rates in dollars and cents per 1000 pounds. Minimum weight per car, 2000 pounds		
		Horses and Cattle.	Sheep.	Hogs and Pigs.
Missouri river common points, also St. Paul and Minneapolis, Minn., and Galveston and Houston, Texas.	30 ft. 2.00	1.50	1.40	
	33 ft. 2.20	1.65	1.54	
	34 ft. 2.27	1.70	1.59	
	35 ft. 2.33	1.75	1.63	
Mississippi river common points, Dubuque, Ia., to New Orleans, La., inclusive.	30 ft. 2.22	1.70	1.60	
	33 ft. 2.42	1.87	1.74	
	34 ft. 2.52	1.92	1.81	7-10
	35 ft. 2.60	1.98	1.86	3-10
Chicago, Milwaukee and points common there- with.	30 ft. 2.30	1.77	1.65	
	33 ft. 2.53	1.95	1.81	
	34 ft. 2.61	2.01	1.87	3-10
	35 ft. 2.68	2.07	1.92	2-10

Another table of considerable interest to both importers and exporters is the table of rates between Missouri-river points and Chicago and St. Louis, which is as follows:

	First Class.	Second Class.	Third Class.	Fourth Class.	Fifth Class.
Chicago.....	\$20	\$15	\$10	\$5	\$30
St. Louis.....	70	55	40	30	25
	A	B	C	D	E
Chicago.....	\$32 50	\$25 50	\$23	\$20	\$10
St. Louis.....	25	22	15	15	12

As far, therefore, as can be judged from present indications, the whole effect of the interstate-commerce bill on California freight has been to increase materially rates to Missouri river points and points east thereof, while the rates to local points, though increased, have yet been maintained in much the same relation to those ruling to the same points from the East as in the past.

T. H. Goodman, in conversation yesterday with a *Call* reporter, reiterated his former statement that passenger rates would remain much the same as they are at present. There may be, he said, a few changes to points west of the Missouri, for if any of our connections increase their rates a few dollars, we must make a similar change in our rate schedule. We will issue a new rate-sheet, however, on the 4th prox., but beyond such changes as may occur between now and then it will be substantially similar to that in use at present. In regard to excursions, Mr. Goodman stated that they would be continued at the same rate as at present, namely, \$80 for the round trip from Chicago to the coast, and \$60 from Missouri-river points, tickets to be good for six months.

British Columbia and Alaska.

The fact that gold has been discovered in several places in Alaska brings into prominence the question of the boundary line location between that Territory and British Columbia.

The line was strictly defined, so far as bearings are concerned, in the treaty documents that conveyed Alaska to the United States. This definition is similar to the points specified in 1825 by the Governments of Great Britain and Russia.

The peculiar manner in which the line intersects the Territory has formed a source of annoyance to miners and prospectors since 1870, and they have never been sure of their rights to any find in the district bordering upon the inland seas of the southeast portion of the Territory.

The situation of the new placer diggings on the Stewart river is probably in British territory. But to reach the location miners have to pass through a portion of the country claimed by the United States. No matter whether they proceed to the scene by the way of Juneau in the south or via St. Michaels to the Yukon river in the north, they must pass through United States territory. As long ago as 1870 the Hudson's Bay Company were occupying Fort Yukon, within the United States boundary line, but they speedily vacated the post when notified of the position. The rush to these Stewart-river diggings during the past winter and the coming summer has been and will be large. In 1886 three men brought over \$8000 worth of gold dust and small nuggets to this city, and now there are reports of new finds.

There is a steamer pumping on the bars of the small stream that serve as feeders to the Yukon below Fort Reliance, at which point the boundary line intersects the Territory on its track northward. It is the intention of one of the owners of this steamer to leave for the Yukon river in May, taking with him pumping apparatus and supplies.

The settlement of the boundary-line question will doubtless attract the attention of the Canadian Government at an early date, but other than levying a license tax upon the miners and requiring the payment of custom duties upon supplies, there is no probability of any serious trouble arising upon the rights of miners to work on British soil.

WOOD COMPRESSED IN MINES.—Many beautifully polished specimens of pine wood mentioned by the *Enterprise* a few days ago as having been taken from the 1500 level of the Consolidated California and Virginia mine are now to be seen about town. The wood having been compressed to one-fourth its natural size, is as firm and close-grained as boxwood, therefore it takes a fine polish. When it is polished it looks and feels exactly like petrified wood, and it is mistaken for such by all who see it for the first time. The specimens when polished are of a deep chestnut color. Though this wood was brought up to its present condition by exposure to 160 degrees of heat under immense pressure for a period of 12 years, it is thought the same effect might be produced in a few days by means of proper apparatus and appliances. A man who yesterday made the experiment says the compressed pine burns longer than coal.—*Virginia (Nev.) Enterprise*.

OWENS LAKE.—The *Inyo Independent* says: Up till the present time a large force of men and horses has been kept at work at Owens Lake, making pools or ground tanks for the evaporation of the lake water. It is said that as many of these tanks are now ready for use as will be wanted for some time, and that the working force will be reduced to what is needed to attend the pumping machinery and keep the tanks filled. Another experiment is about to be made in evaporating the water. An evaporator the length of a flat car has been sent to the lake, and this will be tried in comparison with the ground tanks.

Water-Power for Mining.

The introduction of water-power into the Grass Valley district for the purpose of operating the machinery of the quartz mines is working a revolution in favor of that industry, which will eventually be doing more good for the development of quartz mines in the next few years than in all the previous history of the district, as it gives a cheaper power than by the use of steam, and greatly reduces the expense of bullion production. One of the great items of expense in mining is the pumping that is necessary to be done, and along with the cost of steam machinery is the heavy and continuous cost of fuel, which is the formidable item that makes a heavy draft upon the exchequers of individuals or companies that undertake the opening of mines. A plant for water-power is not necessarily costly, and the saving in money over the use of fuel can safely be estimated at 33 per cent, which in many, and probably most instances, would be the difference between the success or failure of a mining enterprise—as while a mine would be worked as long as it paid but a small margin of profit, it would not be if the loss was a little the other way, but continuous. By the use of water, it can be, according to locality, used over several times, thus minimizing the cost and reducing expenses to such figures that very low grade ores can be worked to a profit, that otherwise must be left untouched. At the present time about 800 inches of water is being used in the district, supplied by the South Yuba canal, driving machinery under heavy pressure; other mines are preparing to obtain power from the same source. The Canal Company thus secures a constant and reliable market for its water, which can be taken to every mine in the district whether at present in operation or to be worked in the future. This advantage is so manifest that a number of mining properties, heretofore partially developed, but now idle because they could not be worked cheaply, will be revived, and become as reliable gold-producers as any of the past or present day. This is so manifest that the people of the district have full confidence in the future of the mining business, and properties are held at firmer stated valuation than ever before. The Grass Valley quartz district will continue in the lead in this State, as it has always been before, and a cheap water-power will enable it to maintain this position.—*Grass Valley Union*.

Shasta County Mines.

In an article on the resources of Shasta county, the *Shasta County Democrat* has the following to say of the mines: Our mines are of great importance. There is more wealth in them than in any of our resources, yet, our people who have the means to assist in developing them, let fortunes slip their grasp. To illustrate: Three years ago we could not convince our townsmen, who had means, that Old Diggins district possessed valuable mining property. Our own people scouted and were skeptical. What's the result? Thanks to Bell, Hopping & Co., and others, they persevered. Their perseverance attracted the attention of mining men from a distance. The old Central was sold for a song, and the new owners have refused \$100,000 for the property and are eager to purchase more claims surrounding this mine. Our townsmen who had the means would not touch the Squaw Creek mines. What's the result? Outside capital purchased the mines, proven to be valuable, and Jack Conant, who three years ago was so poor that he was barely able to purchase a sack of flour, to-day owns a fine mine, a fine mill, has his pockets lined with money, sports fine clothes and a plug hat. Outside capital purchased the Muchmore from under our noses. Outside capital purchased and seems to develop all the mines that are being developed, while our own citizens of means (save a baker's half dozen) squeeze the eagle for one per cent, and deny the honest, hard-working prospector a grub-stake. Our mountains and mining camps are full of good prospects. All our mines that are being worked are yielding large profits. What we need is a confidence that will impel our own folk to take hold and assist those that have prospects worth working. Open the mines, then capital will purchase. Wood and water are abundant. Quartz veins that prospect well in gold are actually numerous; all the outcroppings, conditions and formations are good. Seeing and knowing of the existence of these things, it is ample evidence to us that our undeveloped mining resources are simply wonderful.

THE LICK FREE BATHS.—Ira P. Rankin, one of the members of the sub-board of Lick Trustees, has made a statement to the effect that it is the intention of the board to have the free bath provided for in the will of James Lick ready for the use of the public in a short time. The plans of the baths have long been completed and a lot at the corner of Tenth and Howard streets was purchased for the purpose, when a suit against the property was commenced. The board, not wishing to encourage the scheme, has remained inactive until the suit could be settled. There is every probability of the suit being dismissed in a short time, and as soon as it is, work on the baths will be commenced.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WASH-BOILER.—Hiram H. Tuttle, S. F. No. 359,650. Dated March 22, 1887. This invention relates to that class of wash-boilers in which a circulation of water and steam is obtained by means of vertical tubes. The invention consists in a combination of devices. The object is to provide a wash-boiler in which the circulation of water and steam shall be general and perfect.

PUMP.—L. L. Bettys, Mountain View, Santa Clara Co. No. 359,764. Dated March 22, 1887. This submerged or deep-well pump consists of a cylinder receiving water through independent ports—one on its base and the other in its side—a double plunger having one of its heads solid, and adapted to operate in connection with the lower entrance port of the cylinder, and its other head hollow and provided with a valve, said head being adapted to operate in connection with the side entrance-port of the cylinder, a side pipe in communication below with the base of the cylinder and with the discharge pipe above, a valve controlling the entrance to the side pipe, a valve in the cylinder controlling its communication with the discharge pipe, and various details of construction.

LIFE-BOAT.—Augustin Battard, Santa Rosalie, Lower California, Mexico. No. 359,762. Dated March 22, 1887. This improvement in vessels is specially applicable to life-boats and those that are exposed to heavy seas or surf. It consists in the combination, on a boat, of one or more cylindrical or conical drums or chambers, having axes upon which they are loosely journaled above the center of gravity of the boat, so that they may act to keep the boat in an upright position, or to immediately return it to that position if it should be upset by the violence of the waves. By being loosely journaled, as described, the blows or force of the waves or surf will be greatly lessened when they strike the boat with violence. By having these buoyant hollow floats above the center of gravity, if the boat is upset in the breakers or waves, it will be turned upright again when the wave has passed.

THE TIME TO MOVE.—Now is the time for the miners to begin the development of their claims. The season is opening up favorably, and time should not be lost in idling about waiting for some one with capital to come along to buy mines at fabulous prices. If you have a good mine, show your faith in it by working it yourself, if possible. If you are unable to work it yourself, take a reasonable price for it when a buyer comes along. It is far better for a poor man to do this than take the desperate chances of getting a high price. Many times prospectors have been offered prices which to them seemed low, but which, in reality, were moderate. They held out for large prices, and to-day many of the same men regret their failure to sell at the prices offered. If you cannot operate your mine yourself, sell it when a reasonable sum is offered, and the chances are that you will be much better off by so doing.—*Greenview (Plumas Co.) Bulletin*.

A CORNER IN SALT.—It has been generally known for weeks that a quiet yet strong effort was making to have all the saltmakers lease their ground to a syndicate for a term of five years. The business was finally concluded this week. From all we can learn we are satisfied that it is a good thing for the salt-men. This syndicate is composed principally of the American, Union Pacific and Carmen Island Salt Companies, D. F. Bartou and Plummer Bros. But the "big fish" are the three companies above mentioned. About 21 salt-men being the full number, have agreed to the syndicate proposition. It now remains to be seen whether the syndicate will remain a "happy family" for five years to come. We earnestly hope so. Salt is liable to jump to \$5 per ton before many weeks. Now is the time to lay in a supply.—*Haywards Journal*.

SANTA BARBARA PRESS: Dr. Walker Fuchs, the prominent scientist, who is now making deep-sea soundings in the Santa Barbara channel for the Agassiz Association, has just returned from a trip to the islands. He reports that he found there a cave which greatly resembles the celebrated "Blue Grotto" of Capri, only far more beautiful.

DURING the year 1886 the bullion and mineral product of Socorro county, N. M., reached the sum of \$2,632,133.41. In the year 1882 the county made no output. These figures alone should indicate to an unbiased mind that New Mexico possesses strong claims upon the attention of mining men and capitalists seeking legitimate investment.—*Socorro Bulletin*.

THE Mount Cory people are thinking of putting concentrators in the big mill before starting it. Until they decide whether they want concentrators in the mill, or a small mill and concentrators near the mine, they will do nothing toward reducing the ore which they now have.—*Silver State*.

TELEGRAPHY IN CHINA.—It is stated that the Marquis Tseng, who has lately returned to China from his long residence as representative of that empire in London, has signified his arrival in his native country by earnest endeavors to have a line of telegraph completed between Peking and the most important centers in China. He has submitted plans prepared by competent men to the Imperial Government, and it is expected that these will shortly be accepted.

The Late Dr. Kellogg.

Dr. Albert Kellogg, the last one of the charter members of the California Academy of Sciences, died at his residence in Alameda on Friday last, in the 71th year of his age. Dr. Kellogg was one of the best known scientists on the coast, having devoted himself to botanical research in this State for the last 30 years. For the past three or four years he has been working at the Academy on a small salary derived from the Crocker Scientific Investigation Fund—money donated by Charles Crocker for the assistance of those persons who, by their devotion to scientific pursuits, have incapacitated themselves from following ordinary avocations. Dr. Kellogg has devoted a great deal of his time of late years to investigation of the Pacific Coast forest trees, on which subject he was an authority.

As one of the earliest workers in botany on this coast, he found a wide field for research, and has described hundreds of new species from time to time. The results of a great deal of his work have appeared in the published proceedings of the Academy. A large amount of MSS., however, is still unpublished. He has in his day traveled all over the coast in his botanical trips, but for the past few years physical infirmity has prevented active field work.

Dr. Kellogg was one of the most simple-minded of men, thoroughly devoted to his chosen branch of science, and utterly regardless of all pecuniary rewards. Gentle in manner, unselfish and pure in thought and deed, he endeared himself to all with whom he came in contact. He was always willing and pleased to assist students and investigators of less experience. His was an exceptional character in many respects. Leading an uneventful and quiet life, and pursuing his favorite study, he passed his days free from all the worries of a money-getting career. An enthusiast in botany, and a man of close observation, it is no wonder that he accomplished a vast amount of good work in his time. The Academy of Sciences loses one of its most valued workers, and one who was thoroughly devoted to its interests.

At the meeting of the Academy on Monday evening, an adjournment was taken out of respect to the memory of Dr. Kellogg. A committee, consisting of Dr. Geo. Horvath, E. L. Greene and Dr. H. Behr, was appointed to prepare suitable resolutions, to be read at the meeting of the 18th inst. Memorial services will be held on Sunday, April 10th, in the Swedenborgian church, in this city.

In this connection it may be stated that through the suggestion of ex-President Geo. Davidson, of the Academy, a lot will be purchased in the cemetery at Oakland and laid out to receive the remains of deceased scientists, in case no other provision has been made for them. Capt. Kohl, of the Alaska Commercial Co., has already donated \$100 for the purpose.

The Sutro Tunnel.

At Carson, Nevada, on the 4th inst., the Sutro Tunnel Company, through its attorney, Theodore Sutro, applied to the United States Circuit Court, of Nevada, for leave to amend the answer in the foreclosure suit brought by McCalmont Bros. & Co. against it, by presenting additional defenses. The application was filed by Theodore Sutro and Col. M. N. Stone, on behalf of the company, and resulted in an order from the court granting to the Tunnel Company leave to amend, and 40 days' time within which to take further testimony, and 40 days additional for the plaintiff to take testimony in rebuttal. The court also ordered that the receiver pay to the plaintiff the money in his hands, without prejudice to the defense, retarding \$25,000 for contingent expenses, thereby avoiding the loss of interest to the company. The rulings of the court are an important gain to the company.

In this connection it may be stated that the Virginia Enterprise says that the Sutro tunnel, which was formerly controlled by the McCalmont Brothers, the bankers of London, and who hold the mortgage on the company's property and franchise, has now passed into the hands of the stockholders in New York City, by the election which took place Monday, March 28th. The suit now pending against the property in foreclosure will probably be withdrawn or compromised by the payment of the amount due the McCalmonts, of London, and

the property, which is now yielding a monthly income of about \$30,000, with the prospect of being largely increased, is expected to place the company on a paying basis.

Mending Cables.

All the great Anglo-American Telegraph Companies keep a neat little steamer for cable-repairing purposes. When a break or defect in the cable occurs it may be discovered from the shore station, and located within a few hundred yards by the skillful electrician. The little

Fig. 3. RICHARDS' COMPOUND CONDENSING ENGINE AND DRAINING PUMP.

steamer is then sent out to repair the fault, and sails to within a half or three-quarters of a mile of the break. A strong hempen rope, wire-strengthened, is then let down with a large grapnel at the end. This grapnel has four hooks, at the base of which is a small iron pin about a half-inch in diameter, which is pressed in when the weight of the cable comes upon

Richards' Patent Hydraulic Machinery.

NUMBER 2.

Fig. 3 of the accompanying engravings shows a steam centrifugal pumping engine.

These engines are of the compound type, having a trunk-piston reducing the acting area of one stroke to one-half that in the other, the steam being transferred from one side to the other and used twice, the same as in the case of two cylinders, the valves and ports being arranged with proportions corresponding to volume of steam at the different pressures.

Fig. 3. RICHARDS' COMPOUND CONDENSING ENGINE AND DRAINING PUMP.

This method of working is not new. It has been applied to at least one steamer on this coast, and has been carried out in some successful-working engines made at the Richmond Iron Works, in this city. The new features of the present engines consist in the method of their construction, the working parts being lashed in the main framing to secure lubrication, as in

Fig. 4. RICHARDS' PATENT COMPOUND CONDENSING STEAM ENGINE.

it; this pressure closes the circuit in a small wire in the center of the grapnel, ringing a bell in the electrician's office. When the light of the cable has been hooked it is pulled to the surface, with greater or less difficulty, according to the depth of the water. It is then cut and the end set in a tablet in the office of the steamer, so that the electrician can test it, let us suppose, first to the westward, and finding that he cannot reach the shore in that direction, he then tries it in the opposite direction and locates the break exactly. The shore end is then lowered and the cable is pulled on the deck of the vessel, by means of an engine connecting with a great drum, and when the fault is discovered it is cut out and spliced and then paid out into the deep.

the case of Mr. Richards' and other single-acting engines, in a new form of connecting rods, and the condensing apparatus by which is secured a vacuum duty on the large or low-pressure piston.

The arrangement in connection with a centrifugal pump shown in the drawing is exceedingly compact and simple, dispensing with most of the foundation work usually required.

The condenser is in the sole plate and the air-pump behind the engine in the present view. Condensing apparatus is desirable in cases where continuous duty is required and where fuel is dear. It is attained here at moderate expense in first cost and without loss of room.

Fig. 4 is a front view of one of the engines just described, showing air-pump and other details.

Foundry Notes.

At the Golden State and Miners' Iron Works they are building one of J. B. Osborne's steam wagons of the pattern which we described in the Press of Nov. 20th last, page 38d. The new steam wagon is for use on the Mojave desert to haul ore from mine to mill, a distance of nine miles. The boiler on the machine is of locomotive pattern, and the two engines have 61-inch cylinders, 12-inch stroke. They are geared to make 30 revolutions to one of the main driving-wheels. The main driving-wheels are 6 feet in diameter and 14 inch face. The steering is done by steam. The traction engine is about 25 feet long. It carries its own coal and water. The machine is intended to have a train of four wagons each with 25 tons of ore. Each wagon has a separate engine, furnished with steam from the main boiler on the forward engine. The main wagon weighs, loaded, 22 tons, and each cart 30 tons when loaded.

The following is a brief statement of the machinery which has recently been furnished by the Joshua Hendy Machine Works: One double circular sawmill complete with necessary steam-power for use in Shasta county; one outfit for sawmill, and required steam-power also, shipped for use in the same county; one complete hydraulic plant, consisting of a 20-inch hydraulic gravel elevator, necessary hydraulic pipe, water-gates and flants for hydraulic mining in Shasta county. It may be here stated that, although our journals teem with accounts of the "boom" which has overtaken the sunny southern portion of our State, and in which we, of course, rejoice, yet it will be found that even that portion of our State which we have been led to consider as the frozen north is performing its own good work in contributing to the channels of foreign and interstate commerce the usefulness of its vast forests and the wealth of its mines.

The same works have also just completed and shipped a complete hoisting and pumping plant for use in Inyo county in developing a mine belonging to one of the distinguished candidates for the Democratic nomination in the last gubernatorial campaign. They have further furnished for the Fort Shasta Lumber Co., a battery of five steel boilers of the best form of construction and fully equipped with the latest improved fittings. They have also furnished to the Lighthouse Department of the 12th District, under the able supervision of Captain A. H. Payson, Corps U. S. Engineers, one boiler and fittings for Point Montara, boiler for Point Reyes and a boiler and log-saw engine for Verba Buena Island, all of which were constructed under specifications from the U. S. Engineer's office and subjected to Government inspection and duty accepted. They have supplied for the use of the cannery at Astoria, Oregon, under the management of Messrs. W. T. Coleman & Co., a large and complete boiler. They report the sales of several boilers and engines for use in the Southern counties, and that their business in the special manufacture of automatic ore feeders and Triumph concentrators, and sales of same, have been exceedingly good, and large orders have been filled and are in hand for Idaho, Montana, Dakota, New Mexico, Mexico and our own State of California.

Having recently accepted the agency for the sale of the celebrated hand-log sawmills manufactured by Messrs. Smith, Myers & Schinner, of Cincinnati, Ohio, they have entered into a contract with J. P. Pierce, Esq., manager of the Pacific Mills Lumber Company, of Pacific Mills, Santa Cruz county, for the furnishing for the use of that company of one of their largest size of hand-saw mills, and when it shall have been received and placed in operation the agents extend a cordial invitation to those who are interested in sawmill or lumber enterprises to visit and examine this mill, which is believed to be superior to any other similar form of mill yet placed in operation in our State.

SILVER MINERS are anxious to know when the "bottom notch" for silver will be reached. A short time ago it was over 100, and now it is down to 93½ per ounce. For value is supposed to be \$1.20. With the present heavy discount, considerable loss is entailed on all silver producers.

Entrepreneurs have discovered some rich ore in Summit canyon, Nye county, Nev.

Passing Events.

This week the railroads began work under the Interstate Commerce law, concerning the probable effect of which on our industries on this coast there is so much difference of opinion. The through freight rates have been raised considerably, as shown by an article on this subject in another column.

The rain which fell on Wednesday seems to have been experienced over a large area in California, and has done a great deal of good. There has been some fear that lack of late rains would be detrimental to the crops.

Spring has now fairly set in, and we hear from the interior that prospectors are again out in the hills.

The Gold Belt mines up in the Wood River region, Idaho, are commencing to attract considerable attention. A number of good mines have been opened.

Alaska mines are again alluring prospectors to that far-off region. The Yukon and Stewart River countries will be pretty well prospected this year. Reports of very rich finds prevail, and numbers of miners are going to try their fortunes this summer in Alaska.

Interstate Commerce and Ore Shipments.

The statement is being printed in some of the interior papers of this State that the operations of the Interstate Commerce law will cripple mining where ores have to be shipped from or through one State to another. And it is stated that this will stop "chloriding," and injure also men who are working small ledges and shipping their ore.

These statements need modification. In fact, they may be said to be entirely incorrect. We have made inquiries on the subject, and find there is to be no advance at all, as far as the railroads terminating in this city are concerned. On the contrary, the railroad managers are disposed to reduce the rate on ores as far as possible. At present they will keep the special rates heretofore given on ores, bullion, concentrates, etc.

It may not be generally known that when concentrate first began to be shipped by rail the roads charged higher rates on them than on ore, as they were the product of rich ores. But now that systems of concentration are in such general use, and low-grade ores are concentrated, which as ores could not be shipped, concentrates are rated the same as ores and are so named on the shipping list.

As far as the ores, etc., from Nevada, Arizona and other States and Territories are concerned, those who receive them here are satisfied that the same policy will prevail with the railroad company as was the case before the Interstate Commerce Act became the law. The railroad company now fully realizes the importance of encouraging mining developments in the different portions of the country, and show the industry all the favor that they can.

There will naturally be some changes in the direction in which ores are shipped. The operations of the law will be rather favorable to California than otherwise. Heretofore the Omaha smelters have received very low special rates from the Union Pacific railroad and connections, which enabled them to take certain classes of ores to the other side of the mountains, and at the same time they had the rates put up on ores coming to California, so as to drive them the other way. Now the operation of the new law will make rates uniform each way, and a great deal of ore will come to San Francisco to be worked which formerly went Eastward, the distance here being shorter. This will widen the scope of operation for California considerably.

Inquiry of Mr. Ralston, president of the Selby Smelting Works, the largest establishment on the coast, shows that these views are held by their company. In view of investigations made by them on the subject, they are satisfied that the results of the workings of the new law will be favorable to metallurgical operations in California. At any rate, they are so far convinced that they are now extending their facilities and putting up new furnaces to accommodate the increased business. They say the railroads are now disposed to encourage mining, and the output of the coast mines will be increased, so that the company are obliged to increase their facilities to treat all the ores that come.

Ore and bullion shipped to many points east of the mountains, heretofore, will now come in this direction on account of the less freight for the shorter distance.

SUGAR AS BOILER-SCALE PREVENTIVE.—M. Palto, an Italian officer, has found that the addition of two kilograms of sugar to the water in a tubular boiler of 126 tubes effectively prevents the formation of an incrustation, and at the same time removes incrustations which have been previously formed. It should be noted, however, that sugar, at the temperature corresponding to four or five atmospheres, rapidly gives rise to the formation of acids, notably formic acid, and these acids energetically corrode the boilers. For this reason the use of sugar as a disinfectant should be avoided.

THE Esmeralda News is informed of the sale of the Sweetwater mines. The new owners are Chicago capitalists, and intend spending a considerable amount of coin in building a mill suitable to crush the ore and to start the mines in full blast.

WORKMEN at the Reno reduction works are suffering from lead poisoning.

Primary Labor Schools.

One of our sorest industrial needs is the providing of suitable work for the young and insuring for them such training as will enable and incline them to do this work—not brain work, but manual labor. Technical education is good in its place, but it is not the want of the masses. They must go directly upon the farm or into the factory, cannery or workshop, with no other preparatory training than can in the larger cities be obtained in manual schools—rudimentary workshops. And we are not so sure but the sooner they are got into these places the better. It may be said that the child that is old enough to go to school is almost old enough to go to work. There is a danger that we are laying too much stress on education as an element of success in after-life, and too little on the importance of setting our youth early to work.

This being a matter of such vital importance, we are glad to see that the newly-appointed Commissioner of the Labor Bureau proposes to inquire into the feasibility of establishing schools of this kind in San Francisco, it being his intention to found here one or more of these institutions, if his present favorable opinion of their usefulness shall be confirmed on further investigation, and the Legislature, at its next session, is disposed to co-operate with him to that end. What renders these training schools the more necessary is the extent to which boys are now excluded from the mechanical trades, employers being allowed to take but a limited number of apprentices. Entering one of these schools, the boy will be able to learn most common trades nearly or quite as well as in the factory or shop. The Commissioner speaks of taking the youth after they have got through with their schooling. This will do, provided they are not kept in school too long. Boys and girls who are kept constantly in the public schools until they are 16 or 17 years old are apt to think they must live by their wits and learning, and therefore rarely ever take kindly to manual labor. The better plan would be to set them to work much earlier, allowing them to go to school a little meantime, say a month or two every year. Or they might, in many cases, attend night schools quite steadily, if so inclined. Boys, after receiving a rudimentary education, such as the most of them obtain in our common schools, by the time they are 12 or 14 years of age, had better be set to doing work of some kind, care being taken that they are not overworked.

It will not, of course, be possible for our entire youthful population to find employment in mechanical and manufacturing pursuits. Many, and perhaps the most, of them will have to take themselves to the land and the mines for a living. What openings these will be likely to furnish to our young people, the importance of our establishing new industries and the inducements that exist here for doing so are subjects on which we will have something more to say in the next issue of the PRESS.

Mineralogical Notes.

A twin crystal of molybdenite has been found near Renfrew, Canada, with other remarkable crystals, some of which weighed nearly a pound.

At Los Cerillos, New Mexico, about 22 miles southwest of Santa Fe, are mines of turquoise which have been worked for centuries. The turquoise occurs hurried in its matrix, sometimes in nodules, often in veins, and varies in color from pure sky-blue to dark-green. A microscopic study of the turquoise indicates that the mineral may have been derived from the alteration of another substance (apatite) with which the vein was formerly filled. The turquoise-bearing rock appears to be eruptive, and probably of tertiary age. Under the microscope it is seen to be composed of feldspar, with a considerable amount of biotite, epidote, iron pyrites, limonite, and some amorphous substance.

OWING to the tricks of the Chinese miners in Northern Idaho, the people are demanding a gold-coin basis in their dealings with them, say an exchange. They mix dust worth \$8 per ounce with that worth \$16, and dispose of it at the maximum figures. Besides this, they fail to burn their fine dust sufficiently, thereby retaining much quicksilver, and also file up silver dollars and mix the filings with the gold.

Technical Society of the Pacific Coast.

President Mendell was in the chair at the last meeting of the Technical Society of the Pacific Coast. M. G. Wheeler, City Engineer of San Diego, and N. S. Keith, electrician, were elected members.

Mr. H. T. Compton, of the Engineers' Department of the State Harbor Commission, read a paper "On a New Method of Differentiation." The object of this paper was to explain a new method of obtaining the differentials of functions of a single variable or of several variables, which is believed by Mr. Compton to be logical and conclusive, and to leave no doubts in the mind of the student as to its absolute correctness. In no text-book on calculus which he had seen is there a clear proof that the limit of the increment of the function, divided by the increment of the variable, is equal to the ratio of the differential of the function to the differential of the variable. All that is proved in the operations in the text-books in question is a particular value for the symbol—for each particular case. Mr. Compton gave several examples of his method on the blackboard.

N. S. Keith read a paper "On the Transmission of Power by Means of Electricity." In the matter of the production and utilization of electricity great strides had been made within the last decade, so that now many things which are viewed as problematical, even in the scientific world, a very few years ago, have been assured commercial facts owing to the improvements made by experimenters in apparatuses for generating electricity.

Prof. Keith's paper was an excellent one, and was listened to with marked interest. It gave the members a very good idea of what had been and is now being accomplished with electricity in furnishing power. At the conclusion of the paper, Prof. Keith answered many questions put to him by the different members, which showed the interest felt in the subject.

Which is the Precarious Business?

How much wheat, wine, fruit or other of her agricultural staples California will produce this year we are unable to say. As much, probably, as usual. We hope so; still, this depends on many contingencies—on the later rains, the insects, the hogs, the rust and "the north wind's breath." What injury these or any of them may inflict on the growing crops no one can say. There lives not the man who can forecast these things. Now, if any there be curious to know how much bullion the mines of California will turn out the current year, though not gifted with the spirit of prophecy, we will tell them very nearly. The sum will amount to about \$20,000,000, sixteen millions gold and four millions silver. We predict that the total will come within a million of the largest figure mentioned; moreover, we are of the opinion that there will be realized on the capital invested in this business a net profit of 30 per cent.

Will parties engaged in any of our other leading industries, mercantile, manufacturing or lumbering, for instance, undertake to tell us as nearly as this how they are going to come out at the end of the year? Let now the wisecrack favor us with a homily on the uncertainty of mining!

NEW ZEALAND GRAPHITE.—Large quantities of graphite exist at Packawan Bay, in Golden Bay, N. Z., which will sooner or later be turned to commercial account. Samples were analyzed just as they were taken from the ground, with the following results:

	No. 1.	No. 2.
Carbon.....	34.99	51.45
Ash.....	.65 01	48.55
	100.00	100.00

No. 2 appears to be as good in quality as much of the graphite sold in commerce for common purposes.

TELEGRAPHS IN CHINA.—It is stated that the Marquis Tseng, who has lately returned to China from his long residence as representative of that empire in London, has signalized his arrival in his native country by earnest endeavor to have a line of telegraph completed between Peking and the most important trade centers in China. He has submitted plans prepared by competent men to the Imperial Government, and it is expected that these will shortly be accepted.

The Late Dr. Kellogg.

Dr. Albert Kellogg, the last one of the charter members of the California Academy of Sciences, died at his residence in Alameda on Friday last, in the 74th year of his age. Dr. Kellogg was one of the best-known scientists on the coast, having devoted himself to botanical research in this State for the last 30 years. For the past three or four years he has been working at the Academy on a small salary derived from the Crocker Scientific Investigation Fund—money donated by Charles Crocker for the assistance of those persons who, by their devotion to scientific pursuits, have incapacitated themselves from following ordinary occupations. Dr. Kellogg has devoted a great deal of his time of late years to investigation of the Pacific Coast forest trees, on which subject he was an authority.

As one of the earliest workers in botany on this coast, he found a wide field for research, and has described hundreds of new species from time to time. The results of a great deal of his work have appeared in the published proceedings of the Academy. A large amount of MSS., however, is still unpublished. He has in his day traveled all over the coast in his botanical trips, but for the past few years physical infirmity has prevented active field work.

Dr. Kellogg was one of the most simple-minded of men, thoroughly devoted to his chosen branch of science, and utterly regardless of all pecuniary rewards. Gentle in manner, unselfish and pure in thought and deed, he endeared himself to all with whom he came in contact. He was always willing and pleased to assist students and investigators of less experience. His was an exceptional character in many respects. Leading an uneventful and quiet life, and pursuing his favorite study, he passed his days free from all the worries of a money-getting career. An enthusiast in botany, and a man of close observation, it is no wonder that he accomplished a vast amount of good work in his time. The Academy of Sciences loses one of its most valued workers, and one who was thoroughly devoted to its interests.

At the meeting of the Academy on Monday evening, an adjournment was taken out of respect to the memory of Dr. Kellogg. A committee, consisting of Dr. Geo. Hewston, E. L. Greene and Dr. H. Behr, was appointed to prepare suitable resolutions, to be read at the meeting of the 18th inst. Memorial services will be held on Sunday, April 10th, in the Swedenborgian church, in this city.

In this connection it may be stated that through the suggestion of ex-President Geo. Davidson, of the Academy, a lot will be purchased in the cemetery at Oakland and laid out to receive the remains of deceased scientists, in case no other provision has been made for them. Capt. Kohl, of the Alaska Commercial Co., has already donated \$100 for the purpose.

The Sutro Tunnel.

At Carson, Nevada, on the 4th inst., the Sutro Tunnel Company, through its attorney, Theodore Sutro, applied to the United States Circuit Court, of Nevada, for leave to amend the answer in the foreclosure suit brought by McCalmont Bros. & Co. against it, by presenting additional defenses. The application was filed by Theodore Sutro and Col. M. N. Stone, on behalf of the company, and resulted in an order from the court granting to the Tunnel Company leave to amend, and 40 days' time within which to take further testimony, and 40 days additional for the plaintiffs to take testimony in rebuttal. The court also ordered that the receiver pay to the plaintiffs the money in his hands, without prejudice to the defense, retaining \$25,000 for contingent expenses, thereby avoiding the loss of interest to the company. The rulings of the court are an important gain to the company.

In this connection it may be stated that the Virginia Enterprise says that the Sutro tunnel, which was formerly controlled by the McCalmont Brothers, the bankers of London, and who hold the mortgage on the company's property and franchise, has now passed into the hands of the stockholders in New York City, by the election which took place Monday, March 28th. The suit now pending against the property in foreclosure will probably be withdrawn or compromised by the payment of the amount due the McCalmonts, of London, and

the property, which is now yielding a monthly income of about \$30,000, with the prospect of being largely increased, is expected to place the company on a paying basis.

Mending Cables.

All the great Anglo-American Telegraph Companies keep a neat little steamer for cable-repairing purposes. When a break or defect in the cable occurs it may be discovered from the shore station, and located within a few hundred yards by the skillful electrician. The little

Fig. 3.—RICHARDS' COMPOUND CONDENSING ENGINE AND DRAINING PUMP.

steamer is then sent out to repair the fault, and sails to within a half or three-quarters of a mile of the break. A strong hempen rope, wire-strengthened, is then let down with a large grapnel at the end. This grapnel has four hooks, at the base of which is a small iron pin about a half-inch in diameter, which is pressed in when the weight of the cable comes upon

Richards' Patent Hydraulic Machinery.

NUMBER 2.

Fig. 3 of the accompanying engravings shows a steam centrifugal pumping engine.

These engines are of the compound type, having a trunk-piston reducing the acting area of one stroke to one-half that in the other, the steam being transferred from one side to the other and used twice, the same as in the case of two cylinders, the valves and ports being arranged with proportions corresponding to volume of steam at the different pressures.

Fig. 4.—RICHARDS' PATENT COMPOUND CONDENSING STEAM ENGINE.

it; this pressure closes the circuit on a small wire in the center of the grapnel, ringing a bell in the electrician's office. When the bite of the cable has been hooked it is pulled to the surface, with greater or less difficulty, according to the depth of the water. It is then cut and the end set in a tablet in the office of the steamer, so that the electrician can test it, let us suppose, first to the westward, and finding that he cannot reach the shore in that direction, he then tries it in the opposite direction and locates the break exactly. The shore end is then buoyed and the cable is pulled on the deck of the vessel, by means of an engine connecting with a great drum, and when the fault is discovered it is cut out and spliced and then paid out into the deep.

This method of working is not new. It has been applied to at least one steamer on this coast, and has been carried out in some successful-working engines made at the Risdon Iron Works, in this city. The new features of the present engines consist in the method of their construction, the working parts being inclosed in the main framing to secure lubrication, as in

Foundry Notes.

At the Golden State and Miners' Iron Works they are building one of J. B. Osborne's steam wagons of the pattern which we described in the PRESS of Nov. 20th last, page 336. The new steam wagon is for use on the Mojave desert to haul ore from mine to mill, a distance of nine miles. The boiler on the machine is of locomotive pattern, and the two engines have 6½-inch cylinders, 12-inch stroke. They are geared to make 30 revolutions to one of the main driving-wheels. The main driving-wheels are 6 feet in diameter and 14-inch face. The steering is done by steam. The traction engine is about 25 feet long. It carries its own coal and water. The machine is intended to have a train of four wagons each with 25 tons of ore. Each wagon has a separate engine, furnished with steam from the main boiler on the forward engine. The main wagon weighs, loaded, 22 tons, and each cart 30 tons when loaded.

The following is a brief statement of the machinery which has recently been furnished by the Joshua Hendy Machine Works: One double circular sawmill complete with necessary steam-power for use in Siskiyou county; one outfit for sawmill, and required steam-power also, shipped for use to the same county; one complete hydraulic plant, consisting of a 20 inch hydraulic gravel elevator, necessary hydraulic pipe, water-gates and giants for hydraulic mining in Siskiyou county. It may be here stated that, although our journals teem with accounts of the "boom" which has overtaken the sunny southern portion of our State, and in which we, of course, rejoice, yet it will be found that even that portion of our State which we have been led to consider as the frozen north is performing its own good work in contributing to the channels of foreign and interstate commerce the usefulness of its vast forests and the wealth of its mines.

The same works have also just completed and shipped a complete hoisting and pumping plant for use in Inyo county in developing a mine belonging to one of the distinguished candidates for the Democratic nomination in the last gubernatorial campaign. They have further furnished for the Port Blakely Lumber Co. a battery of five steel boilers of the best form of construction and fully equipped with the latest-improved fittings. They have also furnished to the Lighthouse Department of the 12th District, under the able supervision of Captain A. H. Payson, Corps U. S. Engineers, one boiler and fittings for Point Montara, boiler for Point Reyes and a boiler and fog-signal engine for Yerba Buena island, all of which were constructed under specifications from the U. S. Engineer's office and subjected to Government inspection and duly accepted. They have supplied for the use of the cannery at Astoria, Oregon, under the management of Messrs. W. T. Coleman & Co., a large and complete boiler. They report the sales of several boilers and engines for use in the Southern counties, and that their business in the especial manufacture of automatic ore-feeders and Triumph concentrators, and sales of same, have been exceedingly good, and large orders have been filled and are in hand for Idaho, Montana, Dakota, New Mexico, Mexico and our own State of California.

Having recently accepted the agency for the sale of the celebrated band-log sawmills manufactured by Messrs. Smith, Myers & Schiner, of Cincinnati, Ohio, they have entered into a contract with J. P. Pierce, Esq., manager of the Pacific Mills Lumber Company, of Pacific Mills, Santa Cruz county, for the furnishing for the use of that company of one of their largest sizes of band-saw mills, and when it shall have been received and placed in operation the agents extend a cordial invitation to those who are interested in sawmill or lumber enterprises to visit and examine this mill, which is believed to be superior to any other similar form of mill yet placed in operation in our State.

SILVER MINERS are anxious to know when the "bottom notch" for silver will be reached. A short time ago it was over 100, and now it is down to 93½ per ounce. Par value is supposed to be \$1.29. With the present heavy discount, considerable loss is entailed on all silver producers.

PROSPECTORS have discovered some rich ore in Summit canyon, Nye county, Nev.

MECHANICAL PROGRESS.

The Use of Steel in Russia.

The Russian Government, through its ministry of roads, has decreed and published a series of regulations concerning the use of steel in the construction of all work connected with railroads and railroad bridges, which show a degree of care taken by that Government in the construction of such means of transportation, which might well be considered, if not imitated, by our own Government, especially in view of the recent disastrous bridge accidents which have been attended by such great loss of life. We append a brief summary, as follows:

1. Steel, whether Bessemer or Siemens-Martin, may be used in all structures.

2. In view of the great sensitiveness of steel to mechanical working, it is to be noted that:

(a.) Plates and other sections must be tempered, after rolling, by means of the sand-bath. Care must be taken that on leaving the rolls the metal is not below a cherry-red heat.

(b.) Holes must not be punched, but drilled. (c.) When worked cold, the material must not be sheared, but cut with a chisel. The edges must be planed. All boring must be done hot, and provision be made for subsequent slow cooling.

3. The material must possess the following properties:

(a.) It must contain from 0.05 to 0.20 per cent of carbon.

(b.) Except for rivets, the tensile strength of all kinds of steel must be from 25.4 to 29.8 tons per square inch, extension at least 18 per cent, and the contraction of area at least 36 per cent.

For rivets, the tensile strength must be from 22.2 to 25.4 tons per square inch, extension at least 20 per cent, and contraction of area at least 50 per cent. The percentage of carbon for rivets must approach the lower limit (see a). Extension and contraction of area are to be measured on test pieces of 10 inches in length. The test pieces must be worked cold.

4. A strip of the metal 10 or 12 inches in length, heated to cherry red, and then plunged into water at 85½ degrees Fahr., must not show any cracks when so bent that the inner faces of the bent piece, at a distance from the angle of one and one-half times the thickness of the plate, are three times the thickness of the plate apart.

The permissible strain upon all material used in bridges is given in full detail, graduated according to the length of span, character of bracing, etc.

Iron and steel may be used in the same structure, but with the limitation that in each member of the group of similar parts the same material is to be used. For instance, the top and bottom booms of a girder form such a group; the diagonals and verticals of a girder, the cross and longitudinal roadway bearers, are other such groups, etc.

"SCAMPED" PIG IRON.—During the year 1879-80 a large quantity of very poor pig iron was shipped to this country from Great Britain. Its quality was very soon discovered, and for years much of it has stood piled up in one place or another, taking up valuable space or increasing its already too great cost by storage and interest charges. In some cases a little—very little—of it has been used occasionally in a mixture, usually with the result that it has been found a good thing not to use. The cause of the poor quality of this iron was not well understood until quite recently, when, from some proceedings in an English court, the fact came out in evidence that the Monkland Iron Co. (Scotch) used no less than 3500 tons of mill cinder to mix with their ores to keep their furnaces running for only 4½ months. Given a furnace as small as the Monkland running of Scotch iron ore, with a large per cent of mill cinder as a mixture, and what must the iron be? No wonder it sells for \$2.50 a ton less than standard brands.

WIRE ROPE—NEW MODE OF MANUFACTURE.—Hitherto on the fracture of a wire or wires composing ropes, the wire or wires are liable in usage to detach from their fellows, thereby proving a source of weakness to the rope. To prevent this detachment Mr. F. W. Scott, of Reddish, proposes to combine two of the wires forming the outer or inner wire of a strand or rope in such a form as to prevent the escape of a fractured wire or prevent the detachment of a fractured wire from its fellows. He binds the two outer or any inner wires with a clip or guard of thin steel in such a manner so as to grip the wires in pairs tightly together, a number of which are afterward twisted together, forming a strand or rope. The edge of the clip is free from the outer periphery of the outside wires, passing beyond the center of the diameter of the wire so as to securely hold them in position.

SWORD-BLADES.—The character of sword-blades and bayonets furnished to the British army and navy is still a subject of discussion in Great Britain. The "scamping" resorted to, for the purpose of securing unjust gains out of contracts for furnishing the weapons for the Government, has led to an almost total discontinuance of the manufacture of the blades in England, and they are now imported from

Germany. Sword-blades in this rough are also largely imported into this country, and the weapon merely "finished" here. It would seem that our native mechanics ought to be able to turn out good work at prices which dealers can stand. If not so, let our mechanics be "protected" until they can do so.

Tempering Drills to Drill Saw Plates.

A correspondent of the *Blacksmith and Wheelwright*, who has been running circular saws and gearing and filing and setting saws for the past ten years, after having a great deal of trouble to get a drill tempered to drill holes in cracked saws, has finally discovered a plan to accomplish this work which he says never fails. It is as follows:

After learning the grade of the steel and what heat it will stand, procure the best drill steel and forge out to shape, leave it as heavy above the drill point as it can be and still be clean in the hole after it is drilled. Have your drill tapered or beveled so that when the heel of the bit is cutting, the point will be through the plate. File up sharp with a very fine file. The cutting edge should be sharp and smooth. If a coarse file is used it will leave a rough edge that will cut in soft iron well enough and in steel would crumble. Procure a block of lead, heat the drill to a cherry red and drive it into the lead, say half an inch, and then leave it to cool. If the steel is good, it will never be too soft and may sometimes be too hard. If too hard, don't try to draw the temper, as it will then be too soft on the cutting edge. Temper over and don't heat quite so hot, and you will soon learn what heat the steel will require. I have one that has drilled a great many holes and is sharp yet. Never use this drill on iron, as it will fly like glass, and there is as much to keep in mind in using a drill for this work as in tempering it. Always use a hardwood block under the plate to be drilled, and it should be one on which the saw will rest only when it is under the point of the drill. Never force the drill, and use plenty of oil. When the heel of the drill is about through, turn it and feed very cautiously, or you will break your drill or crack your plate if it is thin, and that crack will not be seen until the saw has been run some times.

I have had saws brought to me that had been drilled and had had a piece of brass or copper riveted in the drill hole. They cracked again farther down. Never plug a hole that has been drilled in a saw plate. I have never seen a saw crack below the drill hole, if drilled properly. When a saw is cracked, it is cracked further than the naked eye can see, so you must get the course of the crack and drill in that course, say one-half of an inch further down. Then your saw will never crack again unless it goes to pieces.

A NEW BRANCH OF IRON MANUFACTURE.—Mr. James Willing, a well-known English advertising agent, has made arrangements for the establishment of a factory in Philadelphia for the manufacture in that city of the well-known enameled iron sign plates and tablets, which have heretofore been imported from England, where alone the art of their manufacture is known. He will bring over skilled workmen with him. This new industry has assumed quite large proportions in England, and quite a good demand for these articles has sprung up in this country. They are also being extensively used on the continent and in India.

LIGHT AND HEAVY HAMMERING.—There is a difference in the driving effect of a light hammer when compared with the blows of a heavy one, or a rusty machine bolt would not remain to be riveted up all out of shape when a six pound sledge will take everything before it. The driving effect from any source seems to require time to act in order to extend a great way into the material. This is noticed in heading up a rivet, where the metal can be worked down into a cone-shaped head by the upsetting effects of a sharp blow, which will be crippled at once under the crushing force of a sledge-hammer.

HARD AND SOFT EMERY WHEELS.—Hard, close-grain emery-wheels do not cut so rapidly as soft, loose ones, from the fact that the particles in the hard stone are more compact, and the edges wear slightly before breaking, while in the soft wheel the cement wears first, and more rapidly, presenting new cutting edges to the work, which, when but slightly worn, will pull out of the wheel on account of this increased friction surface, fresh sharp edges replacing them. This is proved by the fact that the fastest-cutting wheels are the softest.

LOCOMOTIVES FOR SOUTH AMERICA.—H. K. Porter & Co., of Pittsburgh, are building a number of small plantation locomotives for South America, which are preferred to those made in France and England, and it is said that the bulk of the trade is coming to the United States. Shipments are being made to Venezuela and Ecuador. The water is carried in a tank over the boiler, and the cab is an open sheet-iron canopy.

THE BRONZE CASTING ever undertaken in America was accomplished successfully some days ago by the Henry Bonnard Bronze Company, of New York City, who are engaged upon the equestrian statue of Gen. Meade, for Philadelphia. The metal was 90 parts copper and 10 parts tin, weighing altogether 7500 pounds. The statue, when finished, will be 16 feet high and weigh about 10,000 pounds.

SCIENTIFIC PROGRESS.

A NEW THEORY OF BOILER EXPLOSIONS.—M. Hochereau, formerly a works manager in Belgium, has recently published a curious theory of what he calls fulminating explosions of steam boilers. He attempts to demonstrate that these fulminating explosions are to be attributed principally, if not exclusively, to the ignition by an electric spark of a mixture of air and more or less highly carburated gas produced in the boiler. For this it is necessary to establish three points: First, the possibility of an electric spark in the normal conditions of working boilers; secondly, the production of a more or less pure hydrocarbon gas; thirdly, the presence of the air necessary for the formation of an explosive mixture. As to the formation of an electric spark, it is known that electricity is generated from the friction of steam escaping from narrow orifices; and M. Hochereau says he has witnessed the appearance of sparks when steam has escaped from a crack in a plate. He declares also that if the steam escaping from the safety valve of a boiler is observed in the dark, under favorable conditions, an electric aureole of 0.20 or 0.30 meter in diameter may be perceived round the valve. The spark is also produced when the steam valve is opened, as well as at the opening of the slide valve of an engine. Then the presence of hydrogen, more or less carburated, is ascribed to the decomposition of organic matters, especially of a fatty nature, which find their way into the feed-water, particularly when condensed water is returned to the boiler. Finally, the necessary air is supposed to be derived from that dissolved in the water and given off when it is vaporized. It is a fanciful theory, and requires verification.

GAS AND ELECTRICITY.—Electricity has of late been making rapid strides toward becoming an important factor in the illumination of cities. So important has this new illuminating agent become, that the gas companies in New York and other large cities have, for some time, been considering the propriety of taking up the electric lighting business and uniting it with their gas interests, and thus operating them in unison—supplying either gas or electricity, as their patrons might prefer. Mr. J. R. Thompson, a well-known authority in everything pertaining to gas lighting, says, in reviewing the developments of 1886, that "there can be no doubt any longer that the gas fraternity of the United States have about made up their minds to embark in the electric-lighting business on joint account with gas supply, and there can be no possible ground for not believing that many of those who sanction the plan are eminently well qualified to pass a dispassionate, just and logical verdict in the premises. Summed up in a few words, these have their opinion on the fact that electric lighting has come with us to stay, and being with us as a permanency, the gas man can supply it more efficiently, and at the same time cheaper, than can be done by those who would seek to control it as an independent, or, rather, distinct branch of commercial and domestic service. This, then, can be set down as one of the revolutions effected in the sentiment of the artificial lighting business during 1886."

A ONE HUNDRED AND FORTY-FIVE HORSE-POWER WHALE.—Sir William Turner, the eminent professor of anatomy in the University of Edinburgh, recently delivered a lecture to the members of the Philosophical Institution of that city on "Whales, Their Structure and Habits," in the course of which he referred to a point of considerable interest to engineers, which was the horse-power exerted by the tail of a large whale. Regarding the length of full-grown whales, Professor Turner remarked that the Greenland right whale was from 50 to 60 feet long, and he said that the great fin whale, which frequently visited the British seas, reached the length of 80 feet, or even more. It had been estimated that the Greenland whale could attain a speed of 9 or 10 miles an hour, and that the fin whale attains even a greater speed. He had asked Mr. John Henderson, of Glasgow, the well-known builder of the Anchor liners, to assist him in arriving at the horse-power which must be exercised by one of these great whales so as to acquire a speed of 12 miles an hour, and he put the case of the Longidry whale before him. It was 80 feet long, weighed about 74 tons, and had a tail 18 to 20 feet across from the extreme ends of its flanges. With these data, Mr. Henderson calculated that a whale of the dimensions mentioned, in order to attain a speed of 12 miles an hour, would require to exercise a propelling force of 145-horse power.

THE SPHEROIDAL STATE OF WATER AS SEEN IN GLASS WORKS.—The spheroidal state of water has long formed a favorite object for experimentation by lecturers. It consists in protecting a liquid from contact with a hot surface, by interposing between the two a layer of gaseous molecules. In glass-works the spheroidal state of water is sometimes illustrated on a large scale. In making colored glass, such as ruby glass, in which gold is the base of the coloring agent, it is often necessary to remelt the charge. The pot of melted metal is emptied by ladling, and the melted glass is poured into water. A barrel of water is placed upon the floor near the opening of the pot, and the workman with an iron ladle pours the melted

glass into the water. It at once sinks, and, owing to its intense degree of heat, becomes surrounded by an atmosphere or thin layer of steam. The water does not touch it, and hence is but slightly heated. This surface remains quiet, and the depths of the water glow with a diffused red light. After awhile the glass cools, the water comes in contact with it, and hursts into rapid ebullition. Even this ebullition is less violent than would have been anticipated, owing to the non-conducting power of the glass. As soon as a small thickness becomes cool, it protects the center of the mass. If a few lades are emptied into a bucket of water, the effect is far more striking. The red-hot glass can be seen lying in a mass, as large as a cocoon, quietly at the bottom of the pail. It is most impressive to see the great lump of glowing glass maintaining its full heat under the comparatively cold water. This state of things may last for a minute or more before the water boils.

COAL IN EUROPE.—A German technical paper publishes some interesting statements regarding European coal fields still unexplored, and adds estimates of the probable duration of their supply. In Great Britain, the chief coal districts—Newcastle, South Wales, and the Clyde country—yield about 170,000,000 tons per year. Taking last year's consumption as representing the average annual consumption for many years to come, the journal estimates that the British coal mines will not be exhausted in less than from 600 to 800 years. In Germany the coal industry is more favored than in any other country in Europe. It is calculated that drawing upon only one of her fields—the Westphalian—Germany will not be able to exhaust her coal supply in less than a thousand years. She has, in addition, the riches of the Bavarian, the Aachen, and the Silesian coal districts. It is thus evident that Great Britain and Germany alone—to say nothing of France, Austria, Denmark, Russia, Sweden and Italy—are able to supply Europe with coal for a period which makes all speculation about the coming exhaustion of the coal supply, to say the least, highly premature. To suppose, moreover, that a thousand years hence the industrial operations of the world will be still depending upon the coal supply is to put even less faith in the resources and the future of science than would have been reposed in them by a man predicting in the days of primitive writing the inevitable exhaustion of bark.

DECOMPOSITION.—The more rapid the decomposition of a substance, the greater the smell or flavor thrown off, which, in either case, may be pleasant or disagreeable, according to the substance decomposing. There are vegetables that throw off a bad smell when decomposed by cooking, and still have a pleasant flavor when cooked. It makes no difference whether decomposition is brought about by fire or the lapse of time, the result is the same, only more or less intense. Flavor or smell is the gas of the decomposing substance. The blue vat is a method of decomposing indigo. The boiling of dyestuffs is a method of rapid decomposition, without which dyeing could not take place. The more rapid and perfect the decomposition, the better the color, and the quicker it is obtained. The smell thrown off from decomposing dyestuffs in steam contains no coloring matter whatever. It remains in the liquid until abstracted by the material being colored.—*Fabric and Fiber.*

THE LEAP OF THE SALMON.—The power that the salmon possesses of ascending waterfalls is the subject of some interesting details by Prof. A. Landmark, director-in-chief of the Norwegian fisheries. He states that in certain cases salmon have been observed to ascend to a distance of 16 feet, and he feels this to be true from having seen them leap over two masts which were three and a half feet apart, and which had been placed across the river at about 16 feet above the water, at Hollofoss, upon the Drams, at Haugsend. He says, even, that certain salmon, on ascending a vertical fall, are capable, if they meet the fall at right angles with the muzzle, of remaining a minute or two in the midst of the mass of falling water, if they do not succeed in passing over the fall at a single leap.

THE AGE OF FISHES.—Professor Baird says that as a fish has no maturity there is nothing to prevent it from living indefinitely and growing continually. He cites in proof a pike living in Russia whose age dated back to the 15th century. In the Royal aquarium at St. Petersburg there are fish that have been there 140 years. He asserts that carp have been known to attain the age of 200 years. Goldfish have been known to live 50 years. Probably some people will doubt what is said by Professor Baird about the age a fish can attain. If they doubt, they are simply doubting the best known authority on fish.

ARTESIAN WATER PRESSURE.—Sometimes the pressure of an artesian flow of water results from a gas pressure instead of from a high head of water. Dakota has several artesian wells, 1000 feet deep, with 250 to 280 pounds pressure; but there are no high places very near to give this head of water.

A STRONG solution of alum water applied several times a day will remove warts from animals.

ENGINEERING NOTES.

Progress of Electric Lighting.

When the last census was taken, to wit, in 1880, the census man did not consider the electric-lighting investment of sufficient importance to warrant him in collecting the data. Capital was at that time in a condition which might be called undecided, so far as the electric-lighting field was concerned. The great promise that had been made for electric lighting by ill advised persons had not then been realized, and the difficulties in the way—difficulties which, it should be said, always array themselves in the path of novel enterprises—seemed to present an insuperable barrier to the development which, at that time, was thoughtlessly promised and is now being realized. We say thoughtlessly promised, because, while such development was not an impossibility in the future, the claims that were made of immediate profits were absurd, and investors unfamiliar with the field and its possibilities, who had been encouraged by these rash promises to come in, were soon stampeded.

But there were men with brains, as well as capital, in the electric-light business. It was enough for them that the prospects were bright, without the expectation of getting an immediate profit. The demand for the light increased as the apparatus for its distribution was perfected, and as improvement was constant, the business grew. At first, as we have said, it was slow, then faster, until finally it sprang into public favor at a bound, and is now recognized as one of the best-paying industries. We say that its rise and progress have been phenomenal, and if any one doubts it we would refer the doubter to the fact that investments in electric lighting and the manufacture of its accessories have, in only six years, advanced from nothing to \$92,000,000, while the value of electric-light patents is estimated at \$15,000,000.

From 1881 to 1882 the business of supplying electric light almost doubled, and has doubled year by year ever since. It cannot, of course, go on at such a rate as this much longer, for the doubling process, if continued, mounts soon to infinity. There are over 650 local electric-lighting companies in the country to-day. At least 125,000 voltaic arc lights are now lighted nightly. There are also about 640,000 incandescent lamps aglow to-day in the United States.

The question as to electric-lighting popularity has always been one of economy. No one ever doubted that electric lighting would be popular, but many did doubt if it would ever be cheap enough to be generally used. Happily, the cost of distribution, the cost of apparatus and of lamps, has become less and less yearly, indeed, we were about to say monthly, for those who are watching the movement have been surprised to see how quickly one improvement has to give way to another. To-day, the cost of an electric-lighting plant is less than one-half what it was six years ago, and there is every reason to believe that six years from now almost an equal decrease in cost will have been attained. We condense the above from the *Electrical Review*.

CROSSING THE ATLANTIC IN FOUR DAYS.—The project of crossing the Atlantic in four days is being carried out in earnest. The first steamer to accomplish this is already commenced, and 11 others of the same calculated speed will be launched as fast as they can be built. The models and drawings for these fast steamers are said to be quite unique, but promising in appearance, and the chief engineer, Robert M. Foyer, is quite confident that the proposed speed will be fully attained. The first one, the *Pocahontas*, instead of being built on lateral lines, will be built upon 68 transverse steel walls or bulkheads, $7\frac{1}{2}$ feet apart. These walls will have openings cut in them for the saloons, passageways, tunnels, etc., with vertical longitudinal walls through them, thus making 1060 water-tight compartments. She will be provided with compound engines of 27,956-horse power, capable of giving a speed of 22 knots an hour. There will be 20 boilers to furnish steam for the main engines, with three smoke-pipes on each side of the ship next to the rail. What effect heavy seas will have on the smoke pipes thus arranged remains to be seen. Her dimensions are to be 540 feet in length, 40 feet beam, and draft of water 25 $\frac{1}{2}$ feet.

INCREASING THE FRICTION.—The system of throwing sand on the rails in front of the driving-wheels, by a jet of compressed air or steam, has been found very successful on the Midland railroad (England), and that company is about to extend its use, and is building ten engines with a single pair of drivers in place of the four-coupled engines used on this road for many years past. The jet of sand will, it is expected from the results of experiments, be found to give sufficient adhesion. The cost of coupling rods and the large pair of hind drivers will thus be saved. The system, as applied to an ordinary American-type engine, is also to be tried on a prominent road in this country.

THE PROPOSED BRIDGE over the Straits of Messina, which separate Sicily from Italy, will, when consummated, form one of the most striking feats of modern engineering. The place selected is where the channel is 2 $\frac{1}{2}$ miles wide and 361 feet deep. Two piers will support the viaduct of steel rail at the dizzy height of 328 feet above the water!

USEFUL INFORMATION.

HOW TO MAKE GLAZING OR HOUSE PAINTERS' PUTTY.—In carriage-painting we use a putty that for glazing glass is worthless, as it will not stick to the glass after it has dried with any degree of tenacity, especially so in window-glazing. And as it often happens that the painter (especially when working in the country, where house-painters are not so plentiful) is called upon to put a new pane in a window, it may be well to instruct some who are probably ignorant of the formula for mixing glazing putty suitable for the purpose. House-painters' putty proper is nothing but whiting and oil mixed together, with sometimes a little japan or sugar-of-lead thrown in to harden it more quickly. Take the whiting, add the oil until you can work it with the hands; do not get it too dry. After you have kneaded it so that the oil has been absorbed by the whiting to work it soft enough for easy use, pick it up in the lump and throw it down heavily on the stone until you get it to suit you. Our regular trade putty, in which white keg lead is used, always gets hard and tough when worked too much, whereas the oil and whiting putty gets softer and softer as you work it.—*The Carriage Monthly*.

DOES FROST WEAKEN RAILS?—"No," said Chief Engineer Hoyt, of the Rochester & Pittsburg railroad, recently, "the low temperature does not decrease the strength of the rails, as is commonly supposed. But accidents are more likely to occur from broken rails in cold weather. The reason is that the ground when frozen solid is rigid and loses the elasticity that acts as a safeguard in fine weather. When a train runs on such a road-bed something must yield, and as the rail is the weakest point it gives way. I was laying a track in Illinois some years ago over the prairie, and trains ran on it for months without breaking a rail, but a severe frost came that disturbed the sleepers, lifting some of them and causing an unequal distribution of weight. Immediately afterward we began to hear of broken rails at numerous points. Extended experiments have been made with testing machines on steel and iron rails, and we find that the cold does not weaken the metal at all. The frost is also likely to diminish the safety of bridges by causing the metal to contract and produce an unequal strain on the trusses, etc."—*Rochester Post-Express*.

TO LAQUER AND OXIDIZE BRASS.—Muratic acid and arsenic in the proportion of one ounce of acid to two ounces of arsenic (arsenous acid) will blacken brass. Lacquer of all kinds are made by dissolving shellac in alcohol or wood spirit. As good a method for a beginner is to keep adding shellac to a sufficient quantity of alcohol until the varnish is as thick as you think you need. As a rule, beginners make their lacquer too thick; about one ounce of shellac to 10 or 12 of alcohol is about right. To this shellac varnish is added various coloring matters, soluble in alcohol, to give to the lacquer a golden color. These colors used to be obtained with dragon's blood, aloes and gamboge; but recently aniline colors, such as are sold as poor man's dyes, diamond dyes, etc., afford all shades of yellow and red. These added to the plain shellac varnish will give all the imaginable gold, red gold and coppery hues one can desire. All work to be lacquered should be warmed, and the lacquer applied with a soft camel's hair brush; several coats can be applied.—*Ex.*

A UNIQUE STRUCTURE.—The main building now being constructed on the grounds of the American Exhibition of the Arts, Inventions, Manufactures, Resources and Products of the United States, at Earl's Court, Kensington, London, is entirely unique, and will in itself be a most interesting exhibit. The entire framework of the structure is composed of steel rails, such as are used in constructing railways. Two of these, bolted back to back, with the T side out, make a very strong and really ornamental column. The only casting required is an angle iron and eyebolt, into which the ends of the rails are slipped. This frame will then be covered with plates of glass and sheets of corrugated iron. The advantages are many. For rapidity of construction it is unequalled, as an acre a week can be easily put up; and it has also the advantage of economy, no skilled labor being required to put it up or take it down, and finished with the material is as good and marketable as when first purchased.

RAT COLONIES—A NEW INDUSTRY.—Why not? "The rat skin is said to be finer and stouter, and will bleach whiter and lose none of its strength more readily, than any other substitute for real skin, and why not the preparation of rat colonies, where, properly caged, housed, guarded, fed and cared for, the rat may be allowed to multiply and furnish fine skins for fine products?" So asks a correspondent, and we say, why not?

CHEAP METHOD OF PLATINIZING METALS.—In this new process, the metallic object is covered with a mixture of borate of lead, oxide of copper, and epirite of turpentine, and submitted to a temperature of from 250° to 330°. This deposit, upon melting, spreads in a uniform layer over the object. Then a second coat is laid on, consisting of borate of lead, oxide of

copper, and oil of lavender. Next, by means of a brush, the object is covered with a solution of chloride of platinum, which is finally evaporated at a temperature of not more than 200°. The platinum adheres firmly to the surface, and exhibits a brilliant aspect. If the deposit be made upon the first coat, the platinum will have a dead appearance. Platinizing in this way costs, it is said, about one-tenth the price of nickel plating.—*Le Genie Civil*.

THE SHRINKAGE OF FLANNEL.—To keep flannels so much as possible from shrinking and felting, the following is to be recommended: Dissolve one ounce of potash in a bucket of water, and leave the fabric in it for 12 hours. Next warm the water, with the fabric in it, and wash without rubbing, also draw through repeatedly. Next immerse the flannel in another liquid containing one spoonful of wheat flour to one bucket of water, and wash in a similar manner. Thus treated, the flannel becomes nice and clean, has barely shrunk, and almost not at all felted.

DIMINISHED COST OF PRODUCTION.—A gross of steel pens, which formerly cost \$35, may now be produced for eight cents. The cost of making gold chains has been reduced to one-eighth of what it formerly was. These illustrations are but two of many which might be adduced to show the diminished cost of production brought about by improved machinery in metal work.

KNIFE-SHARPENING.—To hone a jack-knife, raise the blade on the back from the bone. It takes the polish off to lay the blade down flat and leaves too thin an edge to stand the hard usage required. The delicate polish that the hone will not imitate is "set" with walrus-hide wheel fed with rottenstone.

QUINCE CIDER.—A very pleasant beverage can be produced as follows: Take a quantity of ripe quinces, cut into quarters, and with the pips, etc., removed. Boil these in a copper with double their weight of water; when boiled to perfect softness, pour the must into a vat.

SEWING MACHINES.—During 1886 there were made and sold in the United States \$17,000 sewing machines. Of these, 647,000 were sold at home and 170,000 abroad. The machines exported brought \$2,190,809, and they went to every country on earth.

NITRATE OF SILVER STAINS.—Dip the fingers into a strong solution of cupric chloride. In about a minute the silver will be converted into a chloride, and may then be washed off with hyposulphate of soda solution.

GOOD HEALTH.

The Cancer Discussion.

EDITORS PRESS:—I observe that you have recently commenced the publication of a series of articles and letters relative to the cure of cancer. Having the most valid reason for gratitude toward this minister of medical skill and beneficence, I hail your articles upon the disease in question with the most lively interest. Some seven years since my wife was afflicted with a supposed cancer upon the face. Two eminent physicians were consulted. Both pronounced it a case of well-defined cancer. One recommended immediate and vigorous treatment. That treatment was to pierce the tumor at its roots with a silver wire, afterward to be heated to a white heat. Disorganization and cure it was said would result. Although then believing this to be more rational than the knife, I hesitated. During my hesitation I accidentally met with an acquaintance whom the practitioner, referred to in your journal, had a short time previously cured of a cancerous tumor upon the neck—a tumor which had twice been removed by the knife of one of our most distinguished surgeons. This was decisive. I at once applied to the specialist of your reference and was promised a cure. That cure was most eminently effected, scarcely leaving the trace of a scar. The disease has never returned, and I have no fear that it ever will. Therefore, from my own experience and a knowledge of the experience of many others under this same treatment, together with that of the history of cancer cure under the operation of the accepted specifics of the medical schools, I believe that a great discovery has here been made in therapeutics as applied to this special disease—a discovery that is destined to mark a new era in the progress of medical science.

The philosophy of this new treatment, as well as its results, bear me out in this declaration. If the scirrhus tumor or ulcer is but the symptom of a diseased blood, is it not more rational to restore the blood to a healthy condition, as one of the chief requisites, than it is to assault the simple symptom with the knife or other violent means? Upon the properties of the blood depend all the conditions of the system. Why, then, neglect this vital element, involving as it does the life and death of the subject in the cure of cancerous difficulties, as well as in other cases? To do so seems to be a plain violation not only of sound philosophy, but of common sense. Hence the knife as a specific for cancer ought, it seems to me, to be abandoned by every medical practitioner who lays the least claim to reason, conscience, or to humane instinct. Under the new treatment,

the symptom not only becomes a point of attack, but the blood wherein ebbs and flows and intensifies the cancerous virus. Therefore, the symptom and the disease here become subjects of assault at one and the same time. If the poison in the blood becomes neutralized, from what source, then, has the tumor to draw its vitality? None! Is the ready answer of the commonest mind. With this then accomplished, health is a consequent follower in all cases where the cancer has not been allowed to pass to its final stages.

But of what immediate avail is all this attempt at reasoning? Unfortunately for the layman, he is the helpless subject of professional dogmas—egotism and obstinacy. Unfortunately for science, professional stupidity and jealousy crucify the Harveys and the Jenners. But like the truths of vaccination and of the circulation of the blood, the discovery in question for the cure of scirrhus tumors is sooner or later to become the great and accepted remedy with every medical practitioner throughout the civilized world.

The medical schools fought both Harvey and Jenner for 25 years in the promulgation of their theories. But truth vanquished the schools, and Harvey and Jenner became immortal. So, in the case under discussion, the medical faculty of San Francisco seem to be too dogmatic, jealous and obstinate in their treatment of the new theory of cancer cure and its advocates; but they are obstinately confronting a great truth—one that is as sure to overwhelm them in the fullness of time as did the truths of vaccination and of the blood circulation overwhelm their fossilized opponents. We will not pretend to state that the now seemingly obscure discoverer of the grand specific under consideration will pass into popular history; but this we will state: that as many do now, so shall many more in the future, if Divine Providence permits, write the name of this discoverer on tablets more enduring than those of manuscript or of marble. W. H. BARTON.

PROTECTION OF THE EARS UNDER CANNON FIRING.—Dr. Samuel Sexton, of New York, says: It is the experience of many officers that the vibrations of great intensity which are given off from some field-pieces and bursting shells, charged with high explosives, are more disagreeable than the heavier sounds of great guns. The metal itself vibrates under these circumstances similarly to a tuning-fork. A very disagreeable jar is imparted to the temporomaxillary articulation when the individual is near a great gun being fired off. This is lessened, it is believed, by standing on the toes and leaning forward. Some simple precaution to be employed by officers and men during artillery practice would seem very much needed, since aural shock is not only painful and distressing, but orders cannot be well heard while the confusion lasts. There is probably no better protection than a firm wad of cotton wool well advanced into the external auditory canal. In suggesting this protection, it is believed that harm can seldom take place from pressure of air from within, since it is known that the violent introduction of air into the tympanum from the throat, by means of Politzer's method of inflation, seldom ruptures the drum-head, though if such a volume of air were suddenly driven into the external auditory canal, the drum-head would, in nearly all cases, be ruptured.

INFLUENCE OF EARTHQUAKES ON THE HUMAN SYSTEM.—A very interesting communication to the *Medical News* has been made by Dr. F. Peyre Porcher, of Charleston, on the influence of the recent earthquake shocks in that city upon the health of the inhabitants. In addition to the natural alarm and fright which were quite universal, some persons were attacked with nausea and vomiting, which recurred or persisted in several cases for days. Two gentlemen on the islands, 80 miles from Charleston, had their eyes filled with tears not to be repressed, but not caused by alarm or fears for their personal safety, for the danger there was not imminent. Many persons experienced decidedly electrical disturbances, which were repeated upon the successive recurrence of the shocks. These were generally tingling, pricking sensations, like "needles and pins," affecting the lower extremities. One gentleman was completely relieved of his rheumatism; another, who for months was nervous, depressed and entirely unable to attend to business, regained his former activity and energy. Several cases of mental disturbance, owing to anxiety and prolonged loss of rest, some of them persistent, occurred among Dr. Porcher's patients.

SUBSTANCES IN THE EYE.—Everybody has experienced the pain and annoyance of "something getting into the eye." What should be done when this happens? In the majority of cases, if the sufferer has the patience to close the eye gently, and keep it immovably closed for from five minutes to a quarter of an hour, the offending particle will be easily and painlessly washed away by the tears which the eye will naturally shed.

CURE FOR BILIOUSNESS.—For biliousness the editor of the *Boston Medical and Surgical Journal* says a plain diet of bread, milk, oatmeal, vegetables and fruit, with lean meat and fresh fish, is best. Exercise in the open air. The victim of an acute attack will be righted by (1) abstinence; (2) porridge and milk; (3) toast, a little meat and fish and ripe fruit, thus coming to solid food gradually.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, April 2: Everything about the Wildman is running smoothly. The hydraulic pump of Knight & Co. was at first placed under water entirely, but in that position did not give the results anticipated. After being raised about six feet above the water level its working was satisfactory in every way. Knight & Co. have sent a force of men to the Lambing gravel claim near Lone, to erect the new derrick which the firm has been constructing for some time. The job will take three months to complete. The Amador Canal Co. is doing some extensive repairs to the flume in the neighborhood of Bald Rock, about 18 miles above here.

MAHONEY.—Amador Dispatch, April 2: The Mahoney mine has not as yet been sold, nor is there much prospect of the present owners disposing of the same, as they cannot come to the Eastern capitalists' terms. Work on the surface ground is still continuing, and they are running the 40 stamps with encouraging prospects. It has been rumored that the owners of the Iowa mine have struck a good streak of ore which knowing ones say will yield well. They are working eight or ten men and are running ten stamps night and day.

Butte.

WORK RESUMED.—Oroville Mercury, April 1: The Cherokee mines resumed operations this morning. The Bank of California having agreed to the proposition made by the miners. Wm. Gregory is superintendent, and Jas. Doyle, John Tubey, and Jas. Donovan are section bosses. The men will now be paid monthly, and the surplus, after paying the running expenses of the mine, will be devoted to the back pay of the men.

Calaveras.

THE STICKLE.—Mountain Echo, April 1: We visited the Stickle mine the other day, and have not the slightest hesitation in saying that, taken all in all, it has the best running mill we have yet seen. We have from time to time visited and examined the principal quartz-mills of this county and have found none equal to the Stickle. It runs as smoothly as clockwork, and there is scarcely any jar perceptible. There are 20 stamps, having a 7-inch drop, each of which has a crushing capacity of 3 tons in 24 hours. A 60 screen is used, which, the superintendent informed us, is much better than larger sized ones. The facilities for saving the gold are unsurpassed, at least in this section. Under the present management the Stickle mine is yielding a handsome dividend.

El Dorado.

SOLD.—Placerville Observer, April 4: Ex-Sheriff T. A. Galt & Co. have sold the Independence mine, located two miles southwest of town, to R. S. Raw & Co., for a snug sum. This mine was once known as the Wilder mine, and bids fair to become one of the leading mines of this section. The tunnel started by Stone & Burdick, first 100 feet let by contract running due west from Martinez creek. Also a new location known as the La Panta mine. Shaft down 15 feet, showing two feet of fine ore. Will sink 100 feet or more. La Panta and other veins will be cut by the tunnel which will be run continuously till the La Panta is reached, which will be about 1000 feet, cutting the vein 800 feet in depth. A mill will be erected as soon as the developments will warrant.

Add Utah.

PARK NOTES.—Record, April 2: The Southern Tier Company reports a new strike in the west shaft of the No. 2 tunnel. The ore is very rich and averages from one to two feet thick. The ore shipments from this property from now on will largely exceed all previous records.

CAMP CROSSCUTS.—The 130th regular dividend of the Ontario Mining Company was paid on the 1st inst., aggregating \$75,000, or 50 cents a share. The total of dividends to date is \$8,150,000, and stock is quoted at about \$25 per share. Work is still going ahead at a lively rate on the Whitehead group in Blue Ledge district, and the prospects of something big being unearthed in the near future are very encouraging. Extensive operations on the Story group, just above No. 3 shaft of the Ontario, have been planned for the coming season. Development work on some of the properties on Treasure hill, just west of town, has already begun, and several of the owners declare that great activity will be witnessed up there this summer. Shipments of Crescent concentrates will soon be resumed, and the record this year ought to far surpass any previous year's work. The rapidly disappearing snow is causing prospectors to have their picks sharpened and shovels polished up, preparatory to starting out into the hills. Owing to the bad roads the Crescent shipped no ore last week, and for the same reason the Mackintosh sampler has not received any Ontario or Dairy ore the past two weeks.

Mariposa.

HITE MINE.—Mariposa Gazette, March 26: The Hite mine, which belongs to the management of Judge Walker, is giving employment to 50 men and is running 20 stamps and crushing ore, paying \$40 per ton, with a bright prospect in the mine of there being an abundance of ore of the same character. Hite's Cove is rapidly looming up. Other mines in the Cove that have lain dormant for some time are being looked after. The South Hite has been sold or bonded, and G. W. Barley, who has been stuck to the Cove through the dark days, is developing one of the best mines in that vicinity with a fair prospect of reward for his labor and tenacity in holding on for a better day.

THE BUENA VISTA. under the management of Mr. San Pedro, is giving employment to 40 men. The new machinery is about placed in position, and a large quantity of ore is being piled ready for crushing. It will be but a short time before the sound of the steam-whistle and the roaring of the stamps crushing ore will be heard for miles around.

THE DILTZ MINE.—This mine has been leased for the rainy season, while water can be had for sluicing and hydraulicking, to Joe Schantz and Sam Jacoby, two well-known, industrious miners of that

section. Captain Diltz was anxious to have removed from off his mine of quartz rock a large landslide, which can only be done in the rainy season, while there is water to fill his ditches and reservoirs; hence the lease to Schantz & Jacoby. Although the rainy season has given them but about a week or ten days' wash, they have picked up considerable gold independent of the sluices.

Mono.

BENTON.—Inyo Register, April 1: J. O. Wheeler came down from Benton this week, and says there is considerable work being done on the hill, and with good results. J. F. Miller has a large lot of ore on hand, and will soon commence crushing. Cal Joy has some 9 or 10 tons of high grade ready for shipment. He has a lease of the Tucker & Mitchell property. James McClure has a lease of the famous Comanche mine, which promises well. W. T. Redd is shipping ore. John Kremkow is working ten men on the Kearsarge. J. O. Wheeler is preparing to ship ore from Montgomery. Benton is entitled to a boom, and every one who knows the history of the place believes it will come some day.

MORNING STAR.—Silver City Avalanche, April 2: Since it is almost certain that the Morning Star mine is to be opened up in good shape, it is equally sure that a rich body of ore will be found. Some of the richest gold and silver ore ever seen in this camp came from this mine. It is hardly probable that it has all been extracted, and there is no reason why this should not be a dividend-paying mine.

Nevada.

BONDED.—Foothill Tidings, March 30: Messrs. George Fletcher, Dr. I. W. Hayes and Waldo Waggoner have bonded the Cedar mine, owned by J. R. Nickerson, and situated on the ranch of the latter, some 10 or 12 miles south of Grass Valley. The gentlemen who have bonded the mine propose to interest capital in the venture and will soon commence the work of development. This ledge was discovered many years ago and frequent assays have yielded high values. The situation of the vein and the financial inability of the owner have so far prevented the working of the mine. The ledge is probably the largest in the county, being from 20 to 30 feet wide on the surface. Some specimens of ore from the ledge have been brought to town and show well in free gold. Several boxes of very rich rock—specimens in fact—were taken out of the Crown Point mine last night. The rock came from the north drift of the 300 (bottom) level, and from the bottom of the level at that. The ledge at this point is strong and the average rock therefrom is said to pay well. The Crown Point has our permission to keep up its lick. Another batch of specimens was taken out of the Nevada County mine, Nevada City, yesterday.

COE MINE.—Grass Valley Union, April 3: A. W. Stoddart, lessee of the Coe mine, will soon commence the erection of pumping and hoisting works, and the introduction of water-power to the same, and expects within six weeks to be ready to commence pumping out the mine.

GOLD POINT MINE.—The Gold Point mine near Union hill, upon which operations have been quietly conducted for several years, is opening up encouragingly, and there is a strong vein which is now of good milling quality. The vein is opened upon by a tunnel from the bank of Wolf creek, and has reached a distance of 1400 feet, with a perpendicular depth of 164 feet, and the backs about 200 feet. The ledge has a varying width of from two to five feet, and therefore there is a large amount of quartz that is now available for crushing. The company has it in contemplation to put up a mill this season, and has had offers for that purpose which are being considered. The Gold Point Company has expended a good deal of money in the work that has been done, and no effort has been made to float stock, which has been held in but few hands, who have had big faith in the mine becoming one of the important mining properties of the district.

THE BRUNSWICK MINE.—A dispatch from New York says the shares of the Brunswick mine are being rapidly taken up. The Brunswick is in this district (formerly known as the East Eureka) and has upon it a good 20-stamp mill, and hoisting and pumping works, and has been worked several hundred feet in depth, showing a well-defined ledge. The mine is regarded as a valuable one, if properly developed, and for this purpose the new company was formed to raise a working capital. With this accomplished, the work of reopening the mine will be commenced. Mr. George Fletcher, auditor of the Narrow Gauge Railroad Company, will be the resident director and manager.

RICH.—North San Juan Times, April 2: The mine in Grizzly canyon located by J. G. Hall, and now claimed by J. P. Clark, is supposed to be very rich. We hope it will prove so, as it is but a few miles from this place. The Delhi mine is booming. About 16 tons of rock is being crushed at that mine daily, and it is of the richest sort. The owners of the mine are satisfied with their success, and when they are satisfied nobody else has a right to complain. The Delhi bids fair to become a bonanza—a second Idaho. The Boss mine is showing up first-rate. The shaft is down about 100 feet, and the rock taken from the bottom is said to be very rich. The workmen are now crosscutting to find the walls. The owners of this mine are highly elated over their prospects. The owners of the Grant mine, most of whom reside here, are making extensive preparations for the construction of a mill at the mine in the near future. They have prospected the mine sufficiently to satisfy them that the rock is rich in glittering "ore," and that it will warrant them to expend money to a considerable amount to develop the mine.

OSCEOLA MINE.—James Huntress is working the old Osceola ledge near Rough and Ready. That ledge was famous way back in 1855, when it turned out some quartz which melted about \$225 a ton. But the Osceola was called a "pocket ledge" by the wise men of the early day, and when the ore got to milling as low as \$70 a ton work was stopped, but once in awhile hunting for pockets was done. Mr. Huntress is now putting the mine into shape. He is running up a deeper cut which will make the ledge dry to a much larger extent than it now is, and he expects to find some of those old pockets which were so rich. He washed off the old dump left by the early workers and in the pile he found some good lumps of gold, one of the chunks weighing about eight ounces. Mr. Huntress is fixing to get

water-power on the mine, and we hope he will find pay enough to make him a rich man.

ALTA CALIFORNIA GRAVEL MINE.—Foothill Tidings, March 31: The mine of the above name is situated at Bunker Hill, southeast of Randolph Flat, in Rough and Ready township. The owners are principally Grass Valley and Rough and Ready men, and they have been operating the mine for some four years. The quality of the gravel has been improving for several months and that now being taken out is considered to be first-class, and a cleanup will no doubt justify this judgment and prove the gravel to be remunerative. The lead is 20 feet in width and is worked by the drift process. It is supposed by many that this is the old Alta hill lead, and in that case the owners will soon be wealthy. The mine is especially well situated for developing.

SPECIMENS.—Foothill Tidings, April 4: At about 11:30 o'clock this morning, at the Crown Point mine, three candle-boxes of gold quartz specimens were brought to surface. The estimated value of this ore is \$5000. The rock came from the north drift of the 300-foot level—the same point from which specimens were recently taken. The rock brought up to-day is very rich with gold. One piece about 15 inches long by eight inches wide, and six inches in thickness, has three layers of solid gold running clear through it. The intervening rock is liberally sprinkled with galena and sulphurets mixed with gold. It is the best strike yet made in the mine.

San Bernardino.

WAGES.—Calico Print, April 4: The superintendent of the work of grading the foundation to the new 60-stamp-mill has a difficult time keeping his laborers. The wages paid is \$2.50 per day, and only miners who are "dead broke" will work for such wages, and then only a few days. Some of those who have quit work complain that the food at the company's boarding-house is not satisfactory for the wants of a workingman. Last Monday there were only three or four miners left out of the 30 employed, so the superintendent sent to San Bernardino for farm hands who are more accustomed to work for low wages than miners are. Bob Greer and Jas. Blair recently secured a lease on the Homestead mine, owned by William and John Reed. This mine lies between the Kearsarge and Silver Odessa, and has already a 60-foot shaft and a roof-tunnel worked on the same. The ore being of a low grade, work was discontinued by the Reed brothers. But Greer & Blair were fortunate enough to strike it rich from the grass roots. They are now taking out some fine ore and are much pleased with the prospect. N. Nelson and Joe Sutton have struck a rich pocket on the Bismarck which is panning out about \$20 a day. Nickless & Marlow and several other chloriders are still doing well on this old mine, which has yielded many thousands of dollars to the companies and chloriders who have worked it. Col. E. Birch and Geo. Tait recently obtained a lease on the Pinto near the Comet and commenced to take out ore from the first stroke of the pick. They have a good prospect. The Comet mine is still proving a regular bonanza to the chloriders working on it. Whitten, Boyle, Corcoran and others have realized handsome dividends from their labors, and still are taking out considerable rich ore. A 150-foot tunnel is being started to tap the main shaft at a depth of 70 feet. The leaching works on the Humburg and Bismarck mines are being operated successfully and yielding a fair profit to the owners. The force of men employed by J. S. Doe & Co. has been considerably increased, and now consists of 90 men, including those working at the mill. Ten tons of ore were shipped to the Selby Smelting Works of San Francisco from the Cleveland mine the other day.

Shasta.

LOWER SPRINGS DISTRICT.—Cor. Redding Free Press, April 2: In the immediate neighborhood of Redding, especially in this district, there are numerous ledges and deposits of what is termed low-grade ore; that is, ore that will mill from \$10 to \$40 a ton. These ores are largely sulphurets, but most of them will average from 10 to 30 per cent free gold; some of the ore may be called free-milling, especially near the surface. These valuable deposits of mineral have remained until quite recently unnoticed. About two years since, however, the attention of miners began to be attracted to the same, and since then prospecting has been carried on with such success that there are now two mills in operation, and a third is in course of erection, besides the reduction works and the De Forest plant in Redding. In fact the mining industry in this vicinity has already assumed a healthy and business-like appearance. With reference to the Lower Springs district in particular: The Muchmore mine has one of the finest 10-stamp mills in this part of the country now steadily at work on rich ore. This has every indication of being a very valuable mine and fortunate investment for the owners. The Eureka mine lies just over the hill, west of the Muchmore; the enterprising owners of this mine have a tunnel 140 feet in on the ledge, with fine ore in sight and flattering prospects ahead. The Copeland mine, about a half-mile west of the Eureka, has a good five-foot vein, with ore that mills \$10 per ton from the top of the ledge just under the grass roots. The El Dorado mine, about one-fourth mile west of the Copeland, has a ledge not less than six feet in width; the owners of this mine have a shaft about 30 feet deep on the vein with splendid ore; this promises to be a very valuable lead indeed. The Tiger mine, on Salt creek, just west of the mill, has an eight-foot vein of remarkably fine sulphuretted ore; the owners of this mine have 50 tons of ore on the dump ready for the mill. There are several other good mines in this district. The Lower Springs Mining and Milling Co. has a magnificent furnace of 15 tons capacity, and its new roller mill is now successfully at work crushing ore. When these works are fully completed, they will undoubtedly do first-class work. Messrs. Atkins and associates have the ground graded for their new stamp-mill, situated at the junction of the Shasta and the old Anderson road, on the site of the old Four-mile house, and the boarding-house erected, and are vigorously pushing their work forward. This mill is intended for custom work, which is a step in the right direction.

FLAT CREEK MINES.—Redding Free Press, April 2: Flat Creek district is attracting considerable attention. M. W. Sill, we hear, has purchased the Jacob of Spades mine, in the Flat Creek district, the price being \$2000. Jack Conant has put two men to work, on Spring creek, on a ledge just above

Murray's old boarding-house. Other properties in Flat creek are obtaining notice, and prospectors are overrunning the hills in such numbers as to almost impede locomotion. Mr. Sill has bonds on the following valuable properties in the Flat Creek district: The Black Rock, Red Rock, and the May Queen mines. He also had a verbal agreement with Samuel Broomfield as to the price at which he can take Broomfield's Great Eastern and his water-ditch from Spring creek leading to the May Queen, Red Rock, and Great Eastern. These are among the best properties in the district, and will undoubtedly prove great mines.

BULLYCHOOP.—J. Q. Finch, who was in town yesterday, accompanied by Ed. Aldersley, of Anderson, informs us that the Cumberland group of mines, owned by Foster & Cornwall, are being worked successfully, keeping a ten-stamp running night and day, and they intend putting in another ten stamps as soon as their sawmill is completed. W. K. Springer, of Chico, is putting up the latter; capacity, 10,000 feet per day. The Davis boys have bonded the Poundcake mine to an English company for \$40,000. Machinery is on the road for the Bullychoop mine. Prospectors are working on the Governor Butler, Oriental, Caucasian and other small mines.

Sierra.

PETERSON GRAVEL CLAIM.—Tribune, April 1: Wm. Swan has commenced extensive operations on the Peterson gravel claim. This claim is situated at Loganville and is said to be a promising one. Mr. Swan has two men at work.

Trinity.

A GOOD LEDGE.—Journal, April 2: Jas. E. Given returned from the East Fork district last Tuesday with about 10 pounds of rock from the Golden Chest, which he sent to San Francisco to be assayed. A specimen shown us was very rich, having plenty of free gold. A previous lot of rock from the same ledge assayed \$271.37 to the ton. The mine is owned by Messrs. Day, Given, Hubbard and Healy, and bids fair to develop into a valuable property. A tunnel has been run in tapping the ledge at a depth of 65 feet, where the vein was found to be 22 inches in thickness and between well-defined walls of porphyry and slate. Active operations will be resumed on the ledge in about two weeks, as the snow will be off by that time.

THE MINERSVILLE BONANZA.—From Mr. Newton Tourtlotte, who was in town this week, we learn a new strike in quartz has been made at Minersville. In running a tunnel to drain the shaft from which such rich rock was taken last fall a new seam was found which proved to be very rich—100 pounds of the rock paying \$100. The rock is much harder than the ore previously found, and new means of crushing the quartz will have to be employed. An arastra or a mill will soon be used in extracting the gold.

NEVADA.

Washoe District.

SAVAGE.—Virginia Enterprise, April 2: On the 1200 level the north drift continues in the same favorable quartz body of which mention was made last week. The drift, in passing along it, has cut into it a foot or two all the way, and for a distance of 140 feet shows ore. No. 3 west crosscut has been started at a point 80 feet north of No. 2 crosscut, and is out 15 feet. It is in quartz carrying ore that yields fair assays. The indications are excellent for getting a big body of ore at this point. The body of quartz is large and the quartz very coarse and strong. On the 600 level they are raising to connect with the 500 level. The upraise has attained a height of 45 feet. It continues in excellent ore. On the 800 level they are driving south in a very strong body of quartz, carrying spots of rich ore. The east crosscut on this level is all the way in the same quartz, which here also shows spots of good ore.

HAYWOOD.—Are stopping out from a point in the incline, 75 feet below the tunnel level. At the 200 level, an east crosscut is being run toward the hanging-wall. It is out 35 feet, all in good ore. This ore shows much improvement over that found at points above. Great breadths of ore have been opened up in all parts of the mine. Ten additional miners were put to work last Monday. The Thompson mill, of 16 tons a day capacity, is still running on Haywood ore. To-day the Briggs mill (20 tons capacity) will start on ore from the mine, and in a few days the Likins & Rulison mill (40 tons) will be put to work on the ore. More mills might be run on ore from the mine could they be obtained.

OCCIDENTAL.—In the upper tunnel the south drift from the north incline winze was extended 10 feet; total length, 179 feet. West crosscut No. 2 was advanced 8 feet; total length, 44 feet. West crosscut No. 3 was extended 10 feet; total length, 24 feet. Extracted 11 tons of milling ore. On the 90 level in the lower tunnel, the north lateral drift was advanced 15 feet; total length, 150 feet. From near the face of this drift west crosscut No. 1 was advanced 9 feet. West crosscut No. 2, north of No. 1, is advanced 8 feet. All of these openings are still in low-grade quartz.

CROWN POINT AND BELCHER.—A small force of men was put to work in these mines yesterday morning, and the extraction of ore from points in the levels nearest the surface resumed. Owing to the sticking of a giraffe somewhere down on the incline, as is reported, men did not go to work in the lower levels. A full force of men will at once be put on at both the Crown Point and the Belcher. The resumption of operations in these mines starts up the mills on the river, and puts to work a large number of men who have been idle for five or six weeks.

CON. CALIFORNIA AND VIRGINIA.—On the 1300 level a north drift started from west crosscut No. 1 was advanced 46 feet. South drift No. 2, started from east crosscut No. 1, was advanced 60 feet. On the 1435 level still continue stopping out the usual amount of ore from the bottom of winze No. 2, 105 feet south from the south line of the Ophir mine. The average assay value of all the ore worked at both the Morgan and Eureka mills during the week, according to battery samples, was \$35.35.

GOULD AND CURRY.—On the 300 level the south drift from the east crosscut was extended 16 feet; total length, 49 feet. It is still in clay and quartz, showing value. A north drift from the west crosscut was advanced 35 feet, and is in porphyry and quartz. Repairs to the main shaft are still progressing between the 1200 and 1300 levels. On the 62

level, at a point 70 feet from the Savage north line, the east crosscut is in quartz of low value.

CHOLLAR.—The machinery at the Sharon shaft, on the croppings of the vein, has been put in perfect order. Steam will be got up to-day and work at that point resumed. The shaft is now down 360 feet. At the old Chollar shaft a station is being cut out at the depth of 400 feet. From this a drift will be run to connect with the Sharon shaft. The drift that is being run by the Norcross folks on their 1300 level has yet to go about 100 feet to connect with the old Chollar incline.

IOWA.—Incline sinking on second back ledge to connect with north tunnel is showing considerable fine gold ore. North tunnel shows a strong ledge of good gold ore for over 100 feet, and face still going on in same kind of ore. The incline ledge and ledge in this tunnel are the same. Have just started crosscut from upper McFee tunnel to cut this ledge 100 feet vertically deeper. Fine gold prospects have been had daily during the week from all the openings worked.

ALTA.—The Lady Washington drift has now about reached the point where crosscuts will be started east and west. The Keystone upraise from the 725 level had yesterday attained a height of 131 feet. It is going up in the hanging wall on the east side of the quartz.

HALE AND NORCROSS.—The drift south on the 1300 level has long been passing through Chollar ground. It now lies but 100 feet to go to connect with the old Chollar incline. This will constitute an important air and working connection. On the fifth station level the south drift is now out about 100 feet south from the west drift. It is showing excellent quartz and some good paying ore.

YELLOW JACKET.—All is going on as usual in the ore-producing sections. About 150 tons of ore are shipped to the Brunswick mill, Carson river. A considerable amount of work is being done in the old upper levels, where new deposits of ore are being opened up. In this part of the mine are many large blocks of virgin ground.

DEST.—This mine is yielding a considerable amount of excellent ore. A patent horse-whim will soon be in operation with which to do the hoisting. The mine is on a new belt west of Silver City, through which runs that branch of the Constock which strikes south between the Justice and Devil's Gate.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running north-easterly, was extended 25 feet. This drift is now 406 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 26 feet; total length, 313 feet.

UTAH.—On the 472 level the north drift from the main west drift was extended 45 feet; total length, 410 feet. The face is still passing through vein porphyry and quartz of a promising appearance.

QUINN.—Timbering of shaft to water level completed. Arrangements are now being made for the rection of a new building and hoisting and pumping works.

SIERRA NEVADA.—On the 520 level west crosscut No. 8, started from the south lateral drift, was extended 60 feet. The face is still in a vein formation—quartz and clay.

OPHIR.—On the 1300 level, in addition to timbering, the northeast drift was extended 16 feet; total length, 180 feet. The north drift was advanced 22 feet; total length, 133 feet.

BALTIMORE.—Work is progressing favorably on the 200, 300, 400 and 500 levels. Good assays are obtained where quartz was cut into by the new drift on the 500 level.

BULLION.—The east drift on the 200 level is out 51 feet. It is still in vein porphyry. Good headway is making in cutting out the station at the 300 level.

OVERMAN.—The usual amount of ore is being extracted from the level of the Petaluma-street tunnel. The ore is worked at the Vivian mill.

JUSTICE.—Work is in progress on the 250 and 10 levels. Some good ore is being found. No new developments during the week.

ALPHA AND EXCHEQUER.—The shaft is down 65 feet below the 120 level. No work is at present being done in the drifts on the 120 level.

BEST AND BELCHER.—On the 800 level, work is progressing well in west crosscut No. 4. This crosscut is being run at the north lode.

Columbus District.

MOUNT DIABLO COMPANY.—Esmeralda News, April 2: The Mount Diablo Mill and Mining Co. having ore hauled from its mine at Candelaria. The mine never looked better and the company never had as flattering a promise of paying dividends as at present. With its new mill at Sodaville, the ore can be worked without interruption and at a saving of not less than five dollars on each ton of ore from the Mount Diablo mine, which is opened up showing plenty of ore. There are no less than 1200 or 1500 tons of loose ore in the shutes and in drifts ready to be hauled to the mill; the slopes are all showing an abundance to keep the mill constantly running. The mill, though now ready, will not start up until about the 5th inst., as the company intends having 300 or 400 tons of ore at the mill before starting. They have a few men now at work in the mine, but intend increasing the force. Heretofore the Mount Diablo Co. leased the upper mill, at Bellville, from the Holmes Co., but as it has a mill with all the modern appliances for the economical banding and reduction of ore, it is safe to predict that the mill soon to start will be kept running for a long time, say one and may be two years on the ore now in sight in the company's mine. The residents of Sodaville will soon become familiar with the music of the batteries, which will be accompanied by innumerable bullion shipments.

Spanish Belt District.

BARCELONA.—Belmont Courier, April 2: It is very probable that considerable work will be done this year in the Barcelona mine, at Spanish Belt. This is undoubtedly one of the best mining properties in the State.

ARIZONA.

MOHAVE COUNTY.—*Miner*, April 2: Dick Marsh sent down a small lot of ore from a claim on Stockton Hill, from which he realized well. Labaree and Fitch had 14 tons of galena ore, from the Star-Span-

gled Baner mine, worked last week. The dry concentrator at the Sunlight started up last Tuesday, and Supt. Barry says that it is a grand success. Brobant & Son have struck three or four inches of ore on the southeast extension of the Independence mine, which assays 891 ounces. This is one of this year's relocations. James Oliver had 7½ tons of Prosperity ore put through the sampling process last week, which netted him a goodly sum. The Prosperity is one of the best mines in the Todd basin. E. J. Edmiston came in this morning with 55 sacks of rich ore from the Nigger Baby mine at Chloide. The sampling works were crushing a carload of Oro Plata ore this morning, the first of a shipment of about 40 tons. The owners of this mine have heretofore been shipping to Colorado, and we are pleased to note the fact that our home sampling works are able to compete with Eastern buyers. L. A. Sanderson, of San Francisco, has sold out his interest in the Oro Plata and Mariposa mines, at Todd basin, to John M. Wilson, who is now sole owner of these valuable properties. Sample & Shrope started up their leaching works on the Juno mine last Monday, and are taking 15 pounds of sulphide per day. The work on the mine still continues as usual. Moosau & Higgins have struck ore on the old Sunday-School mine which assays from \$350 to \$600. W. F. Grouds and Ed Godman are running a one-stamp mill by horse-power at Hackberry siding, on ore from the mines owned by the Music Mountain Gold-Mining Co. The little mill has been running only three or four days, but long enough for the owners to satisfy themselves that they will make a success. The ore runs about \$40 to \$50 per ton in gold, most of which is saved in the working.

THE NEW DISTRICT.—*Tombstone Democrat*, March 23: From Charley Marsden, who has recently returned from Volcano City, the *Democrat* obtained the following concerning the different mines and their prospects, and also the outlook of the camp. Mr. Marsden is a practical miner and a gentleman whose opinion can well be relied upon as correct. The Beck mine has been sold to St. Louis parties for a valuable consideration, though the exact figures have not been made known. A force of eight men is now working in a good body of ore. Mr. Calhoun is in charge of the work and has now reached the depth where hoisting machinery is necessary to its profitable development. The shaft of the Volcano has reached a depth of 103 feet, with 140 feet of drifting. The ore is of very good quality, and but very little blasting is necessary, as the ground is easily broken. Supt. Smith has run along side of and exposed the vein the entire length of the drift. The vein has been tapped in several places along the drift and the demonstrated width of the ledge is eight feet and the walls are well defined in porphyry. The John Smith improves in appearance with each foot of depth obtained, as is also the case with the Bachelor and Poahontas. It is Marsden's opinion that just as soon as capital comes and the work of development is backed by money, then all of these and a great many other claims will prove to be very rich, and that the camp will stand far to the front in mining circles, but at present there is no business or work to induce men to go there unless they have sufficient means to bear expenses until the mines are developed. There are at present about 350 men in and around the camp, most of whom are waiting for something to turn up. He says that the greatest trouble is that a majority of the men who have flattering prospects are content with what they regard as a fortune, and get too rich to push their work of development themselves, and they are too poor to employ others to do it for them. Another trouble is the scarcity of water. Two wells are being sunk, having reached a depth of 70 and 80 feet respectively, with no sign of water; but they are still going down as rapidly as possible and will be continued until either water or China is reached.

WEAVER DISTRICT.—*Mohave Miner*, April 2: From a gentleman who has just returned from a trip to the Weaver district we learn the following: About eight miles from El Dorado canyon is the claim of Bowers and partner, who have lately commenced work. They have about eight tons of good ore on the dump which will not go less than \$100. Many of the new locations are within easy distance of the Colorado river, whence ore can be floated down to the Needles on barges or rafts, and from thence to the Kingman Sampling Works at a slight expense, considering the distance. Little and McLean are working the Idaho and other claims, and are getting out some good gold ore, which they are working by arrastras. Several other locations have been made, and numerous prospectors are on the way to the new district, or rather to the recently discovered ledges of an old one, for it is some 15 years since this district was formed. The claim of Messrs. Brown and Miller, which is 15 miles southeast from El Dorado canyon and about 10 miles from Little and McLean's claims, is the best developed mine in the district. They have an average of a foot of ore throughout, the first-class running from \$150 to \$400 silver, while their low-grade ore runs about 80 ounces. Of the latter there is about 60 or 80 tons on the dump which will be leached at the mine next summer.

COLORADO.

REDWELL BASIN.—*Elk Mountain Pilot*, April 2: The work done in Redwell Basin last year showed conclusively that there are a number of good mines there when they become developed. All who are interested in mines in that locality are patiently waiting for an opportunity to get to work, while others have worked during the winter, which is the best time of the year to do developing work. The Crested Butte and Daisy group has been worked all winter by Garrett Fitzgerald and others. They have been running the lower tunnel from the Daisy claim to cut the Crested Butte vein, which they expect to reach by the time that the trail is in condition to pack over. Cutting the vein at the depth which this tunnel is expected to do, good results are looked for in the way of large ore shipments. They will certainly have large enough ore bodies exposed so that it will be no trouble to make large shipments. The Ella lode, very near the Daisy, is being developed as fast as a single shift can develop it. The tunnel is run on the vein for over 80 feet, which is about four feet wide between two good walls. The vein seems to be somewhat broken with here and there a streak of galena and gray copper, lying next to a crystallized quartz gangue rock. The indications are very favorable for striking a body of mineral very

soon, although it is more than likely that the tunnel will have to be extended 40 feet or more. The Arctic lode, in the same vicinity, has a very good showing, and will probably be extensively worked this summer. Mr. Hinds, of Mt. Carbon, did considerable work on the Duster lode last summer, and will probably continue the work again this summer.

IDAHO.

FINE ORE IN THE IRVING.—*Ketchum Keystone*, March 28: Mike Carey took the lease of the Irving mine on Boyle mountain, and with but poor prospects in sight started to work with a will. He has now 12 men at work and is taking out a fine grade of ore at the rate of 20 tons a day. His lease continues until the 1st of next June, and there is plenty of ore in sight to keep him and his men well employed until that time. The strike was made last week and is considered one of the most important discovered on Boyle mountain.

THE CARRIE LEONARD.—Word was received during the week that an important strike had been made in this mine while working in the lower tunnel. The mine throughout is looking well and will produce a large amount of ore during the coming season. The report that the Alturas Gold Company has been made defendant in a suit involving the title to a portion of its property at Rocky Bar, grows out of the fact that the Ada Elmore title has been brought in issue. The Ida Elmore is the mine owned by the above company. The Camas No. 1, on the Gold Belt, is reported sold to Utah parties. The Comet mine, on Deer creek, at the head of Camas Prairie, is looking exceedingly well. The owners are Messrs. Shroeder, Hull, and Johnson.

STRIKE IN THE DICKENS.—*Challis Messenger*, April 2: The strike in the Charles Dickens within the past few days places the old mine again, after two years of lying dormant, where she had always belonged, among the first mining properties in the Territory. The water has been pumped from the lower level scarcely two weeks and development work only barely begun before a rich strike, which is unquestionable, is reported. The shaft, on what is known as the "rich vein," was sunk but three feet when a body of ore four feet in width and assaying from 80 ozs. to 1500 ozs. in silver and from one to three ozs. in gold, averaging up in the hundreds and with every indication of permanency, was uncovered; and the slight development in the shaft on the large, or heretofore low-grade vein, has disclosed ore almost equal in value to the ore in the other shaft and possessing a richness not heretofore claimed for the ore of the low-grade vein of the mine.

MONTANA.

THE MINING OUTLOOK.—*Anaconda Review*, March 31: The weather the past month has been more favorable for prospectors and a number of the boys have outfitted and left for the hills. It is too soon yet to look for any new strikes this season. About all the mining news we will get for a month is in relation to the further development of claims located last season and that have already received notice at our hands. There is still several feet of snow on Lost creek, and very little can be done toward opening the mines in that district for some time yet. In Oleson gulch the prospects are somewhat better, and work is now being prosecuted in the Silver Chain, the Stormway, and several other mines in their intermediate vicinity. It is rumored that there has been a very important strike in the Stormway, that the new vein is nine feet and runs very high. We have been unable to verify it, but do not doubt that there is a very fine ore there. C. E. Sawtelle and others shipped a car of iron ore to Butte last Monday which is to be used as fluxing at the Butte reduction works. The mine from which this car was taken is a new one located about five miles west of town. They have been working on it for some time, but owing to the bad roads have been unable to ship sooner. If this proves as good as is expected, it will result in the shipment of a carload per day to Butte. This season promises to be one of unusual activity in and about Cable, Silver Lake and Georgetown. The snow has hardly gone off enough to admit of much prospecting at present, but a number of hardy prospectors are on the ground waiting its going to commence operations. In the Blue-Eyed Nellie district work has commenced in earnest, and a number of claims which were located last fall are being thoroughly prospected. The Blue-Eyed Nellie continues to yield even more largely the fine carbonate ore for which it is so noted. The Boomerang is looking well and its owners are confident that they will soon be able to inform the public that it is second only to the Nellie. Work on the Lady Vincent will commence within a week. We were shown the other day some fine specimens of carbonates which had just been struck in a claim on the south side of Warm Springs creek about two miles west of town, which gives good promise.

NEW MEXICO.

HERMOSA.—*Black Range*, April 2: Work has commenced again on the Pelican-Eagle group, and leases have been let upon this group of claims, and the ore produced as in the past will be sent to Socorro for treatment. The Antelope has sent about 60 tons of ore to the concentrator at Hermosa. The concentrator will also treat the low-grade ores of the Embolite, Palomas Chief and Eagle. James Menefee's group of claims are rapidly becoming important. He has recently accomplished 40 feet of work on one of them. He is dumping ore in quantity; it consists of lead sulphide and carbonates. The new strike on Geo. Wolford's Homestake, assaying 710 ounces, shows a good body of ore on the sides of the north drift and in the face. Over 300 feet of work has been done on this property. Work has progressed favorably on the Humming-Bird, owned by Marshall & Stevens. In the different shafts and drifts there is a good showing of ore and another shipment of ore will shortly be made to Socorro. A strike of high-grade silver ore has been made on the Whaupack claim, owned by Grigg Titus and Eli Titus, the big cattleman of Denver, Colorado. This claim is situated on the same vein as the Metropolis. Ore is being sacked preparatory to shipping to Socorro. J. C. McCoy has bonded his Big Tree claim to H. B. Fergusson, and it will be added to the Grover Cleveland group, the property of Judge H. Brinker, W. F. Henderson, Lorian Miller, H. B. Fergusson, H. L. Warren and Thos. Smith.

Work on the Grover Cleveland progresses. The Palomas Chief is producing more ore than ever, and the new development gives great promise of the continuity of the ore bodies. From 10 to 15 miners are always engaged in extracting ore or exploring this property.

SOCORRO.—*Bullion*, April 2: C. A. Marriner is working his fraction claim in the Pueblo district. The carload of ore shipped last week by Richard Mansfield White from his Palomas Chief yielded 157 ounces silver and 6½ per cent lead. Teofilo Gutierrez & Co., of Canada Alamosa, it is said refused \$40,000 for their recently located gold claim at the south end of the San Mateo range in this county. C. N. Blackwell's prospect in the San Mateo range is turning out to be a valuable claim. The Cropping Rock returns 5½ ounces silver and a notable quantity of gold. The Graphic mine is shipping large quantities of silver-bearing galena ore to the Graphic smelter of this city by the carload, in addition to the usual supply of carbonate ore. W. B. Foster and J. S. Eddy are driving through to the antipodes in their Commercial Union shaft in the Socorro district. They are dumping free-milling pay ore and doing development work as well.

OREGON.

PROSPECTING.—*Jacksonville Times*, April 2: Much prospecting will be done this season. Prospectors are beginning to arrive from other sections. Thos. Lawrence is prospecting a promising quartz ledge near Gold Hill. H. D. Russell is working his diggings in Forest creek district and doing well. The prospects at Bybee & Hall's claim on Canyon creek, Josephine county, are very good. A windmill will be put in Rogue river, below Rock Point, by W. L. McClure, Wm. Stuart and others. Cornelius & Co.'s mill will soon be started up again and a new set of amalgamators will then be put in. Operations at Nauke, Bybee & Co.'s hydraulic mine near Kerville are progressing smoothly and a good result is promised. The continued warm weather has caused water to become scarce in placers, and some miners have already commenced cleaning up. Sherer & Judson, of Grant's Pass, who are interested in placer mines in the southern portion of Douglas county, lately added a giant and 400 feet of pipe. A Mr. Gamble, of San Francisco, has bonded the Hope mine on Wagner creek, of J. W. Walsh, for a limited period, and it is understood that operations at the mine will be resumed within a short time. Henry Knutzen, Henry Gregg, and Wm. Hinkle, who have been mining on Thompson creek, made good wages while water lasted, finding one piece worth \$14. The miners of Josephine county are promised an extended season, as snow fell to a great depth on the mountains in which the various streams of that section head. The road to Klippel & Baumele's mill is finished, and a large amount of excellent quartz which has been taken out of the mines in Jackson creek district will be bailed there and crushed. Al. Sturges, of Forest creek, has made a partial cleanup at his hydraulic mines on Jackass creek and took out nearly \$500.

UTAH.

STOCKTON DISTRICT.—*Cor. Salt Lake Tribune*, April 4: The Honerick Company started up its concentrating mill about two weeks ago and is running on its own and some custom ores. It has a large amount of milling ore, as well as first-class ore, in sight, and its shipments and dividends are likely to be considerably larger than last year. The Silver King, belonging to Alex. Niedringhaus, is putting new hoisting works on the Connor King claim, and has a good body of ore to ship as soon as hoisting works are complete. In the Calumet I hear they have cut a very good ore body on the 400-foot level, at the crossing of a north and south vein, the ore streak being over 7 feet thick of carbonates with galena mixed through it. It is a very strong-looking ore chimney and it is thought will prove up well, which is much to be hoped for, as the owners have spent considerable money in the camp. It is reported that the Fritz Hill Co. will put on a force of men and commence shipping. Several leasers will soon be shipping ore, notably among them J. T. Keegan on Cygnut, Keystone and Hercules claims; also L. Causey, who has worked so long and faithfully running a 500-foot tunnel to cut the old Mabel vein. There are many other promising prospects being worked. In Dry canyon the Hidden Treasure people are shipping considerable ore, and I hear have good bodies in sight; several other leasers are getting out some quantities. On the Ophir side the Consolidated people have cut a vein of carbonates and galena from two to three feet thick in the Grey-rock, and have over 100 tons on the dump. They will commence shipping soon. The Jim Fisk people have been shipping some and have a good body of ore. Other mines are getting ready to ship, and if a concentrator were to be built at Ophir it would help the camp very much.

REVIEW.—*Salt Lake Tribune*, April 1: The week has been one of remarkably fair and even weather, quite favorable for mining operations. No great event has marked the seven days. Movements of the metals have been fair, and ore has come down from the hills freely. The receipts of the week in this city, ending the 30th, inclusive, were \$108,612.04 in bullion and \$49,148 in ore, a total of \$157,760.04. For the week previous the receipts were \$158,739.66; of which \$108,424.60 was bullion and \$50,315.06 was ore. The Ontario output for the week was 31,470 fine ounces of bullion and \$808.13 ore sales, a total of \$39,508.13. On March 31st the Ontario pays its third dividend for the year, of \$75,000, or a total of \$225,000 in the three months. This is the 13th dividend in all, being an aggregate of \$3,150,000 in dividends. The Daily product for the week was six bars of bullion, \$774.28 fine ounces. No ore sales. Fine bar receipts for the week were to the value of \$46,711.18; base bullion, \$4275; gold bars, \$15,770; common lead, \$6345.36. The Hanauer smelter produced for the week, \$25,190 in bullion.

BULLION SHIPMENTS.—On the 25th of March the Ontario shipped 53 bars of bullion, containing 28,323.22 fine ounces of silver, and Thursday, March 31st, the shipment was 36 bars, containing 19,186.68 fine silver ounces; total, 89 bars, 47,509.90 ounces. The Marsac mill shipped on March 21st, 8 silver bars, containing 9417 fine ounces; March 26th, 6 bars, of 6957 fine silver ounces, and yesterday, April 1st, the shipment was 8 Daly bricks, of 8598 fine ounces; total for the 10 days 20 bars, 25,332 ounces,

THE FRISBEE-LUCOP MILL,

A CENTRIFUGAL ROLLER MILL

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

THE FRISBEE-LUCOP MILL CO.,

Office, 145 Broadway, cor. Liberty St., NEW YORK.

SILVER-PLATED AMALGAMATING PLATES

FOR SAVING GOLD

—IN—

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used. Weight Guaranteed.

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

NOTICE—My Silver-Plated Plates are well known, and in use everywhere. They still continue to assay at least one-quarter more silver for the same money than any plates made here. One trial of my plates in competition will prove this. Light, thin silver-plating looks the same as heavy, but has no durability.

LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

A. T. DEWEY, } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED
W. B. EWER, } 1860
GEO. H. STRONG. }

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enabled us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Business is very light in the stock market, everything being rather dull. Up on the Comstock the miners are working away diligently. In the Savage they have found some rich ore in the upraise from the 500 to 600 levels, and on the 800 level the outlook is favorable. On the Chollar, work has been resumed in the Sharon shaft. In Con. California and Virginia, explorations are going on and ore is being extracted. The Virginia Enterprise says: There is nothing discouraging in any part of the mine; on the contrary, there are some encouraging features of which something will probably be heard in due time. Arrangements are being made to float that section of the old works in which a smoldering fire has for years existed with carbonic acid gas. This gas being heavier than air, will, when introduced, sink to the bottom of that portion of the mine which is pent up by bulkheads. Enough of the smothering gas will be introduced to fill all the space to and above the fire, which will then be drowned out just as by water, though much more effectually, and without the slime, caving and other disadvantages incidental to the introduction of water. At the south end of the Comstock the outlook is good. At the Haywood, which lies directly to the south of the lower end of Gold Hill, a great amount of ore is opened up and ready for extraction. Two mills are now running on Haywood ore, and a third will start up in three or four days.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department to, San Francisco:

CANDUS M. Co., April 2. Capital stock, \$400,000. Directors—T. E. Luty, W. B. Murdock, T. E. Jewell, D. B. Arthur, and John Henderson.

COLUMBIA RIVER PACKING CO., April 5. Object, canning and preserving salmon and other fish. Directors—Thomas Cutting, N. W. Tallant, Sidney M. Smith, A. D. Cutler, and F. Hobron. Capital stock, \$100,000.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Argus, April 2, \$3314; Bannock, March 26, \$1300; Hanauer, 26, \$5700; 27, \$7200; Bannock, 30, \$2800; Hanauer, 30, \$2090; Alice, April 1, \$4844; Hanauer, 1, \$1600; Silver Reef (for March), \$16,476; Hanauer, 2, \$1800; 3, \$5420. Wells, Fargo & Co. received at Salt Lake last week in bullion \$75,594; McCormick & Co., \$75,820; T. R. Jones & Co., \$5345.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, promote a useful enterprise, and, at the same time, earn a good, honest living. Send name, age, business experience, and good references. Apply to Dewey & Co., 220 Market St., S. F.

P. S. Readers of this notice can help our common cause by informing persons, likely to become good agents, of this chance.

DELINQUENT NOTICE.

Gover Improvement Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, Cal. NOTICE.—There are delinquent, upon the following described stock, on account of Assessment No. 2, levied on the 23rd day of February, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Eugene Dutilh.	3	10	\$100 00
Eugene Dutilh.	46	5	50 00
J. C. Haelton.	36	10	100 00
A. Ogden.	1	10	100 00
A. Ogden.	45	5	50 00

And in accordance with law, and an order of the Board of Directors, made on the 23rd day of February, 1887, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of said Company, on Tuesday, the 26th day of April, 1887, at the hour of 3 o'clock p. m., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

OFFICE—318 Pine St., room 5, San Francisco, Cal.

To Every Pump Maker,

Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION of any ADJUSTMENT of ANY KIND of a PUMP which is not answered in MR. ROBERT GRIMSHAW'S PUMP CATECHISM,* we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

*Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

DEWEY & CO.,

220 Market St., S. F.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.
Sole Manufacturers,

227 First Street, San Francisco, Cal.

California Inventors

Should consult **DEWEY & CO.** AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1850. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors for better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., San Francisco, Elevator, 12 Front St.

H. H. H. HORSE LINIMENT.
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spasms, Windfalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from **HERCULES**, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearings, cogs or pulleys.

Power applied direct. Works Ore at Low Cost
More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

WM. GUTENBERGER,

Sacramento Foundry, Cor. N and Front Sts.,
SACRAMENTO, CAL.

**BROCK'S PATENT DROP FORGED CHAIN PIPE WRENCH**

MADE ENTIRELY OF BAR STEEL. Six Sizes; adapted for Pipe from 1/2 to 14 inches diameter.

Each number will fit a range of sizes equal to six or more pairs of common tongs, while it will outwear an equal number of any kind.

All parts are interchangeable, and can be readily renewed.

Jaws are hardened to a saw temper, and can be sharpened with a file.

Does not crush pipe; has a quick grip; never slips; chain will not unhitch while in use, but can be instantly released.

HOOD'S FOUNDRY COKE.

Consumers are respectfully informed that owing to inferior brands of Coke having been sold in this and other countries under the name of "Patent Coke," the Glamorgan Coal Co. (Limited), Cardiff, in May, 1884, abandoned the title of "Patent Foundry Coke," substituting that of "Hood's Foundry Coke."

This Coke is exclusively used by the Selby Smelting and Lead Co., Union Iron Works, Professor Thomas Price, and other consumers here. Large quantities are regularly forwarded to Copper Smelters in Arizona and New Mexico, and also to consumers in Nevada and Salt Lake.

The undersigned are the SOLE IMPORTERS of the above Coke, which is for sale in quantities to suit purchasers.

\$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF HYDRAULIC GIANTS**, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

Prices furnished upon application to **JOSHUA HENDY MACHINE WORKS,**
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our
IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

THE HAZELTON BOILER.

A NEW DEPARTURE AND RADICAL CHANGE IN FORM OF STEAM GENERATOR.

The Most Notable Improvement ever made in this Department of Engineering, affording a degree of Safety, Durability and Economy never before attained. Over 100 now in use, aggregating upwards of 13,000-Horse Power.

THE NEW YORK MUTUAL GAS LIGHT COMPANY has been running a 275-horse power Hazelton day and night for the past six years. Also five more, aggregating upwards of 1000-horse power, all carrying 125 degrees pressure. The Superintendent says: "Not a new tube has been put into any of them, nor have they required any repairs whatever. They do not scale, are easily managed, perfectly safe, and I consider them the best Boilers extant."

THE HUDSON GAS LIGHT COMPANY, of Hoboken, N. J., has used two 80-horse power for two years, running day and night, and the Superintendent says: "They have required no repairs and are in as good condition as the day they were completed. Are quick steamers and economical in fuel. The lowest grade of fuel produces and maintains for us not less than 100 pounds steam pressure, at which we always work."

MESSRS. ALDEN, SAMPSON & CO., OF NEW YORK, say: "The 200 and 350-horse power Hazelton Boilers which we have at our Works at New town, N. J., as well as the 40-horse power in use at our factory at Hallowell, Maine, are giving good satisfaction. We consider them very economical in fuel, easily kept clean, rapid producers of an abundance of dry steam, and perfectly safe."

THE JERSEY CITY STEEL COMPANY, of Jersey City, N. J., are using two 100-horse power, utilizing the waste heat from flue boilers. The Manager says: "Each Boiler gives us from this waste product nearly 100-horse power, after passing through a 30-foot Flue Boiler. They require no repair, we experience no trouble in keeping them clean, and they are every way satisfactory. The quantity of fuel to produce a given result is decidedly less than any Boiler we have ever used."

The Superintendent of the **LA LUZ MILLING CO., OF GUANAJUATO, MEXICO,** after using a 70-horse power for a year, says: "I have run it with the worst water I have ever seen put into a Boiler without experiencing any trouble whatever. In the matter of economy, nothing can equal it. The 70-horse power Hazelton used only half as much wood as the 25-horse power Tubular Boiler which it replaced, developing twice the power. I see nothing to indicate that it will not be the most durable, as I believe it to be the safest and most economical Boiler now in use. I have had nearly 20 years' experience with all kinds of Boilers, and give the Hazelton preference against all competitors. In fact I told my company that we could not afford to run the ordinary tubular or any other kind of Boiler if they were put up in our Mill free of cost. I have ordered three more of 75-horse power for the new Mill of this Company, now being erected."

HENRY DISSTON & SONS, OF PHILADELPHIA, the well-known saw manufacturers, after running a 60-horse power Hazelton fourteen months, ordered seven more for their works in Tacoma, Pa. The General Manager says: "The 60-horse power Boiler bought fourteen months ago has developed an average of 35-horse power, and it has not scaled or given us a particle of trouble. We consider them the best Boilers made."

THE WYOMOUTH PAPER MILLS OF NEW JERSEY, after running a 100-horse power about a year, say it gives perfect satisfaction, and they consider it the best Boiler made. Steam dry; also works much beyond its rated capacity.
Reference is also made on this Coast to the California Cotton Mills at East Oakland, running a 150-horse power. Also to the Black Point Pumping Station of the Spring Valley Water Works, San Francisco, running a 200-horse power, and the Southern Pacific R. R. Co. running a 75 H. P.

Saving Slimes.

Concentration of ores is simply the separation of the heavy from the light, and is performed sometimes on dry ore, but generally water is used, and especially in California, where it is practiced principally on ores of gold and silver. Occasionally the lightest—or finest—part of the crushed ore is very rich, and is worth saving by itself. In dry concentration this is the dust. In wet concentration this light portion is the slime, and, if rich enough to be saved, the pulp is passed through a pointed box.

The slimes pass off from the top, to be settled and saved, the balance discharging from the bottom to the concentrator for separation and saving of the mineral. In some cases it is preferable to put the pointed box below the concentrator, and thus separate from the tailings, and save the rich slimes. As a rule, however, most of the money in the slimes exists as finely divided sulphurete, which are caught and saved with the balance of the sulphurets by the best concentrators, so that there then is only an occasional ore the slimes of which need segregation and saving.

Mr. J. M. Adams gives, in the last report of the State Mineralogist, the following description (with engravings) of the pointed box:

Several forms are in use. Their dimensions vary according to the duty required. In some cases it is desired to save and settle together all the pulp, including the slimes, when there is too much water present for subsequent concentration. In such event the pointed box should be about 6 feet deep, and 3 feet by 7 feet at the top, the longest sides sloping till they meet at the bottom.

Such a box will settle and save about 6 tons of ore in 24 hours, discharging it automatically and continuously from the bottom by a siphon hose, with the proper amount of water for subsequent concentration.

This form is used when the tailings from pan amalgamation are to be concentrated, after leaving the settlers and agitators, for they contain a large excess of water, which must be gotten rid of, so that the tailings are of

the proper consistency for concentration.

The accompanying cut shows a form of point box used in cases where the slimes are to be separated from the pulp and saved. Each box is 40 inches square at the top, and 40 inches deep, coming to a point at the bottom; and one box will handle from 6 to 10 tons of pulp in 24 hours, making a good separation.

The pulp from the battery, entering the box

uses in place of the hollow wooden plug shown, a $1\frac{1}{2}$ inch iron tee with one end plugged, and with three-fourths inch side outlet, attaching the siphon hose by nipple.

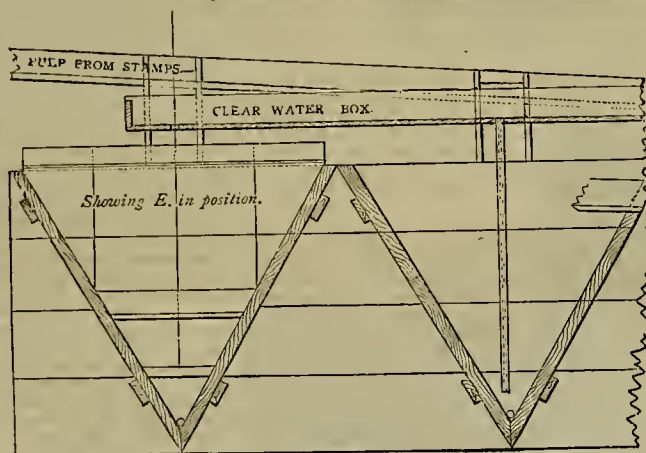

The care to be used on the new cable road on Powell street, in this city, are both strong and ornamental, being constructed after the style of those in use on the Market-street system,

Arguing an Issue that Has Never Been Raised.

It is curious to observe how a combat will sometimes be waged against an idea that is itself the mere figment of the writer's brain, the assertion that mining is a legitimate industry furnishing a case in point. There is a class of writers who, whenever anything is said against the wrongful methods by which mining is sometimes carried on, at once begin to asseverate that the business is legitimate, iterating and reiterating this assertion as often as occasion may seem to require. Now, this arguing the legitimacy of mining appears to us to be altogether a work of supererogation, inasmuch as it does not appear to have ever been called in question. There has been a great deal written, and very properly, in denunciation of the abuses and frauds committed in connection with mining, but these strictures are not to be mistaken for attacks upon the business itself, which, as far as we know, has never been arraigned on the charge of illegitimacy.

This apologetic style of arguing in defense of mining should be abandoned as implying that it really may be attacked on the ground of its unlawfulness. What would be thought of the agricultural journalist, who, to any just criticism on the evils of gambling in wheat, should enter into a serious disquisition on the lawfulness of raising that cereal? That villainies innumerable and of the worst kind have been perpetrated in the name of mining, cannot be denied. They have been not only illegitimate but infamous. But this malfeasance has had no more to do with the business of mining proper than with preaching the gospel of the new dispensation. It will be time enough to contend for the legitimacy of mining when the idiot disposed to raise that question shall put in an appearance. There is no use of contending for what is universally conceded nor arguing an issue that has never been raised.

THE Silver King Mining Co., of Arizona, produced 853,187 ounces of fine silver in 1886, and paid \$220,000 in dividends.

POINTED BOX FOR SAVING SLIMES IN CONCENTRATING.

at the top, is confined by partition E, until it passes into the box proper, near its bottom. Clear water is conveyed from above through a half inch pipe, which delivers it into the box at the bottom. Care must be taken that this pipe is kept full, so that no air bubbles are caught through it, as they create agitation, and cause sand, etc., to pass off with the slimes.

The amount of clear water needed varies, so it is a good plan to have a cock in the pipe just below the clear water box, or else partially close, with a wooden plug, the opening of the pipe in the clear water box. At D is a hollow plug, and to it is attached a piece of hose, which is used as a siphon, so that the pressure is lessened and too violent discharge of the pulp is prevented.

Without the siphon hose, two-eighths inches opening would not be too small, while with it three-eighths inches opening is about right, and the end of the hose is plugged accordingly. Inasmuch as foreign coarse material occasionally gets into the box (prevented as much as possible by a screen over the top), it is advisable to

both dummy and conpe being made in one. They are to be 28 feet in length over all, and will have curtains at the windows instead of blinds. The roof will be laid in panels of Lin-crusta Walton. Electric lights will afford the illumination at night. There will be no water-ehed, as it will be caught and carried off in pipes. Wire guards will protect the public from the wheels of the vehicle, and the forward etanchions being left out will make the dummy more accessible.

THE people at Anaconda, M. T., are indignant that a dispatch giving the details of a plot to take possession of J. B. Haggin's great smelting plant at that place by force of arms, apply the torch to \$1,000,000 worth of property and assassinate the officers of the company, has been sent abroad. The story is declared to be a wicked and malicious fabrication.

MANY miners are leaving Juneau, Alaska, for the Yukon and Stewart river mines. It is said the best diggings have been discovered on Forty-mile creek,

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EBS.

The Cargo Muchacho Mines.

Sketch of a Southern California Mining District.

EDITORS PRESS:—I have just returned from an examination of the mines in the Cargo Muchacho range. The district lies about 12 miles north of Yuma, in this State, and six miles from the nearest point on the Southern Pacific. The station from which all supplies are shipped to the mines is called Ogilby.

The Cargo Muchacho mountains rise like an island in the sea of sand which stretches for miles in the southeast corner of the State. The landscape is dreary and uninviting in the extremes. Wood is scarce, and water is still more so. A healthful climate is all of which the inhabitants of that region can boast, as far as comfort and conveniences are concerned. The mountains are, I should say, 20 miles in length and from three to five miles wide, with a northerly and southerly trend. They consist entirely of metamorphics, there being no igneous rock except an occasional bed of lava, the vent of which, owing to limited time, I failed to discover.

The rocks are full of veins of quartz varying in width from an inch to several feet, and are for the most part simply lenses of barren rock, though occasionally they contain iron oxides and copper carbonates, and when this is the case a prospect can usually be obtained.

There are, however, several fissures which have considerable continuity, and which have developed in depth all the characteristics of true fissures.

These veins, of which the Cargo Muchacho is the most extensively developed, are gold-bearing, and some of the quartz is rich, showing much free gold. As this mine is the largest and richest in the district, a short description of it will suffice for all of the fissures. At the surface it was but a foot or 18 inches in width, but as depth was attained it was found to pinch and swell like most fissures. In many places the vein exhibits a distinctly handed structure, and the walls are well defined throughout. The vein traverses a belt of hornblende schist, which in places gives place to chlorite schist—formed from a decomposition of the hornblende. Talose and clayey matter constitute a gouge, which in a few instances completely fill the fissure, but forming an infallible guide to other ore bodies.

The mine is opened to a depth of 378 feet, I was told. Most of the ore lying above the 200-foot level has been stoped out and milled in a mill situated some eight miles distant on the Colorado river. The ore milled averaged \$12 to \$14, and paid something in dividends; but poor management has thrown the property into disrepute, and it now stands idle. It is the opinion of those best acquainted with the operations, as carried on there, that the mine can be worked to profit.

The lowest levels of the mine show from 5 to 8 feet of ore of good grade, better, in fact, than much that was stoped from the upper portion of the vein. It is perfectly free-milling, specimens of bright gold not being uncommon. As yet, there is but little sulphide in the rock. The gangue consists principally of quartz, with some calcite and feldspar. It is extensively mineralized, carrying iron oxides in large quantity, and also showing copper carbonates. Occasionally, orange-red crystals of wulfenite can be found and another mineral which I take to be a decomposition of zinc-blende. I found neither zinc-blende nor galena, but the presence of the wulfenite leads me to believe that, when the sulphide ore is encountered, galena will be found, together with iron and copper pyrites, and doubtless, also, chalcopryite, as it is beyond question from these latter that the iron oxides and malachite originate.

Other veins in the neighborhood show much the same characteristics at the surface as the Cargo Muchacho, and may possibly in time become productive.

Of course, the district is sadly handicapped, being located in the midst of a desert, but the confidence which the prospectors have in their mines, and their determination to develop them, may yet result in bringing them to the front.

The Rich Rock mine is located in the northern part of the range, and I did not visit it, as my business did not call me there; but I was told that the vein was large but of low grade.

The Padre y Madre mine lies in a valley at the western base of the range, and but little over a mile distant from the Cargo Muchacho mine. A score of shafts have been sunk in the flat, and many hundreds of tons of ore extracted and milled, but with what results I could get no satisfactory information. At any rate, all operations for the time being are suspended.

I am of the opinion that some of the mines of the district could be worked profitably, if properly managed, because, in the face of so many disadvantages, it is necessary to work with the strictest economy and care.

There is a silver district located in another range of mountains, about 20 miles to the northward, but I know nothing of them. The ore which was shown me consisted principally of carbonate of lead, and was said to carry about \$30 in silver.

There are several prospectors working dry

placers in the Cargo Muchacho district, but the result of their labors would tempt few to join them.

Considerable work has been done at various points in the range on large ledges of copper-bearing rock. The ledges are simply huge hands of quartzite in which the copper occurs as an impregnation. Occasionally, segregated bunches of the ore are quite rich in copper, but the rock carries little of the precious metals.

I cannot say, during a week's sojourn in the wilderness, that I formed a very strong attachment for the place, though I believe it has a brighter future than its past history would indicate.

W. H. STORMS.

Construction of Fortifications.

EDITORS PRESS:—There is being manifested at this time on the part of the Government a disposition to put the seaboard cities of our country in a better defensive condition. General Sheridan has proposed the establishment of sunken batteries for the protection of harbors. Such a system of defense would prove entirely inefficient from the impossibility of operating guns in such structures of sufficiently heavy caliber to be effective against the iron-clad ships of other nations. Another serious defect in such a system as that is the entire absence of any protection from shells, either for the guns or the men operating them. Ramparts of earth and revetments of wood or masonry are obsolete and entirely unfit for permanent fortification at this day. In the present state of military science, all defensive works of a permanent character must be constructed of iron or steel. Captain Ericsson has recently proposed the plan of erecting furnaces on the immediate spot, and casting the walls of a fort solid in place where they are to stand. This method of construction, if at all practicable, would certainly prove a very costly one. I propose a plan which I think would produce a structure equal in efficiency with what might be accomplished by Captain Ericsson's method, and at less expense of construction than by any system of erecting iron or steel armor now in use. In illustration of my plan is a sectional view in profile of the top of a wall in the angle of a square redoubt, to be composed of plates of Bessemer steel, each one being cast with a dovetail projection on

one side, with a corresponding cavity directly opposite on the other. In this process of erection a plate would be set on end on a suitable foundation, in the proper position for the beginning of the wall. Then another plate would be hoisted in a vertical position until the dovetail projection at its lower end was inserted in the corresponding cavity in the standing plate, when it would be allowed to descend to the same level. That operation would be repeated until the structure was completed. Then, or while the process of setting up was going on, the interstice between the plates would be filled with molten metal, either of the same kind of steel or some more fusible metal, thus making it practically a solid steel wall without the use of either bolts or rivets.

The profile represents a wall of two feet in thickness, composed of plates four inches thick. But the thickness of the wall may be increased or diminished, the only consideration necessary in that respect being the cost of the crude material, and the thickness of the plates would be determined mainly by regard to convenience in handling. Permanent fortification barriers of any practical utility must be built of iron or steel, in the form of redoubts, casemated battery shields or isolated revolving turrets. The plan which I propose may be readily adapted to all those forms, and in cheapness, facility of construction and effective durability will, I think, compare favorably with any others now in use or heretofore proposed.

San Francisco, April 4th.

ANON.

Detonating Meteorites.

EDITORS PRESS:—The article in the PRESS of the 2d inst., on the "Explosion of Meteorites and Causes of Thunder," by Mr. Hirn, from a late number of *Nature*, has established the true physical cause of a wonderful phenomenon which occurs so seldom as to be thought by many to be mythical. It has been my fortune to witness such an occurrence only once during a long life. The locality was at Carhilo, in

Meadow Lake Mining District, near the summit of the Sierras.

At 10:30 o'clock on a clear and warm evening, about the middle of September, 1867, there were gathered on the plaza around a camp-fire of packers a few miners and myself, when suddenly the whole scene was illuminated with a glare of light. The cause was quickly discerned to be a glowing aerolite apparently as large as a football, in the west, at an altitude of about 25°, passing with great velocity from the south to the north on a descending angle of about 10°. It was visible about four seconds, and passed out of sight behind a western spur of the "Old Man Mountain;" during which time, according to the estimate of the mean velocity of meteorites penetrating air, by Hirn, it passed the distance of 96 miles at the rate of 31 miles per second, or nearly double the speed of the earth in its orbit around the sun. In a little less than one minute from the appearance of the meteor, a concussion and roar, as of the loudest thunder, struck our ears and shook the buildings of the town, and every person in bed was aroused and soon on the plaza wondering at the commotion. The rolling, rumbling sound like thunder continued over 3½ minutes, but not with the same intensity as during the first few seconds.

We can calculate the distance of its nearest approach by the time intervening between the sight and sound. If we assume that the average temperature through which the sound passed was 33° F., it traveled at the rate of 1100 feet per second, and in one minute a little over 12½ miles, and continuing for 3½ minutes, it was heard a distance of nearly 50 miles on each side of the nearest point.

It can be readily perceived why the first shock was so intense. The angle is so light from the point of hearing to a distance of four miles on each side of the nearest point of approach that it would make a difference of only one mile in the distance the sound traveled to the point of hearing, and hence the whole volume of sound produced in eight miles of the meteor's flight was condensed and precipitated at that point in less than five seconds.

This meteorite was observed in many places in the valley and foothills and described in the newspapers, but no mention made of the detonation.

J. E. SQUIRE.

Calico Mines.

EDITORS PRESS:—The mining outlook is still good in the southern part of California. The King Company, at Calico, are building a 60-stamp mill with 800-pound stamps near Daggett for a mine known as the Waterloo. This mine is situated on the edge of the mountain three miles west of Calico, near the plains. The vein is in quartzite formation. At a depth of 100 feet the vein is 20 feet wide. The rock is very dark and hard, but shows plenty of horn or wax silver. The vein runs along the southwest base of the Calico hills. Easterly half a mile is a place on the same vein evidently, owned by Barber & Co., and known as the Total Wreck. There is a 200 foot tunnel, and they have sunk 75 feet on a vein of fine milling ore. East Calico has also a good strike of high-grade silver ore. In the Josephine mine, rich ore has been found. Many chlorides are busy on other prospects. One party is prospecting the old King ground, and there are better prospects ahead.

S. P. BLADE.

Calico, San Bernardino Co.

NATURAL GAS IN UTAH.—Natural gas is now being used at the salt works at Lake Shore, the old Utah Central bathing resort, for the purpose of making salt. The experiment has only been recently tried, but so far it has proven to be a most unqualified success, and the proprietors are jubilant over the result attained. The method employed is the vat principle. The water is pumped from the lake into a vat raised a few inches higher than the one in which the salt is made. The two are connected by a pipe, the mouth of which is protected by a fine wire sieve, which prevents any foreign matter entering the lower vat. Underneath the lower vat, which is 12 feet by 5, and 14 inches deep, four large jets of natural gas are placed, and these give out an extreme heat that is simply remarkable. The gas wells were struck, it will be remembered, accidentally, or rather while the owners were driving for water, and they are now turned to better advantage than the water could have been. The method of making the salt is an extremely simple one. The water is run into the vat, the gas jet lighted, and when the brine attains a great heat, the salt being the heavier body, sinks to the bottom, and the magnesia, alkali, etc., float on the water. The salt is gradually drawn away from the impurities, and when the operation ends the result is clean, white salt, such as makes some of the brands now on the market assume an ebony tint by comparison. The salt is claimed to be much purer than any other similar lake product, and if snowy whiteness goes for aught, they certainly have good grounds for their assertions. The using of natural gas onto down expenses materially, and it may be that the gas will form one of the great natural resources of the Territory.—*Salt Lake Herald*.

THE Gold Hill Mining and Milling Company, at Quartzburg, says the *Idaho World* of the 25th ult., made a cleanup of \$8000. This is the first run made by the new mill, and the cleanup equaled the expectations of the owners.

Work on the Mother Lode.

A Sketch of Amador County Mines.

A correspondent of the *Chronicle*, writing from Jackson, Amador county, says: Last fall we heard of a boom in mining to come in the spring, and from all indications it has come in a mild form, and prospects are being developed on every hand. Several large transfers have been made in Plymouth, Sutter and Jackson. Messrs. Treglons, Minear and others, who have been in the East of late, find this place little known, except by those interested in the Plymouth Con., Bunker Hill, South Spring Hill, Medium and a few others largely owned East, only a few being listed there. Plymouth, which is always lively with the number of men employed by Hayward & Co. on their syndicate of mines, will soon have an additional 40 stamps in operation. The New London is pushing work with all speed, together with others who have started work in earnest, so as to not only make this the second but the first producing county in gold on the coast, being able to work low-grade ore at a large profit. Following southerly, along the mother lode, the first working mine encountered is the Old Potosi, with its ten-stamp mill going to its full capacity. Next is the Black Hills, belonging to Palmer Rule and others, with a large body of ore and ten stamps. It is understood that English capital will purchase this claim and add 30 stamps, and also purchase adjoining property.

Then comes the Gover Mill and Mining Company, who run their 20 stamps regularly. This must be a fine-paying property, from the rich ore found in the north shaft of the 400-foot level, though the mine has been prospected 900 feet. The Randolph, at Drytown, with its three stamps, is working on good ore, and Mr. Randolph is sure of a bonanza.

The Quartz Mountain—a blanket, or flat ledge—is running a 10 stamp mill with success, the rock going \$5 and the sulphurets said to be \$1740 to the ton. Any miner who inspects the claim cannot think otherwise than that the ledge will "right up" somewhere in the hill, and he one of the largest mines in the State, on account of the cheapness with which it can be worked. Other claims adjacent have lately changed hands, the Goodwin being one that work is progressing on. A short distance farther is Culbert's 10 stamps, working on his individual property with success. Again returning to the main line of mines, though all are on the same general mother vein and same character of ore, we come to the Bunker Hill with its extensive plant, 40-stamp mill, chlorination works and hoisting machinery, owned mostly in the East, and one of the standard mines in Amador City. Next is the Amador, owned by Hewitt & Culbert, who are putting up a mill. The ore in sight gives every indication of success. This mine was sold to and prospected by an English company before the era of working low-grade ore. Mr. Hewitt is the superintendent of the famous Keystone mine, owned by the Messrs. McDonald, of San Francisco. This mine has a history for its regular and prolonged dividends. It has a 40 stamp mill.

The South Spring Hill, J. K. Treglone, superintendent, has now 30 stamps, and from all accounts is to-day one of the richest mines in the State, and will be able for many years to add to the store of gold. It is owned partly in Boston, and will have additions to its mill again this spring.

Sutter creek, one of the prettiest of mountain towns, looms in sight with her old Eureka of fame. The Lincoln, Stewart and Mahoney mines are well known in the State, and combine 90 stamps, making new life in the town. The Wildman, that was lately sold to Eastern people, is having hoisting works put up and will take rank as a producer this season. Soon after leaving Sutter the Kennedy mine is reached, so long idle, but now worked by San Francisco capital, and from the regularity of payday and the steadiness with which the mill runs it is thought to be a paying investment. It is now under the charge of Superintendent Parks, late foreman of the Keystone. The Zeile mine, chlorination works and mill go on with the old-time regularity, working 125 men. Its past record has been nearly unexcelled and it has bright prospects for at least a decade.

Between the Kennedy and the Gwin mine the first of the prospects to attract attention is the St. Elton, owned by Messrs. Simmons and Davey, who are on the direct line between the two mines mentioned. They have run in a tunnel 150 feet, cutting a three-foot ledge with well-defined walls, slate gouge and exactly the same character as the above mentioned. After drifting on the footwall 50 feet the rock has improved with such rapidity as to warrant the owners putting up a mill, as the ore will pay \$8.23 gold and two per cent sulphurets of a high grade. In many of the prospect shafts on the claim the ore is much higher, carrying free gold in abundances. They will send their sulphurets to Messrs. Barney & Vorheese, of Sutter, who are the standby for the mines, having chlorination works in Sutter and Drytown. The St. Elton has attracted many mining men and capitalists of late, who speak very highly of it, and 1887 will undoubtedly see it among the hullion ships.

The Valparaiso adjoins the Mammoth tunnel claim and is very high grade, being coated with gold and found in few places as rich in this whole mineral belt. Next comes the Middle

Bar claim, on the Mokelmnas river, where they are sinking a double compartment shaft on a very promising ledge, and the superintendent is confident it will mill \$15.

This is one of the cheapest places in the world to mine, on account of the abundance of wood, water and low wages, this help being largely Italians and Austrians, except in Plymouth. Amador also takes high rank as a fruit country.

Southern California Sketches.

Our engravings give little glimpses of some points of interest in Southern California. In a country where there is such a profusion of charming scenes, acceptable either for beauty or historic interest or as exponents of recent progress and development, it is hard to make selection. A choice must be made, however, and the artist has consulted his own inclination. In the upper left-hand corner is one of our grand native oaks, which will convince the stranger that though California has great open plain-like valleys, and is frequently described as a treeless country, we have really great resources in arboreal beauty, in addition to the sequoias which we are generally credited with. Our California oaks are indeed grand trees and they are well scattered over the State. The engraving gives a good idea of the symmetry of the tree, although many specimens would be even more beautiful than the one here sketched, because of greater height in proportion to the breadth. At the upper right-hand corner is shown a roadway lying through a grove of these oaks—a scene such as can be enjoyed in many parts of the State—the special location in this case being near Pasadena.

In the center the artist gratifies his historic inclinations, and gives us a picture of the famous San Gabriel Mission church, an old structure which is being closely pressed upon by the march of improvements—the locomotive screaming by it on one side, the dusty highway on another—while the orchards and vineyards occupy the old lands of the padres.

In the lower picture is a newly established cottages home, with its vineyard on the lower ground, and beyond, over the trees, lie the wide valleys encompassed by foothills. This is no one of the mere, beautiful for outlook and desirable for rich warm soil and genial air—meads which are now being thickly covered with villas surrounded by orchards and vineyards.

In the brace of little pictures below are given two glimpses of Riverside, whose fame is golden. One sketch gives a bird's-eye view of Riverside, but shows only a small fraction of the territory which by enterprises, and money, and water, has been transformed in less than a score of years from a hunting-ground for coyotes into a garden spot, whose wealth reaches millions and whose reputation is world-wide. The other sketch shows a section of Magnolia avenue, with its handsome border of trees and palms—a drive which for length and beauty is unparalleled.

A NEW COAL DISCOVERY.—John Kilcourse brought to the *Courier* office yesterday a specimen of coal found on the ranch of Peter Malone, on the east side of Sonoma mountain. A chunk weighing about 35 pounds was hurled by Mr. Percival, of the Golden Eagle mine, who pronounced it as good as Seattle coal cropping. It burned readily. The specimens brought to this city were taken out six feet below the surface, where there is a regular vein from 12 to 14 feet wide. Of course the specimens taken so near the surface are nothing but croppings, but it is believed that by sinking a shaft a good quality of merchantable coal can be found. The vein is solid and six feet underground looks very promising. We have no doubt but that there are millions of dollars worth of good coal providentially stored away within the bowels of Sonoma mountain. —*Petaluma Courier*.

THE Lexington mines are located on and about Alamo mountain in Ventura county. The Frazier mine are but a few miles distant, but in Los Angeles county. A spur of the Alamo mountain runs north into the latter county, in which the Cedar Mining District is located. There are three quartz mills in constant operation in the latter district, and the claims are said to be rich and producing a profitable yield. —*Ventura Free Press*.

QUICKSILVER SHIPMENTS.—During the month of March the following quicksilver shipments were made to San Francisco from Calistoga by the here mentioned mine: Napa Consolidated, 220 flasks; Sulphur Bank, 111 flasks; Great Western, 105 flasks; total number shipped, 436. Large shipments of quicksilver were also made from the Etna and Oak Hill mines near Pope Valley. The Bradford mine has not been shipping much on account of repairs now going on there.

IDLENESS A PUNISHMENT.—Seven hundred convicts at Sing Sing are feeling very badly because there is nothing for them to do. They used to be employed in making stoves, but the contract has expired, and now they will be confined to their cells. This they consider far worse than working.

The Upper Yukon River.

Something of Alaska's Mineral Resources.

The following extracts are taken from a letter of Dr. Willis E. Everett, being extracts from his report to the War Department, taken while on his reconnaissance of the entire Yukon river in the summer of 1884:

The few years of mining experience which I have had in the camps of the Black Hills, Montana and Mexico have enabled me to come to a fair sort of conclusion as to what the upper Yukon river is really worth as a mineral country, and the following information is taken from a careful personal observation of the Yukon country:

Not one "mother vein" or "home lead" has yet been discovered on the Yukon river.

less on account of the small lead and great distances from the coast, Fort Reliance being nearly 1700 miles inland from the Behring sea-coast, or nearly 4000 miles from San Francisco. Thus, it certainly seems as if the Yukon interior of Alaska will never be a quartz-mining country.

But of placers—ah! the very strange anomaly exists of gold being found on nearly every pre-glacial bench or bar, and no real gold quartz yet found in the country!

I will assure, from actual experience, any miner who undertakes the first rudiments of rock and ground sluicing, that he can make fair wages on nearly any pre-glacial bar on the Yukon river above Fort Selkirk, though there is gold still below on the main river. The water is too deep and the yearly detritus increases too fast to allow very much success in bar-washing. The chief obstacle to placer mining, however, is the great difficulty in procuring

kan or Yukon interior. This part of the river freezes about the middle of September and thaws and opens about the middle of May.

Hotelinko river is the first actual tributary to the Yukon river. This river enters the Yukon about a mile below the mouth of the canyon and on the right or northeast bank. Sixty miles below is the second tributary, but there are several minor streams or creeks that intervene. The mosquitoes are actually abominable! Running along the current and by many islands and boulder bars, we arrive at the Bald peak. Far to the west is Lookout bluff. According to the Indian reports it is equidistant from the head of the east fork (the main branch) of White river and the Yukon. A wide chain of very rough and broken-up hilly country, heavily timbered, separates it from the Yukon river. The scenery now is many long, crooked heads, islands, snags and drift rafts, banded in by high sand bluffs. Running by a series of sand bluffs and scrub timber, we arrive at the Boswell gold bar. Here is the only mining camp on the entire 2500 miles of the Yukon river! I have named the great pre-glacial bar after the discoverer (Boswell, of Juneau, Alaska), whom I found working on the bar, with a series of rockers and the assistance of two white companions, Franklin and Madison, both of Juneau. He was waiting for the high water to go down so that they could get at the fine pay dirt on the edge of the lower rim rock of the bar. The silt would then be run through the rockers and the resulting black sand and gold dust would be washed out in gold pans over a mass of quicksilver, the latter absorbing the dust and allowing the black sand to be washed out. Boswell showed me some very fine flour dust, which he had in a sacking-powder can, about two ounces, and in six weeks from that time the party had taken out over \$2000 worth of dust. Of course, it was an exceedingly rich pay streak, which they might never find again on the Yukon, and they exhausted the strip of silt to deep water, which rendered the bar of no more value. The Boswell bar is situated on the east bank of the Upper Yukon river, about 75 miles above the Old Fort Selkirk and 560 miles from Chitca. The nearest fur-traders are at Fort Reliance, nearly 300 miles further down the river. The bar is surrounded by a dense growth of larch, birch and poplar. Considerable game, such as bear, moose and caribou and many valuable fur-bearing animals, black and silver foxes, lynx, etc., abound all through these upper valleys. The bar consists of small howlers and a fine gravel wash, in the concavity of a narrow horseshoe bend of about a mile in length. Its shape is like the segment of a circle, whose radius is about 200 yards. It is out of the direct current of the river and slightly above the mean level.

Only by carrying the pay dirt from a working streak to a series of rockers, can placer mining ever be made a success on the Tanana river, and even then, for nine months out of the year, the miner would have to relinquish his rocker and turn fur trader; and as the United States treasury laws do not allow any white man to trap or kill, for sale, any of the fur-bearing animals in Alaska, and as there are just enough fur traders on the river that the Indians require for the fur trade, it would not be a very paying investment for any band of able-bodied men to leave fair daily wages and come up to prospect these frozen regions. Certainly, they might make \$10 or \$20 per day to the man during this working season, and then again, they might not make 10 cents. But in the meantime, during the working season, first, they would have to be without half of the common necessities of life; second, constantly in danger from the Tanana Indians, who would be sure to be very jealous of them, and in all likelihood cause them much trouble; third, they could only work for three months out of the twelve, and the remaining nine months be compelled to do something else for a living; fourth, and something else in this bleak interior for a miner would mean nothing else; fifth, the profit thus made during the short working season would be more than swallowed up during the long non-working season; sixth, and lastly, the very great difficulty in getting self, tools and provisions into the country, and their extreme high cost, makes this Alaskan interior a very unfortunate mining country.

The Tanana river is distant from the head of canoe navigation on the Yukon river about 1400 miles, and about 1550 miles from Chitca, Alaska; and from the mouth of the Apuk channel, or northeast of the Yukon delta at the Behring sea, nearly 1000 miles. True for a little over 1000 miles, or to the lower rapids, the Yukon river can safely be navigated by any sized vessel that can enter the delta. Above this point it is not safe for a steamer to ascend this river any higher, although it is often done.

DISASTER AT TUSCARORA.—Tiding of a disastrous explosion at the Nevada Queen Mining Company's works, Tuscarora, Elko county, Nev., have been received. Superintendent F. F. Coffin telegraphed that a can of powder, used for blasting, ignited and caused a terrible explosion in the works. This was followed by the bursting of the boiler in the hoisting works, the latter explosion completely demolishing the building. The hoisting works were wrecked. Not a stick of timber was left standing. Five men were injured, and it is feared that their injuries will prove fatal, as several were badly scalded. Foreman Russell was among the unfortunates, and he is not expected to live.

SCENES IN LOS ANGELES COUNTY.

A GLIMPSE OF RIVERSIDE AND MAGNOLIA AVENUE.

There have been many surface veins and infiltrated seams of quartz, together with chimneys and blowouts of mixed hematite, galena, iron and copper pyrites and magnetic pyrites; some carrying free gold and native (malleable) copper have been found by the Indians and fur-traders on the Yukon, the head of White river and off toward the heads of the Copper and Tanana rivers. Small pieces of these ores find their way to the sea-coast, adjacent to these rivers, and excite a belief in the minds of the miners that the interior of Alaska is filled with seams and leads of rich quartz, when in fact there are only, after several years of careful exploration, three known seams of quartz on the entire Yukon river—the first at the Lava Cliffs, near old Fort Selkirk; the second at a small point, eight miles above Fort Reliance, and the third about 20 miles up the Novikaket river. All three are only chimneys or blowouts. Not a well-defined foot or hanging-wall has been found in any of them. The one at or near Fort Reliance has been slightly worked by the fur-traders at that post. Some of the ore, which is hematite, galena and copper pyrites, has been taken to San Francisco, and a careful assay made of it, and although paying ore if in a large enough body and near a mill, was value-

provisions and entering the country. This, coupled with the exceeding short interval between the leaving and the appearing of the ice in the river, makes it very difficult for any placer work. Hardly has a miner prospected a bar or gulch and got thoroughly to work, when the short season is at an end, and his water supply frozen up, and the intense cold during the winter months (70° below a Fahrenheit zero, and by a U. S. signal service thermometer at that), and the dread of that Arctic scourge, scurvy, with a possible short supply of provisions, compel the poor argonaut to either return back up the river and through the lake system cross the mountains to Sitka and Juneau via Chitca, or else descend the river to the first trading-post and drag out the long monotonous winter of fully eight months in absolute idleness, in company with the fur-traders. If a steady supply of provisions could be depended on at these fur-trading posts, it would be very different, but as they only have enough civilized food—beans, flour, bacon, etc.—for themselves, the miners must either bring in enough provisions of their own or else return to Chitca in disgust. This is, without any exaggeration, the cold drawn facts in regard to the mining resource of the valley of the Alas-

Passing Events.

The election which took place on Tuesday resulted in the defeat of the proposed amendments to the Constitution of the State as far as related to the Judge of the Supreme Court and their salaries. The new charter for San Francisco was also defeated. At present writing it appears, however, that Amendment No. 3, relating to the charters of cities, was carried. This gives towns of certain size the privilege of framing their own charters.

From all parts of California come notes of enterprise and progress. Values are appreciating everywhere and the State is really entering into an era of progressive prosperity.

It is evident that there will be a boom in quartz mining in California this year. Prospectors are at work in the hills in all directions, and the mines that are already opened are being developed with vigor. The use of water-power in mining operations is making a great difference in the profits of many enterprises.

A good many miners are going to Alaska, attracted by the reports of new placers on the Yukon and Stewart rivers. A couple of hundred men went up on the last steamer. The mining season in that Territory is short.

JOHN SUTHERLAND, the popular and highly-esteemed superintendent of Wm. T. Coleman & Bro.'s Niagara mines and mill in French Gulch mining district, Shasta Co., died last week.

A QUARTZ LEDGE was discovered on the 7th inst. near Grass Valley by men who were digging post-holes.

Debasing the Bullion.

The method of calculating the bullion product of certain of our Pacific States and Territories that has of late years come into vogue, is one that seems to call for correction. Under this method all the copper and lead made in these countries is classified as bullion. Thus, the State of Colorado is reported to have turned out last year bullion to the value of \$25,000,000; creating the impression that her mines yielded that much gold and silver, whereas their yield of these metals did not exceed \$16,000,000 or \$17,000,000. So, also, the bullion product of Montana, Idaho, Utah and Arizona is set down at fully one-fifth more than it actually amounted to.

Now, this plan of calling copper and lead bullion is objectionable for two reasons: first, being a subversion of the truth, it tends to mislead the statistician as to the additions that are annually being made to the present stock of the precious metals; and secondly, it does an injustice to other countries, which, like California, Oregon and Dakota, produce only, or mainly, gold and silver. Under this system it goes out to the world that there was produced in the countries west of the Missouri river last year bullion to the value of \$100,000,000, whereas it amounted to only about \$80,000,000. This is clearly wrong. It is, in fact, propagating a falsehood. The raising of lead and copper to the dignity of the royal metals was effected, in the case of lead in 1870, and of copper, 10 years later. The value of their annual product at the time they were so ennobled amounted to only about \$1,000,000 each, their joint value being now nearly twenty millions. They should be relegated to their former status and there suffered to remain. They are not bullion; that consists of uncoined gold or silver, not pigs of lead or copper. As well call coal and iron bullion as these coarse metals, and concede to Pennsylvania the honor of being the greatest bullion-producing country in the world.

Through this gross perversion of terms California has been deprived of her well-earned and still merited supremacy as a bullion-producer, her annual output of gold and silver exceeding that of Colorado, to which this distinction has lately been so unjustly awarded, by several million dollars. She turns out some copper—a thousand tons or so annually; also, considerable quantities of petroleum, salt, quicksilver, borax and lead. But she has never accounted these precious metals, nor has she used them to magnify her apparent product of bullion.

ALASKA MINES.—B. W. Cowles, a mining man of Alaska, arrived here on the last steamer. He has the following to say of the mines of the Territory: "Senator Jones' Treadwell mine on Douglas island is working about 160 men. It is understood that they have lots of good ore. Some miners on the island, I don't know who they were, three weeks ago sold to a London company a property for \$1,000,000. A 200-stamp mill is to be put up there. A 160-stamp mill is in course of erection on the island on the Nowles property, owned by a Boston company. It is safe to say that within the next 12 months there will be more than 600 stamps at work on Douglas island. I suppose there is nothing like the ledges there in all geology. They are from 400 to 500 feet wide, and are low grade, mining from \$6 to \$14 per ton. There is a good deal of excitement now on the Yukon now, and at Berner's bay, 40 miles above Sitka, rich placer and quartz properties are reported found. A good many prospectors have gone in. The steamer Ancon, that left Port Townsend last Wednesday, carried up about 200 miners, principally from Montana and Washington Territory."

It is claimed that the Milton Mining and Water Company and the Gowell Mining Company have violated the injunction of the United States Circuit Court restraining them from carrying on hydraulic mining, and are guilty of contempt. S. C. Houghton, Master in Chancery of the United States Circuit Court, left Wednesday for Nevada county to investigate the matter.

A 40 TON FURNACE is being built at Spruce-mont, Nev. It is proposed to put the furnace at work on ores from the mines of that camp as soon as possible, and the future of Spruce-mont is considered quite favorable.

Reducing Ores of Nickel and Cobalt.

Commercial nickel, even when tolerably free from impurities, cannot be well welded, hammered and drawn, because the metal, when in a molten condition, absorbs oxygen and retains the protoxide thereby formed. A German inventor, Fritz Lotter, of Altena, Westphalia, has devised a means to avoid this evil and produce the metal in such form that it can be worked.

He so manages the reduction of the ores of the metal that a certain percentage of metallic manganese may be formed and left with the reduced nickel, so as to absorb the oxygen when the alloy is worked, and prevent the formation of the objectionable protoxide of nickel.

The oxides of nickel and cobalt, free from injurious impurities, are reduced to powder by the ordinary means, and mixed intimately with powdered oxide of manganese, in proportions to be determined for each case, after which the compound is formed into cubes or cakes in the same manner as is usually practiced with the oxides of nickel and cobalt.

The ordinary proportions are one part of oxide of nickel with from 2½ to 3 per cent of oxide of manganese. The compound is then formed into cubes or cakes which are placed alternately with layers of charcoal powder into refractory crucibles, the whole being finally well covered with charcoal powder and exposed about four hours to a temperature of the point of fusion of metallic nickel which ranges from 2500 to 3000 Daniel's pyrometer. Care must be taken that the temperature does not reach above the degree named, so that the metal may not be fused.

After the crucibles are cooled and the metallic cubes are separated from the charcoal and scorched or cleaned, said cube nickel contains yet about 1½ per cent of metallic manganese mixed with it. In melting this cube nickel containing manganese, either alone or combined with other metals, the manganese will absorb the oxygen which would otherwise combine with the melting nickel or cobalt, and thereby a nickel or cobalt free of oxide or a composition free of protoxide of nickel or cobalt can be obtained. Therefore the melting process must be managed in such a manner as to remove most of the manganese, but to let remain some small traces of it in the melting nickel, in order to prevent the latter from absorbing the oxygen.

In such melting process a small portion of glase or borax will serve to take up and bind the oxides of manganese that form and separate themselves, and they may be removed in the form of slag. The remaining metal then is to be molded in convenient castings. The melted castings or cubes of nickel and cobalt thus produced always contain small traces of manganese—say one-quarter to three-quarters per cent. This small percentage of manganese which is left in the nickel cubes serves until the melting process is finished, to prevent the absorption of oxygen, and is not at all detrimental to the final working of the metal. These melted nickel cubes are exceedingly pure, dense and ductile, possessing a very bright luster, and may be welded, rolled, hammered or otherwise worked. They may be alloyed with other metals—say with copper and zinc, for producing German silver—and will confer their qualities upon such compositions and improve their luster and ductility.

As above mentioned, the reduced cube nickel not yet melted—containing about one and a half per cent of metallic manganese—as obtained by the first operation of the process, is adapted to be used in metal composition, instead of nickel or cobalt, which is wholly free from oxides, for the reason that the manganese present at the melting will absorb oxygen, which would combine with the nickel. When it is absorbed by the manganese it can readily be separated from the composition in the form of slag. As these compositions rarely contain more than 30 per cent of nickel, they consequently will contain barely one-fourth or one-half per cent of manganese—an amount that will not at all interfere with the working of the composition metal.

DR. J. W. HOFFMANN, of the American Bureau of Ethnology, has been named by the King of Portugal a Chevalier of the Order of St. James, one of the most ancient Orders of Christendom. Dr. Hoffmann is well known on this coast, where he resided many years.

Who Oppose the Free Coinage of Silver.

There was turned out last year in the principal bullion-producing countries of the United States \$31,000,000 gold and \$54,000,000 silver. By reason of the fiscal policy adopted by our Government, silver has been practically demoted in this country. That in pursuing this course the Government has grossly blundered, is becoming every day more and more apparent. What renders this blunder the less excusable is the fact that these public authorities appear to have been led astray by the creditor classes and the money-changers, if they have not been guilty of playing directly and purposely into their hands. It is not simply a mistake, but it seems almost criminal that silver, from the earliest historic times accounted a royal metal, and to-day the favorite coin of more than two-thirds of the human race, should have been robbed of its money function and in this wanton and summary manner debased to a mere commercial commodity; and this, not because the public good required that this metal should be so ostracized, but because its demotion tended to promote the interests of the lenders and the insurers, acting in concert here and elsewhere, this policy having been largely dictated abroad.

We have not now, nor have we ever had, a plethora of silver in the United States. It has always circulated freely, having been the preferred money of the masses. California is not largely a silver-producing country. Our bullion consists mainly of gold, wherefore this discrediting of the cheaper metal does not hurt us materially. But we try to be American enough to take in the good of the whole country, regardless of local prejudices or class interests, especially where these interests are foreign. This is quite a large country, and, as it turns out more than half the bullion produced in the whole world, we might perhaps venture to adopt, in this matter of remonetizing silver, a policy more distinctively American, even at the hazard of giving offense to the bankers and brokers of London, Paris and Berlin. We would indeed be loath to incur the displeasure of these courteous people, but when it comes to weighing out silver instead of coining it, we object. These money-changers and the whole world are at liberty to buy and sell lead, copper and antimony by the pound, quicksilver by the flask, or, as our English consuls have it, by the "bottle," coal by the ton, potatoes by the bushel and wood by the cord; but when it comes to handling our silver we prefer that it should be coined into dollars and pieces of smaller denomination, each bearing the image and superscription of these United States. This is an honest money and ought to pass current at its face everywhere. And it would, did not our own Government dishonor it in their efforts to favor "gold bugs" at home and monometalists abroad. It is time that we have in our fiscal matters another "Declaration of Independence."

Mining Accidents.

At Bullion, Idaho, on Saturday, Thomas Walker and Archie Watson were killed in the Idahoian mine by a blast. They were extracting an unexploded charge in an old drill-hole. Walker was killed outright and Watson lived five hours.

A Chinese miner at Alpha, Nevada county, put a giant powder cartridge into a stove to thaw it out. An explosion occurred and the Chinaman and his cabin are missing.

Gus Trees, a miner, was instantly killed on the 9th inst. while at work in the Graphic mine, Magdalena district, N. M., by a premature explosion of giant powder. He was horribly mangled.

John Daniels, who had his skull fractured at the Pittsburg mine, Nevada county, recently, is getting along well.

Wm. Clemp was badly bruised by a rock falling on him in the Providence mine, Nevada county, but no serious results are anticipated.

ENGLISH COKE is scarce here at present. It is now worth about \$20 per ton. The present monthly consumption is about 2200 tons. We imported 26,293 tons last year. A great deal of this coke is shipped by rail to the various smelting works on the coast, and considerable is used by local foundries.

SAN BENITO OIL FIELDS are claimed to be the best yet discovered on the Pacific Coast.

The March of Improvement.

There is scarcely a city or town in California which is not now showing a desire to keep pace with the march of improvement and progress. On all sides steps are being taken to develop the natural resources and to build up manufactures. Railroads are being built in all directions and others are being planned. The principal towns are planning or building cable or electric street railroads and otherwise improving their surroundings. New hotels are being built and new towns are being laid out. For a time this marked enterprise was mainly confined to Southern California, but it has now spread all over the State. Many new settlers are coming in and lands are advancing greatly in value. We append a few items of interest which show how general are the steps being taken to improve affairs in California.

The Board of Public Works of Los Angeles have recommended to the Council, and the Council have granted, franchises for two new cable railroads in that city. One of these was granted to the Los Angeles Development Co. and the other to J. G. Crank and Herman Silver. All the horse-car lines in the city are to be transformed into cable roads.

The citizens of Visalia and Tulare are about to join the two places together by a street-car railroad. The cars are to be run by a dummy engine. Application has already been made to the Board of Supervisors to grant a franchise for the roadway.

The Kern County *Californian* states that owing to the difficulty of procuring white labor, the railroad contractors in Southern California have raised the wages paid by them to \$2 a day. Board costs \$4.20 a week. Apropos of this, nearly every town in Southern California complains of the swarm of tramps and vagrants.

The State Board of Harbor Commissioners have decided to build another 1000-foot section of the San Francisco seawall. The cost is placed at \$134,970. The contractors agree to have the entire wall and wharf built in 12 months and not to employ Chinese labor, under a penalty of forfeiture of the contract.

Arthur Brown, of the railroad company, is busily at work on plans for the new Del Monte hotel, at Monterey. Work will be proceeded with at once.

The Colton *Semi-Tropic* says: Every idle man in the country can get employment on the great railroad and ditch works now going on in Southern California, and there is now no good excuse for an army of tramps and beggars.

At a meeting of the Italian Chamber of Commerce, held at 506 Battery street, San Francisco, communications were received from Italy, asking that samples of Californian canned fruit and canned salmon, and also matchboxes, be forwarded to Italy for exhibition in the Commercial Museum of Milan and Turin. The split-wood match is as yet unknown in Italy.

Major W. H. Loler is organizing a company to build a tube from Los Angeles to Pasadena, through which passengers and packages will be forced by pneumatic power.

At San Jose, an electric railway company has been granted a franchise by the Council to operate a double-track road on Santa Clara street, to be commenced in 60 days and finished in six months.

The Colton motor road is to be extended to Arrow Head Springs as soon as the rails can be procured.

The San Francisco Board of Supervisors have passed to print a resolution granting permission to the Telpherage Electric Railway Company to place and maintain, until Aug. 1, 1887, a steam plant of ten-horse power on premises at the northwest corner of Foley and Twenty-fifth streets, for the purpose of generating electricity to be used as a motive power on the cars of the North Beach & Mission railroad.

A new plant for the Gas and Electric-Light Company of San Diego has arrived in that city. It is six times the capacity of the plant now in use.

Eight electric-light poles will be erected by the gas company, which recently purchased the plant of the Thompson & Houston Company at Santa Rosa. Most of the lights will be on Fourth street, and those around the plaza will be 60 feet high.

In connection with the Southern Pacific Railroad Company's purchase of 55,000 tons of steel rails, a great many thousand tons are to be used in extending the Mexican International

road from Monclav, Mexico, to Lerdo on the main line of the Mexican Central. When this is completed the Southern Pacific will have the shortest line between the City of Mexico and New York. Connection is also to be made with the Mexican National by building from Monclav to Sotillo, Mexico.

The coast collieries are reaping a benefit from

about 30 miles. If it be extended to the coal fields, five miles south of Livermore, it would be of incalculable benefit and furnish an unlimited amount of cheap fuel for the proposed factories and domestic use.

The recent reduction in rates from this city to Western Colorado seems to have done much to increase freight shipments to that Territory.

Fig. 5.—RICHARDS' PATENT COMPOUND NON-CONDENSING ENGINE.

the low price of tonnage just now. The idle vessels are glad to get coal freights in the coastwise business.

It is reported that the San Francisco & North Pacific Railroad Company (narrow gauge) has commenced to build an extension of its

Previous to the Interstate law, all freight for Colorado was sent to Denver, and was then distributed to the other portions of the State.

Now, however, in consequence of the operation of the long and short haul clause, the outlying portions of the State receive San Francisco

Fig. 6.—RICHARDS' PATENT PIT PUMP.

road from Markham's mill on the north side of Russian river to a large belt of redwood timber on Willow creek. There is in this body of timber over 40,000,000 feet.

The proposed survey of the Southern Pacific Company for the railroad from Martinez to Livermore through Green, San Ramon and Taffajara valleys, will traverse one of the most fertile sections of the State. The distance is

freight cheaper than Denver does. The reduction in rates to Nevada and Utah will, it is thought, do much to build up the trade between these points and San Francisco in commodities hitherto imported from Chicago and the East.

THE rumor that there has been trouble at the Anaconda mine, over the wages question, is denied. The smelter is running full blast.

Richards' Patent Hydraulic Machinery.

NUMBER 3.

In the accompanying engravings Fig. 5 shows a smaller engine, with cylinders equal to 6½ and 10 inches diameter, without condensing apparatus.

In these engines the valves are driven from an overhung crank, dispensing with the common eccentric. The valve-rod is removable at the top, by means of a single screw, so the valve-box cover can be removed without obstruction, the valve-slide seen on the outside coming away with the cover and causing no inconvenience. It may also be mentioned that the valves can be set and adjusted without opening the valve-box, a peculiarity of engines arranged in this manner.

The next machine we illustrate, in Fig. 6, is a pit centrifugal pump, to raise water to 100 feet high. These pumps are made on the same principle as those previously described, but with very different proportions. The casing is heavier, and the runners, or wheels, of large diameter. They are very simple in construction and can be readily put together or taken apart in place. The driving-shafts are independent from the top, and so arranged that their weight cannot in any case rest on the runners.

The different sections of shaft, when two or more are employed, are connected by removable clamp couplings, so constructed that the shafts cannot slip or draw out of the couplings and rest on the pump-pindles.

These pumps are the result of a wide experience in this class of pumping, and are a great improvement in simplicity and first cost over the compounding plan which has been tried and abandoned in both England and France. The present pump is in many respects similar to the "Farcot" system, on which pumps are made to work against a head of 30 meters (108 feet) and attain an economical duty. The air-vessel and valves are contained in one chamber, thoroughly accessible and arranged to protect the pump from water shock.

Foundry Notes.

The winding machinery for the new Powell-street cable railroad is being made at the Riedon Iron Works in this city. There are to be four engines, 22 inches in diameter and 48-inch stroke. They have the latest improved automatic Corliss valve gear, and are similar in construction to the engine built for Senator Fair's cable road in Oakland. The spur-wheels will be 14 feet in diameter and 23 inches face. The winding reels will be 13 feet 9 inches in diameter. This machinery will wind three separate cables, which will be run at a speed of eight miles an hour—faster than the other cable roads in the city. There are to be six horizontal tubular boilers, 54 inches in diameter and 16 feet long, made of steel. The plant will have Llewellyn steam-beaters and Hooker feed-pumps, and it is believed that when complete will be second to none in the city or elsewhere.

The new North Star quartz-mill, in Nevada county, just completed by these works, is believed to be the most complete and perfect gold mill on the coast. It may be well to state that the machinery for the mill was designed as well as built by the Riedon Iron Works, although the credit for the designing has been given to other parties by some of the newspapers.

The new pumping engine for the station of the Spring Valley Water Co., at Black Point, has been formally accepted from the Union Iron Works, the builders. The engine is 250-horse power, with low pressure cylinder 42-inch diameter, and high-pressure cylinder of 22-inch diameter, 44-inch stroke. The fly-wheel is 18 feet in diameter and weighs upward of two tons. A great saving of coal has been effected by the use of the new machinery, as proved by a few weeks' practical test.

There are two new boilers with the plant, one of which is a Babcock & Wilcox of 250-horse power. The other is a 200-horse power Hazleton, built by the Pacific Iron Works, Pacific Coast agents. We recently described and illustrated the boiler in the PRESS. It seems to be meeting with great favor here. It makes steam quickly and economically and occupies little floor space.

The new steamer for the South Pacific Coast Railroad Co. will be ready for launching in about a month. She is 235 feet long and will be used on the Oakland ferry line. The motive power was designed and built by the Fulton Iron Works. It is a beam engine with cylinder 50 inches in diameter and 10-foot stroke. These same works have also designed and built engines, etc., for the new steam schooners for the lumber trade on the coast. One of these is for the Fort Bragg Lumber Co., and the other for the West Coast Lumber Co.

MECHANICAL PROGRESS.

Hot Journals.

We clip the following notes on hot journals from data given by Joshua Rose:

If a hearing and journal have once run cool, they will always run so under the same conditions. Or if similar hearings have been made to run cool on other like, or rather duplicate machines, the trouble may be traced to the lubrication, the workmanship, or the adjustment.

When a journal heats there is some direct mechanical cause for it, which, in nearly all cases, lies so near the surface that it may easily be discovered.

In a new design of machine it may arise from improper designing, such as too little bearing and journal area, or the springing or bending of the shaft, improper or insufficient lubrication, faulty material, bad fitting of the hearing to the journal, improper adjustment of the hearing, or want of correct alignment.

Heating from faults of design is not that which troubles the engineer permanently, because it forces its own correction, and furthermore, the principles of correct journal and bearing design are so well understood nowadays that such errors are comparatively rare.

In the matter of lubrication it is pretty well acknowledged that, although the light and mineral oils may answer for many purposes, good lard or sperm oil will answer for almost every purpose of journal and bearing lubrication; hence, where the journals give any trouble, a resort to sperm or lard oil is generally one of the first expedients. The employment of plumbago, sulphur, etc., is simply an expedient that may be stated as being irregular, or, perhaps better, as unprofessional practice. Not that such expedients may not be of value in exceptional cases, but rather that those cases are regarded as having no business to be exceptional.

In the matter of the material it is now conceded that a cast-iron hearing will work well with a journal composed of any metal whatever, whether chilled, hardened or soft, provided that the pressure per square inch of its bearing be within certain limits. These limits Prof. Thurston and Mr. Coleman Sellers state respectively as being not over 50 or 75 pounds per square inch.

"Composition brass" will always make a hearing that will run cool under a maximum of load, provided the mixture of metal is such as to properly come within the limits of what the term "composition" is supposed to imply; but the extra profit gained to the molder by the employment of a good deal of zinc and of very little tin makes the ordinary "composition brass" a very doubtful metal. What is known as gun metal is a little more, though not entirely, reliable, the defect being in nearly all cases an insufficiency of tin.

Heating sometimes occurs from the bearings not bedding fully to the journal, but when this is the case the self-correcting tendency or wearing down to a bearing, as it is termed, proceeds rapidly. But it is not to be overlooked that "wearing down to a bearing" is another term for letting the parts that should have been fitted out themselves to a fit.

A hot journal is often produced by too close a fit or adjustment of the hearing to the journal, which does not afford sufficient room for the oil. The degree of fit that will not heat and yet have no play is that attained when the shaft will rotate as easily with the cap screwed home as it will with the cap loosened. In the case of heavy shafts, however, it is difficult to test the fit in this way, but it may be adjusted by placing red marking on the journal, screwing home the cap, and easing the fit until, with the cap screwed home and struck with a block of wood and a hammer, the marking on the journal does not transfer to the cap bearing area.

A very common cause of the heating of journals having brasses, and boxes composed of two halves, is that both halves alter their shape from cause attending their wear. Thus most engineers will have noticed that although there is no wear between the sides of a brass and the jaws of a box, yet in time the brass becomes a loose fit in the box. Now since the sides of the brass have, when fitted, no movement in the box, it is evident that this cannot have proceeded from wear between those surfaces, and it remains to find what causes this looseness.

Most engineers will also have observed that though the bottom or bedding surface of a brass end of the box may have been carefully filed to fit each other when new, yet, if in the course of time the brasses be taken out and examined, and more especially the bottom brass that receives the weight, the file-marks will have become effaced on all parts where the surfaces have bedded together well, the surface having a dull bronze and condensed appearance. This is caused by the vibrations under pressure having condensed the metal. Now this condensation of the metal moves or stretches it, and causes the sides of the brass to move away from the sides of the box, and consequently to close upon the journal, creating excessive friction that may and very often does cause heating.

It is for this reason that on such brasses the sides of the brass boxes are, by a majority of engineers, eased away at and near the joint, and it follows from this cause, the same easing away is a remedy.

This brings us to the advantage of babbitt

metal for bearings. In the first place it dispenses in many cases with the brass or separate bearing piece, and thus avoids the evils pointed out as attending the employment of brasses. In the second place it will conform readily to the shape of the journal, hence need not be so accurately fitted, and is not so liable to cause heating if improperly fitted or bedded.

HAMMERING CIRCULAR SAWS.—Is there an exact science in hammering buckled steel saw-plates straight, or is it managed by a well-focused judgment, heeded by phenomenal mechanical instinct and large wages? This question is answered by a cotemporary as follows: "Every science, properly so called, is an exact science. Hammering buckled steel saw-plates straight is particularly an exact science, as any inexperienced person will find who may have the curiosity to try a 60-inch saw that is buckled badly, and undertake to make it 'as straight as a die.' We have met a large number of men who have first-class skill in hammering saw-plates to the required condition to produce the best results. There is nothing phenomenal in their appearance or actions. They belong to the genus homo, and if not possessed of too much self-esteem will tell you that the principles of their art are very simple. Practice soon teaches them the 'tight' places, which they hammer, thus stretching the metal and producing an equilibrium of tension throughout the plate. Special anvils and hammers are necessary for large plates, and the practice and judgment required to do first-class work is not greater than is necessary in hundreds of other industries. Circular saw-plates are first straightened, and are then hammered to give the rim a tension to resist 'centrifugal force' and the strain and heat developed when cutting in the log at high speed. Saw-makers frequently fail in making this rim tension the exact degree required for all purposes, and on this account they do not always 'stand up' in sawing very hard wood."

HOLLOW VS. SOLID SHAFTING.—Although a shaft made in the shape of a tube is stronger than it would be if made of a solid bar of the same dimensions, it does not follow that a solid shaft is increased in strength or better prepared to stand a sudden twist if a portion of the material is bored out along its central line. Frequently workmen entertain the idea that the core of an axle or the bearing of a shaft is a hindrance in the way of strength, and is one of the reasons for making them hollow; this is not so, as it is merely the arrangement of the material that improves its strength. Boring out a solid shaft lessens both its weight and its strength, but the material is removed from the portion where the least resistance is offered; therefore the loss of weight is greater than the loss of strength. The particles on the outer surface are tested to their utmost when those in the center barely receive any action at all, and from this line to the circumference they are gradually being brought into use until those on the outside are ready to break apart when the limit of strength is reached. In tests that have been made, results have shown that the weight may be reduced 16 per cent by boring, while the strength would not be lessened by more than $\frac{1}{2}$ or 2 per cent. The success of many designs lies in so arranging the material that where any fracture is likely to occur, as much metal may be used as is likely to be wanted to stand the increased strain.

A TON OF COAL.—Chemistry has revealed much that enables us to agree that there is more in a ton of coal than is obvious. Besides gas, a ton of gas coal will yield 1500 pounds of coke, 20 gallons of ammonia water, and 140 pounds of coal tar. Destructive distillation of the coal tar gives 69.6 pounds of pitch, 17 pounds of creosote, 14 pounds of heavy oils, 9.5 pounds of naphtha yellow, 6.3 pounds of naphthalene, 4.75 pounds of naphthol, 2.25 pounds of alizarin, 2.4 pounds of solvent naphtha, 1.5 pounds of phenol, 1.2 pounds of aniline, 1.1 pounds of aniline, 0.77 pounds of toluene, 0.46 pounds of anthracene, and 0.9 pounds of toluene. From the last-named substance is obtained the new product known as saccharine, which is 230 times as sweet as the best cane sugar.

BUYING A BOILER which figures up largely in heating surface is one thing, and getting good evaporative results from this surface is quite another thing. It was supposed by many persons some years back (and is supposed yet by some) that the more tubes you could crowd into a steam boiler, the better "steamer" it would be; but time and experience have proved to manufacturers that free circulation of water in the boiler is much more important.

TRANSMITTING STEAM-POWER.—Within the limits of heating and shafting overhead, or shafting in any direction or all directions, underground power may be readily transmitted; but when the attempt is made to send steam for power or for heating, it is quite probable that it will be found economy to make the coal into gas and transmit that to points to be consumed under boilers and water-heaters to supply steam on the premises.

THE STEAM GAUGE.—Locate the steam gauge in a good light and keep its face clean, so that it will not require an electric light, a step-ladder and a telescope to tell where the needle points. Have it tested occasionally, that you may know if it is in proper working condition.

SCIENTIFIC PROGRESS.

The Progress of Science.

The Origin of Life—Vital Force.

Dr. J. B. D. Stillman, in his introductory remarks to "The Horse in Motion," published under the auspices of Hon. Leland Stanford, says some good things in regard to the origin of life and vital force which will well repay perusal, or re-perusal if they have been read before. We copy a portion of his introduction, as follows:

The progress that science has made in every department, and is still making, is wonderful; and who can say where it will end? But in the knowledge of the laws which govern the origin of life, the vital organs and their functions, of the nature of that force by which one form becomes altered or modified by the altered conditions of its life, it has made no progress since the days of Job.

The whole question of life and vital force is still a great mystery, although it is receiving at this time the concentrated attention of the most intelligent naturalists of all nations. There are not many who deny that organic forms may be modified within certain limits by artificial means. There are many who believe that all organic beings, of whatever nature, had their origin in the most rudimentary element, as a cell possessing certain inherent tendencies to develop by aggregation into other and higher forms, unequally modified in various ways by surrounding influences, with a tendency to variation by imperceptible degrees in every direction, the useful variations favoring the existence of the individuals possessing them. This idea has become familiar under the terms of "natural selection" and "survival of the fittest." This hypothesis does not presuppose design and denies a Creator. Under the name of "Darwinism" it has become popular and invaded all ranks. It found the soil of Germany especially fitted for the propagation of a theory of such an atheistic character, and it was proposed at a meeting of the Society of Naturalists at Munich, a few years ago, to teach it in the national schools. It has become so generally diffused in our own scientific circles that a reference to a Supreme Being in an essay read before a society of naturalists would be considered to be a poetic license, if one had the courage to make it, and nature is usually personified to meet the necessity. We have long been familiar with the reference to the laws of nature, and we now begin to bear of the laws of evolution. In all ages there has been a tendency on the part of the masses to follow some leader whom they desired to do their thinking for them; to pin their faith to his, or what they supposed to be his. It is no less so in the scientific circles than in the religious. Dogmatism seems to be leaving the latter to attach itself to the former; at all events, it is inherent in the human mind. No person is utterly free from it, and to appeal to the opinions of those whom we believe to be better informed rather than to examine the foundations of these opinions has been the vice of all ages.

It is well known that faculties and functions are strengthened by use, and weakened, or altogether lost, by disuse. We shall look in vain for proofs of an organ changed in the mechanical principle of its construction, or one evolved by imperceptible degrees where none existed before; but we shall, on the other hand, find proofs in anatomy that the changes could not have been gradual. Every stable-hoy knows that qualities are transmitted by heredity, and that desirable ones may be bred by judicious crossing within certain limits; and he knows as much as any one of the force or influence by means of which this is brought about. Speculation should not be confounded with science, as was said by Virchow, or science will lose its claim to the respect of mankind; and this whole question of evolution is speculative when carried beyond proof; and sciences, when it crosses the vital boundary line, is lost in speculation. We know that organic matter is subject to physical laws like other matter; it is attracted by the earth, and will fall with a force as great as if it were inanimate, and is equally subject to the law of falling bodies. It acquires momentum, and its momentum is equal to its weight multiplied by its velocity, the same as that of a railway car or a cannon shot, and when vitality leaves it, it is resolved to its original elements, oxygen, carbon, etc., which the chemist can prove by analysis. But has the most skillful chemist ever been able, by synthesis, to restore the lost element—the vital spark? Has he ever been able to imitate the products of that vital laboratory, the stomach, and form the aliment that replenishes the blood?

With all the knowledge of physics ever acquired by man, can he make a pump so perfect as the heart, that organ which forces the blood, loaded with fresh sustenance, to every part of the body? And what does he know of that power that has kept it in alternate action and rest every instant since before the earliest memories of his childhood?

He has been familiar with the laws of optics for centuries, and has made instruments of glass and metal in imperfect imitation of the eye of an animal to exalt the powers of his own vision; but what would not an optician give to be able to construct a concentric achromatic lens, with automatic power to adapt itself to the distance of objects, such as the eye of the lowest vertebrates?

Aesthetics is another of the physical sciences of which man is a professor, and he has just invented an instrument by means of which he can communicate, in ordinary vocal sounds, to a person miles distant. He has recently invented another by which he can register and preserve the intonations of his voice, to be returned to him at will at any future time; but that most wonderful instrument, the ear, he can only wonder and admire. Without it the world would be without music, voice or sound; the faculty of speech, our consciousness, memory, imagination, affection—but it is needless to multiply this class of facts. In nothing does man show himself to be the creation of an intelligent power more than in his own creative faculty. How great have been his achievements in mechanics! But what comparison does the highest bear to the locomotive apparatus or machinery of a horse, with its compound system of levers, pulleys, tendons, springs and muscular powers, and that marvelous ingenuity in arrangement to produce results which man has not been able to understand until now, and all set in motion through telegraphic communication distributed to every muscular fiber, and the whole of this complicated system of organs, co-ordinated and controlled by one central will?

Another incomprehensible mystery of life is that this complicated machine should possess the power not only to preserve and protect itself through a long life, but of reproducing from generation to generation indefinitely, and transmitting to posterity its own peculiarities of form and mental qualities!

Does the whole organic world furnish no proofs of intelligence and design, that we must be told that all these marvelous manifestations of both are but the inherent properties of matter,

"And that were true which nature never told?"

If it were an "attainment end an aim" to escape moral responsibility by getting rid of a creator, do we approach any nearer the solution of the question of the origin of life by removing it farther off into the mytho-geological eras? Or is the difficulty in any way diminished by attributing to matter all the high intellectual functions that have been, by un-schooled people in all ages, ascribed to supernatural powers?

Can the microscopist, when he discovers vibriones in a vegetable infusion, or protoplasm in a drop of serum, be excusable for running naked, like the philosopher of Syracuse, through the streets, shouting "Eureka!"? Can one who finds a shingle or a brick, claim that he has discovered the cause of a house? Let him account for the origin of the brick and the shingle!

Because the skeleton of a four-toed horse, which failed to connect his species with our time, has been found in the fossiliferous deposits of the interior of this continent, does it follow that our noble soliped had an origin less remote and independent, or that he found it necessary and practicable to concentrate his four toes into one, or succumb to the altered conditions of his life?

All science, in whatever department of knowledge, is retarded much by the ignorance and zeal of the multitude who follow on the heels of genius. Medicine has its mountebanks, who are dragging a noble science into contempt; religion has its harlequins and natural science its buffoons, who as itinerant lecturers perambulate the towns as representatives of learning they do not possess, and put forth as proved truth the wildest speculations of enthusiasts and call them science. It is very common to hear of the origin of man from the ape, as if the relation were a scientific truth, when, in fact, it is only a speculation; and all the evidence so far collected from fossil remains as early as the tertiary deposits, gives no confirmation to the speculation. As far away as any trace of the prehistoric man has been found he was as perfectly developed as he is to-day, and as far removed from the ape.

Darwin is not responsible for what is known as Darwinism. He is a model for a naturalist, collecting facts and placing them in their relation, drawing his conclusions cautiously, and candidly admitting the difficulty when a fact antagonizes the hypothesis he is framing. Not so with his zealous disciples, who rush to their desired conclusions over his facts as the fanatical Christians of Alexandria did over the last vestal altar of Greek philosophy.

Organic life is the result of either chance or design; there can be no middle ground. If the latter, the question of how it was brought about will never be solved by man, nor is it important that it should be. It is sufficient that a Supreme, Intelligent Will is the author and sustainer of all—a beneficent Spirit, who

"Grows in the sun, refreshes in the breeze,
Glows in the stars, and blossoms in the trees,
Lives through all life, extends through all extent,
Spreads undivided, operates unspent."

Who has endowed us with faculties to admire the beautiful, the good and the true, to know why so many things are as we see them, but none to know how.

THICKNESS OF HUMAN HAIR.—Measurements have shown the thickness of the human hair to vary from the two hundred and fiftieth to the six hundredth part of an inch. The silkworm's thread is one five-thousandth. Blonde hair is the finest and red the coarsest. Taking four heads of equal weight, a patient German physiologist found the red one to contain about 90,000 hairs, the black 103,000, the brown 109,000, and the blonde 140,000.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ADDING MACHINE.—Brainard F. Smith, Sacramento. No. 390,118. Dated March 29, 1887. This adding machine is a combination of devices, somewhat difficult to describe clearly without the aid of engravings. The inventor claims several improved features over those machines of ordinary construction.

CHROMATIC PRINTING APPARATUS.—Fairfax H. Wheelan and Albert Schurch, S. F. No. 360,185. Dated March 29, 1887. This invention relates to certain improvements in chromatic printing so that two or more colors may be printed at one impression. The apparatus consists in the construction and combination of devices.

FRUIT JAR.—Delmas E. Ashby, S. F. No. 360,131. Dated March 29, 1887. This is a fruit jar having an elastic packing fitted into a depression or channel around its top and a groove or channel around its outside below the top, a thin perforable metal cap resting upon the elastic packing, and a heavy sheet-metal rim fitting over the cap and having a flange turned down and indented or fitted into the exterior groove or channel of the jar.

Locomotives of To-day.

A machinist in the Southern Pacific shops at Sacramento was in this city recently. He stated to an *Examiner* representative that he had returned only recently from a trip East and a visit to the Baldwin Locomotive Works at Philadelphia.

"There is a growing demand," he said, "for heavier and stronger engines that will be able to draw heavier trains at a higher rate of speed. Those in general service are light and not fitted for the heavy work required of them. Railway managers as a stroke of economy are coming to the conclusion that heavy trains lessen expenses as against light trains and many of them."

"Freight will be carried more expeditiously in the future. The engines in use for freight service are constructed for strength and not for speed. Their drive-wheels are much too small for quick travel. Not many more of this order will be built except they are for mountain work."

"While the railway managers are anxious to meet the demand, they are unwilling to relay their road with heavier rails and to rebuild all their bridges, as this would entail the outlay of enormous capital. Of the ordinarily constructed locomotive, its two most vital parts are the valve-gear and the boiler. These are unable to meet the demands made on them, and experiments are being made in nearly every large shop in this country. The end looked to is a more speedy engine, which must necessarily be more weighty, and must be strengthened more at weak points. The locomotive now in use is the same one of 25 years ago. Speed and power, what the ingenious machinists are working for, can only be attained by lessening the machinery—making the construction of the engine more simple than it is at present. Mr. Strong, of New York, has, I hear, made several improvements, but I cannot say what they are at present."

"What is called the American locomotive, for design and beauty of model surpasses anything in the world. It is also much lighter than those used anywhere else."

"The English engine is more ungainly in appearance than the American, but when they are put on parallel tracks, they are neck and neck for speed, though the English has the advantage in point of strength."

"Building engines in America is more difficult than in England. Here allowances must be made for heavy grades; English companies have, by the expenditure of much capital, dispensed with grades. There are many points about the American engine that require perfecting before it can be recognized as the most complete locomotive in the world. Inventors in this line have received little encouragement from railway managers, and they have had little inclination to waste their time in unprofitable researches. Now the railways all over the country are looking for improvements, and the brains of the inventors are busy."

A CURIOUS STEAMER.—Matthew Turner has built a unique tugboat in this city for service in White's river. She is about 60 feet long and 15 feet beam. Her deck is of the kind most appropriately designated by the name "turtle back," being high amidships and sloping down toward stem and stern. The motor is a steam engine of great power, working two huge screws, one in the bow and the other in the stern. Everything about the little craft is exceedingly massive, and needs to be, as she is intended to withstand the terrible sea on the harbor.

The Board of Supervisors of San Jose have granted to S. A. Bishop, W. S. McMurry and Jacob Rich a franchise for building an electric motor or cable railway from San Jose to Santa Clara. The road is to be in operation within a year.

USEFUL INFORMATION.

Hardened Petroleum as a Fuel.

How it is Made and How Burned.

Efforts and experiments are constantly being made to utilize petroleum as a fuel. The Russians burn the waste after refining. Experiments in this country have generally been made with the natural product, just as it comes from the wells, in which condition it varies greatly in character and quality, and of course may require different conditions for being utilized as fuel.

But the most recent proposition is to reduce the natural oil to a solid substance and burn it after the manner of burning coal. This discovery comes to us from Russia. Dr. Ksuffman, in his report to the Russian Government upon the matter, describes the manner in which it is converted into a solid and burned, as follows:

"Petroleum, which is a hydrocarbon of the so-called methane group, may be saponified just like the oils, fats, fatty acids and wax, thus oxidizing the oil and combining it with soda or potassa salts. For this purpose the oil is heated and from one to three per cent of its weight in common soap is added, with which it is boiled for about half an hour. After that time it will be noticed that the soap is all dissolved in the oil, and the fluid will suddenly turn into a hardened, putty-like substance, which will get as hard as stiff tallow when cold. This may be pressed into any shape desired. The substance is very hard to light and burns quite slowly, without making any smoke, with a reddish flame producing great heat and leaving about two per cent odorless, black and hard residuum. Compared with coal, it burns about three times slower, producing, if the draught be well regulated, about seven times more heat than anthracite coal. It could well be used in a stove specially constructed for the purpose, or in the old stoves if they are changed, which will not be very difficult. It is, therefore, very probable that petroleum will take the place of coal in many instances in the near future, which fact stove manufacturers will have to take into consideration."

Should these results be realized, solidified petroleum as a fuel may lay claim to the following decided advantages:

1. It is universal, abundant and cheap.
2. It may be pressed into any form desirable.
3. It burns slowly, without smoke, and produces great heat.
4. The fluid petroleum can be piped to the point where it is desired to solidify it at a less cost than coal can be carried on cars.

When the great Pennsylvania Railroad Company becomes interested in the subject, it is natural to look for early and tangible results.

METHOD IN FIRING FOR STATIONARY ENGINES.—A correspondent of *Power* says: It may be of interest to your readers to have the methods which an old engineer employs in handling his fire. My method is to run as heavy a fire as my firebox will allow to be kept under the bridge wall, and not to disturb it more than once in a ten-hour run, then clean out with care and as speedily as possible, dress light and let it come up and get ready to bank. In banking, make sure to have an even fire, as deep as the bridge wall will allow. Then I shut my dampers and let it lie. In the morning I open and govern by the dampers. I do not touch my fire until 3:30 or 4 o'clock in the afternoon, and then proceed to clean as before. In order to do the work in this way it is necessary to have boiler enough to do the work easily and not have to drive the fire, and, another thing, it is necessary also to have the boiler set right to begin with. The one I have is 32 inches from the grate-bar to the under side of the shell, and is running 20-horse power by measurement. I am burning 800 pounds of screenings per day, or four pounds per horsepower per hour. If this is not a good showing, I would like some of your readers to get up a better one.

INGENIOUS DEVICES.—The *Cabinet-Maker*, in a recent issue, says: Not long since we noticed a very pretty effect caused by using large, nickel-plated round-head screws in putting together the casework of a set, and also by displaying them at other places where they could be made to appear to advantage. Rosettes were put on and held by a single screw. Moldings were fastened by these screws, and they appeared on drawer fronts and doors. They are very odd, and if the thing is not overdone will prove a ten-strike for a big run. Some one else is getting up something very unique. He has had some cast-iron screws made with rustic heads. They are in the shape of little knots, hurls and other marks usually found on branches of trees. One in particular, representing a branch cut off close to the main limb, is very effective. With these screws, our man will take a little table or chair and make a rustic concern of it in ten minutes. The device is not patented, and the man who gets the idea worked down into practice by the wholesale stands a chance of making a good thing.

BOILER INCORUSTATION.—An association of the several boiler inspection societies of Germany has had chemical analyses made of all the secret compositions offered for sale as specifics against boiler incrustation. The number reported so far is 32, and the association recommends that

nons of them can be used. Analyses of several compositions are given, which prove that some are actually harmful to the boiler plates. The profits on the most of them are enormous. One costing 4½ cents sells for 17½ cents; another costs one cent and sells for 6½ cents. In this country, however, there is no doubt but that there are some valuable preparations sold for that purpose, notably a preparation from encalyptos leaves.

THE WASTE OF WOOD.—It has been estimated by competent persons that, comparing the dead weight of a tree as it stands in the forest with the dead weight of the lumber that is obtained therefrom, not more than 25 per cent is actually delivered in the timber market. The remainder consists of limbs and slabs, roots and edgings, and hottings and waste in general, in the forest and at the sawmill. However extravagant and wasteful the timber trade may have been in time past, it may now be noted with satisfaction that, owing to the increased demand in various directions for these so-called waste products, it is likely that the proportion utilized will be reversed, and the loss not exceed 25 per cent, even if it reaches that amount. This is especially due to the growing uses for wood pulp, which now enters not only into the manufacture of paper—in itself a vast industry—but also finds employment in many other directions of almost equal magnitude.

FURNITURE needs cleaning as much as other woodwork. It may be washed with warm soapsuds quickly, wiped dry and then rubbed with an oily cloth. To polish it, rub with rottenstone and sweet oil. Clean off the oil and polish it with chamois skin.

GOOD HEALTH.

The Cancer Discussion.

John Stuart Mill says all reforms have to pass through the three stages of ridicule, argument and adoption. Our readers well know that the history of progress is the history of thought as occurring first in one or a few individuals. We should accordingly be very careful in dismissing as unprobable any departure from preconceived ideas and practices. This practitioner found long since that lard and vaseline as a basis for her salve was useless, hence used cream and now Lanoline. She discovered that no applications were of benefit without the giving of an internal remedy composed of the roots of that herb which composes her salve. Frequent and long-continued massage, when practicable, using the salve each time, is also a necessary part of the "new departure treatment;" also the combination with all these of a gentle galvanic current.

Plasters, as a rule, are objectionable; still, in some cases, their use is indicated. This lady has arrived at her knowledge by induction, based on 18 years' persistent work. We are led to make this allusion to her mode of treatment inasmuch as some inquiries have been made as to "where the remedy can be obtained." There is no "nostrum" to tickle the public pocket; on the contrary, this practitioner says that in the hands of those who could bring more educational facilities and greater experience to bear in the application of her remedies than can possibly be expected from her, there would be an increase in the amount of good thereby effected. She has been industrious, energetic and enthusiastic in her efforts to discover and develop a remedy for cancer. Wanting these qualities, no individual can, in any branch of knowledge, attain but the merest mediocrity.

Many patients live to testify of her skillful treatment. Many when nearing their end have implored her to "do something," as morphia contributed but little to their relief. Could any practitioner turn away from such? Should the inevitable end so soon to overtake these afflicted ones be counted as the ground for rejecting all evidence? This question must be answered at no distant date. The public and those practitioners who may be interested are entitled to hear the evidence; we ask them to search out practitioner and patients for themselves, and have all the information obtainable therefrom.

Epithets and abuse are no argument; nevertheless this is what has marked the language of those who oppose this practitioner's method, and we painfully regret to say, it has been extended to those who have taken an interest in bringing the matter before the public.

As was stated in the beginning of these papers, and as stated now, our object is to ascertain if this remedy has sufficient merits to warrant those who are so disposed in purchasing it for the benefit of the public.

H. F. Winslow, 876 Wood street, Oakland. Age 54. "In April, 1886, I noticed a little lump in corner of right eye; it became irritable, and grew rapidly till the eye was closed. On September 1, 1886, I saw Dr. Wheeler, Oakland. He said it was cancer. On September 2d, I saw Dr. Lane, S. F. He said it was cancer and proposed to cut it out at once, including part of nose, upper and lower lids, the eye, and part of the bony structure about orbit and nose. I then went to —, who said she could cure me without using a knife, and she gave me medicine, applying a salve to try and produce absorption, but failed, so tried a

plaster, and drew out the entire diseased mass in 13 days." *Notes.*—A soft cicatrix, circling around eye; looks perfectly well, and claims to be well.

Mrs. L. W. Pollard, Santa Clara. Age 39; no family. Grandfather and grandmother on mother's side both died of cancer. Her father, George Daggett, had cancer of lower lip, extracted by —, Sept. 2, 1881. No return. Mrs. Pollard "noticed a lump, walnut size, in her right breast; had spells of darting in it, breast slightly swollen, could move the tumor no more than a rock. Kernels appeared under her arms, nipple became slightly retracted. Saw Dr. Toland and Dr. Lane. They said it was cancer and proposed to operate. Left breast then became affected, and was 'working' all that time. Visited —, March, 1879, but could not remain in town and returned to the San Joaquin valley, where I resided at that time. Saw — for second time in Nov., 1879. Lump still increasing and becoming very painful. Took some medicine from — home with me and oams for regular treatment on January 23, 1880. It was then the size of a hen's egg, immovable, and most painful. Tumor in left breast painful, flatish, dollar-size, and growing upward. Left perfectly cured—there has been no return." *Notes.*—Patient looks well. Breasts healthy; skin never has been broken. Says "the lumps gradually disappeared." Seven months under treatment.

Mrs. James A. Linscott, Watsonville. Age 35; 1 child; mother's aunt died of cancer. "First noticed one year ago small pimple on lower jaw, right side, shooting pains in it; glands enlarged in neck; size of 10-cent piece; at end of three months discharging and spreading gradually. Saw Dr. Fagan, Santa Cruz; proposed to cut it out, as all his endeavors to heal it were unavailing. Saw Dr. Rogers, who also proposed an operation. Dr. Breyfogle also failed to heal it by applications. Visited — June, 1886. First week applied her salve; following week applied her plaster and it dropped clean out, leaving a hole." Scar long and soft. Looks well and claims to be well.

Regular Exercise.

Second only to the nourishment of the blood by food is the regulation of that action of all the vital organs by exercise. That exercise which is undertaken spasmodically and at uncertain intervals is injurious rather than beneficial. Judicious exercise for brain-workers is that which causes the blood to flow freely, and affords a change of position and action to the cramped and wearied muscles, in addition to some slight interest calculated to insure a change of thought and consequent relaxation to a tired brain. It should be taken out of doors and in the sunshine if possible, because sunlight is an important source of physical vigor.

Failing of open-air exercise, absolute purity of the surrounding atmosphere is imperative, because its respiration furnishes to the blood that quantity of oxygen necessary to the process of destructive assimilation, which restores vitality and tones the nervous system. The condition of the nervous system affects the secretion of the gastric juice, and, of course, its deficiency occasions impaired digestion. When one has been writing several hours in a badly ventilated room, or in one lighted with gas, exercise in pure air is required to supply the blood with oxygen, and thus prepare the way for the proper nutrition of the brain, nerves and muscles from the next supply of food.

With the brain-worker, whether he be literary man, lawyer, speaker or merchant, exercise replaces that degree of manual labor upon which the health of the average workman depends; but he should never be led astray by the idea that violent physical effort can, in any way, counteract the weariness arising from excessive mental toil. Exercise to the point of fatigue is suicidal to brain-workers, it is simply the killing of a half-dead man. The best time for gentle outdoor exercise seems to be about mid-afternoon, if it can be taken without exposure to excessive heat; the sunlight has chemical properties which act tonically upon the system. Early morning exercise has been favored, but it is as much to be reprobated as early mental or physical labor, because at that time vitality is at its lowest ebb, and it needs stimulation rather than further depletion; certainly, none but the gentlest exercise should be taken until the exhausted system has been supplied with abundant nourishment.

Not only should we exercise properly, but we should live temperately; we must not make exercise subservient to grossness of living, for we will suffer as did the ancient Greeks and Romans from premature exhaustion of the various forces of the body. Exercise is, in short, the helping hand, stretched forth to assist and enliven the various daily functions of the human framework, whereas the other condition is dragging it through the mire. With the ancients, as it should be with ourselves, age was obviously held to be a relative affair. In those days men of mature years exercised daily, in order to ward off old age. With them, also, the exercise of the muscles, and consequently the whole body, was simply a part of their education. At that period the whole art of education was embodied in *mens sana in corpore sano*. This soundness proceeded from the mutual balancing of the two forces, the physical and mental, which could alone result from the perfect harmony in the working of the several parts of the human frame.—*Manufacturer's Gazette*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH.—Cor. Amador Dispatch, April 9: All our mines are driving ahead as if they had only one more day to work. The Con. Plymouth's yield grows no less, and the energy with which her genial superintendent seems to be driving things, and the many improvements he is making, together with the promptness with which each month is met with their paydays, leaves no doubt as to the enormous product of this wonderful mine, which in a few days will have 160 stamps thundering away upon the ores sent to the top. The New Chicago and New London are running at full blast, and we think in the near future that there will be two more mills erected, if we can judge from the character and amount of ore raised from their respective sinking. The New London has her shaft down now over 900 feet, but do not propose to stop their sinking until they have reached 1000 feet; then levels will be run and another big mill added to the list on the great mother lode. Mr. A. J. Gregg, of Oakland, who owns 3500 feet on the mother lode adjoining the Alpine on the north, has subdivided the property into three parts and put them on the market at an aggregate price of \$10,000.

KENNEDY.—Amador Ledger, April 9: Everything pertaining to this mine is being conducted on a scale that indicates permanence. L. Newman & Co. have been awarded the contract of supplying timbers. Sam Williams has taken a sub-contract for hauling the timbers from the vicinity of the old Brandon mill. He bought four fine mules this week from F. Statts for \$580, and will put a six-mule team to work as soon as the roads will permit. There are 1200 logs now ready to be hauled, and it is thought the company will require from 3000 to 4000 timbers the coming season.

MISCELLANEOUS.—Some quartz taken from the shaft of the Middle Bar gold mine may be seen at Ginocchio's store. The ore is of a hard, flinty character. It carries considerable sulphurets of a bright yellow color. No free gold is visible to the naked eye. How such rock would yield by mill process, it is impossible to say. It is dissimilar in many respects from the general character of ore met with along the mineral belt. It is neither ribbon rock nor of the greenstone formation. We were shown the other day samples of quartz from the Amador gold mine near the Moore. The specimens were taken from the bottom of the shaft, which is now down about 150 feet. The quartz is very similar in general appearance to that met with in the Zeile and the Moore. It is plentifully charged with sulphurets. Sinking is progressing at the rate of about one foot per day. The rock is exceedingly hard, but the present contractors are making better progress than under the preceding contract. The Cosmopolitan mine on Dry creek, beyond the Gover and Seaton, shows a vein on the surface 40 feet wide, which prospects well in free gold. A tunnel is being run to cut the ledge further in the hill. It is intended for a permanent drain tunnel, and also to aid in determining the most desirable place for the shaft and hoisting works. A blacksmith shop has been constructed, and timbers are being hauled for use in the tunnel. Henry Sherwood, a mining expert, visited the Doyle mine in Hunt's gulch last Monday, for the purpose of reporting upon the same to English capitalists, who are desirous of investing in promising mining properties in this county. They represent almost unlimited capital. Work has been resumed on the Original Amador mine at Amador City. A building is being erected over the shaft. The machinery for the new mill at Quartz mountain, on what is called the Goodman mine, has arrived at Ione and is being hauled to the ground. Jake Griesbach is negotiating for the sale of his mine in Pioneer district to parties from San Francisco, for the sum of \$6000.

Calaveras.

WEST POINT.—Calaveras Chronicle, April 9: Mining is progressing finely, and the general outlook promises a prosperous spring and summer. The leading mines continue to yield the usual amount of dividends. The Keltz mine continues to turn out good ore and ships a portion of it to Selby's. Fifteen men are employed at this mine. The Lockwood mine development and production of ore continues with unrelenting activity. Two sets of hoisting works are kept continually in motion. The south level in the north shaft is yet being driven in good ore, being 100 feet in length; size of ledge in level is from one to five feet in width; average value, \$300 per ton. Forty men are employed at the mine and reduction works. The Scorpion mine is looking very well in bottom level. The body of ore, as far as explored, is nearly 100 feet long; average size of ledge is one foot of a heavy sulphureted ore. The management of this mine is exemplary and ought to be followed by others in this district. They hire only faithful, experienced and skillful miners, and a great deal of the work is done by contract, and this is the big item of the success of a mine. The Scorpion company has dispensed with its Tustin pulverizer and has just completed a 5-stamp mill, which will start crushing by next Monday. Twenty men will be employed in this mine shortly. The Chino mine is being worked by Mr. Novell. Levels are being run, and we hope soon to have the pleasure of chronicling a big strike. Perkins Bros. & Rowe are about to sell (or at least rumor says that they will receive \$100,000 for their group of mines) to an English syndicate. This includes the Billy Williams, Barnes, and the old John Henry. These are good mines and will pay by first-class management.

AROUND ANGELS.—County Record, April 5: The mining interests in and around Angels are looking up. A cleanup was made at the Lane mine last Saturday, and with what result, we were unable to learn; but our informant tells us it was not on the decrease, but to the contrary, thinks it is improving. Just prior to the cleanup we visited the mill, and found the plates looking extremely well. The plates have an inclination of $1\frac{1}{4}$ inches to the foot, are 52 inches wide, and 10 feet in length to each battery. The Angels gold mine, commonly called the Tozier, has been in active operation for the past five or six weeks, and we understand is proving satisfactory. The mill has been shut down for a short time, for

the purpose of making some improvements. It is the intention of the superintendent, Mr. G. Fox, to displace the J. B. Low mills, two in number, which have been in operation at this mill for some time past, and which have a capacity of 20 tons each, in 24 hours, for an improved mill with more crushing capacity. In addition the mill also has four Frue vanners. The Osborn mill at Smith's Flat is turning out the filthy lucre at a rate satisfactory to the owner, Mr. G. Osborn. The Waterman mine is running steadily day and night. A cleanup was made recently which yielded handsomely. An examination of the plates showed amalgam in no small quantity, which clearly demonstrates that the gold is in the ore.

ANOTHER RICH STRIKE.—Prospect, April 9: The Esmeralda mine on Indian creek, so favorably known for the remarkably rich paychutes heretofore discovered in it, has just outdone all previous performances. A few days ago another strike was made, this time in the west drift. The rock is of a bluish white color, of an extremely fine character, and of the very richest kind, the vein being four feet wide. There is every indication that the Esmeralda will prove to be one of the rich mines of the State. The engine and boiler at the Plug Ugly gravel claim has been removed to the Woods quartz claim on Indian creek, near Sheep Ranch. Mr. Woods was in town the latter part of last week, having the machinery taken down and hauled off.

El Dorado.

KELSEY.—Mountain Democrat, April 9: The Gopher-Bolder mine of this place, of which so much has been written, is gradually developing into one of the finest mines in the county. The owners of the property are energetic, live business men, and contemplate pushing the mine to its fullest capacity. At the present time there are several tons of very good ore on the dump, which have been taken from drifts and the main shaft. The company is making preparations for the erection of hoisting-works. As yet the owners have not developed this property to any great extent, but enough has been done to ascertain that it will undoubtedly make them prosperous and happy men yet. Take it all in all, our quiet burg bids fair to become one of the most promising mining districts on the divide, and that, too, at no distant day. The quartz ledge, known as the Kelley mine, is now leased to an English company. The mine will no doubt prove a bonanza if the rock continues as rich when they sink as it is a short distance below the surface. They intend putting men at work taking out ore, and will erect a mill the present season. Warf and Page are still working in the vicinity of the Galt mine. They report finding fine prospects of gold in paying quantities.

CENTENNIAL.—Georgetown Gazette, April 9: Work on the Centennial mine, near Butcher ranch, is being pushed ahead as fast as possible. A contract has been let to build a road, and we hear that H. S. Morey, of Placerville, is to furnish a ten-stamp mill for the mine.

Inyo.

VALUABLE ORE.—Register, April 9: Broder & Co., of Deep Spring, shipped two tons of ore last week, valued at \$1500 per ton. It was taken from the Cliff mine at that place.

Nevada.

A VERY RICH FIND.—North San Juan Times, April 9: Rumor has it that Messrs. Humphrey Calanan and Robert Holland, both of Cherokee, discovered a quartz vein, or lode, the other day, not far from the town of Cherokee, and four miles from this place, which is two feet wide (the ledge, not the town) and is rich in free gold. The whole country above here is excited over the matter, and lots of men are and have been for a week or so past out prospecting. The young men who found the rich vein keep their own counsel and will not disclose the location of their find until they have complied with every requisite of the laws governing the location of quartz claims.

Placer.

MAYFLOWER.—Placer Republican, April 9: Work was suspended in the shaft of the Mayflower tunnel a week ago Sunday, on account of the water, and the men are now working only on the face in the tunnel which is in 2200 feet. About 300 feet have been made on the two faces at the bottom of the shaft, so that one-half of the whole tunnel has been accomplished. Superintendent Chapellet says that contractor Boyle wants to throw up his contract, and that if he does the company will itself finish the tunnel. It will require about a week to pump out the shaft, and it is thought that the whole tunnel will be completed in less than five months.

San Bernardino.

WEST CALICO.—Calico Print, April 9: Recently Robert Anderson sold his interest in the Little Waterman to Dan Taft and C. R. Knapp. This mine is situated in West Calico near the Sue, and is a fine prospect, having yielded its original owners \$8000 or \$10,000. There is still considerable ore in sight, and it is the intention of the present owners to develop the property into a first-class mine. T. H. Eckles is working on the Inevitable, and his partner, E. Woolman, on the Little V. adjoining, and both mines are showing up well and have been for months, occasionally rich pockets being discovered from which they realize liberal dividends. These mines are as good as banks, with no signs of "suspension of payments." During the forepart of the past week surveyors were engaged in determining the boundaries of the Harmonial No. 1 and Zephyr mines preparatory to applications for patents.

Shasta.

IRON MOUNTAIN.—Courier, April 9: The owners of the Lost Confidence mine, Iron Mountain, have out over 300,000 (?) tons of milling ore, enough to keep the works going for over a year. The roaster and mill is kept going day and night, and is not allowed to get cool. The successful working of this ore on the ground teaches the lesson that hundreds of mines containing similar ore can be profitably worked under the right process, and we understand that the process is very simple and not unduly expensive.

PUMP.—Shasta County Democrat, April 6: A large Cornish pump is being put in at the Gem mine at Lower Springs. Development work on the Little Maud mine on Iron Mountain is proving that mine to be valuable. The Day mine, Old Diggings, is under attachments and in the hands of a receiver. Sam Jones "struck it rich" on the west side of

Muletown mountain last week. He discovered a well-defined vein, though small, that yields ore enormously rich in free gold. He has been mortgaging ore that pays \$1 a pound. Last week Ollie Whittion and Mont Love discovered a four-foot ledge near Shumaker Springs, in Big Backbone, samples from which assay \$25 to the ton in gold and silver. John P. Jones, the senator, owns one of the best mines near Muletown, on Clear creek, there is in this part of the State. It is patented, and he has owned it for the last 20 years, and will neither sell, lease nor work it. There is a shaft on it 150 feet deep. The last ore worked nearly 20 years ago yielded about \$60 to the ton. He has kept a man on the ground all the time, and recently ordered that the old tunnel be cleaned out. The fact that he has had the tunnel cleaned out indicates that the senator intends to reopen the mine shortly. The arastra at the Calumet mill, below battery, silver plates and concentrators, saved on its last run 16 per cent of the gold product. At no time has it run below 12 per cent. This arastra is one of Paul's inventions.

Sierra.

DEVELOPMENT.—Mountain Messenger, April 9: The prospect for considerable further development of the ridge at the head of Goodyear creek, the coming summer, bids fair at the present time, as Eastern parties are becoming interested who are willing to put up money to run back the main tunnel. The main tunnel is in 1650 feet on the Gold Bluff quartz ledge, and a side tunnel being run northwest toward the main ledge, by survey 34 feet ahead.

Tehama.

RICH PLACERS.—Red Bluff People's Cause, April 9: Quite extensive mining development in placer mining is going on on Clover creek, east of Millville. The Millville Mining Company has completed its ditch, and this week its pipe will arrive from San Francisco, which will be laid as soon as possible. Then piping will commence. Young Martin, of Millville, and others have located 160 acres lower down on the creek, which prospects remarkably well. The gold is generally heavy. One nugget, weighing 50, was picked up, and smaller chunks are frequently found. Young Martin thinks he can pick and shovel into a sluice-box on his ground \$6 a day to the man; good ground that. We are informed that about four miles of ground on Clover creek prospects first-rate, all of which can be covered with water.

Trinity.

RAY FORK.—Trinity Journal, April 9: The quartz-mill is not running, as the roads are too bad to haul quartz from the mines. It is said that the men who undertook to find a ledge in the Farmer mine have succeeded; also, that Frank Marsh and T. Greenleaf have discovered a ledge which prospects well in their mine up Kingsbury gulch. Seales & Rennie are still taking quartz from their mine, and the indications now are that they have a rich ledge.

Tuolumne.

TO BE DEVELOPED.—Tuolumne Independent, April 9: Dave Levy has succeeded in reorganizing a strong company to develop the "Old Tuolumne" mines, above Columbia. Mr. Randolph C. Davis, a practical and experienced miner, will take charge of the property, and under his able management we may expect large results. Several valuable ore bodies are already uncovered, and hoisting works, pumps, etc., are already on the ground. These mines, from work already done, are known to be valuable. A sufficient working capital has been subscribed to keep the work of development progressing right along.

Ventura.

PIRU DISTRICT.—Santa Barbara Press, April 5: The ore of the Piru district is free milling, gold predominating in the assays over silver or the baser metals. The Esperanza shaft is down 80 feet, and the ore brought to the surface runs about \$8 for mining and milling. Eight ore veins run through this company's property. Hoisting machinery for the Esperanza has already been purchased, and as soon as Mr. Harper returns from San Francisco, a ten-stamp mill will be erected by the company. Mr. Harper will serve in the capacity of superintendent at the mines, and he states that the property will be actively worked for all there is in it.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, April 9: On the 1300 level, the north drift from west crosscut No. 1 was advanced 40 feet; total length, 129 feet. South drift No. 2, from east crosscut No. 1, was advanced 30 feet; total length, 124 feet. This drift is still showing ore which gives fair assays, and it will soon connect with the upraise above the 1400 level. On the 1400 level, raise No. 2 was carried up 15 feet; total length, 87 feet. It still continues to show ore of average quality. Raise No. 3, above the main north drift, has connected with the old stopes. On the 1435 level still continue stopping out the usual amount of ore from the bottom of winze No. 2, 105 feet south from the south line of the Ophir mine. On the 1500 level the south drift was extended 40 feet; total length, 685 feet. During the week 38 bars of bullion, valued at \$140,000, were shipped to San Francisco. The pulp assays average about the same as last week, and the shipments to the Morgan and Eureka mills were about the same.

BALTIMORE.—Are cleaning out the main drift on the 300 level. This drift was run to the ledge some years ago, but no prospecting from it was then done. A raise will now be made in the vein up to the 225 level. On the 400 level are cleaning out the south-west drift preparatory to extensive prospecting. On the 500 level, where the vein was cut out about two weeks ago, and good ore found, no work has been done for several days. There was so much water and slum in the drift that not over an inch a day could be made in the work of cleaning it out, as it was constantly flowing forward. This being the case, the drift was left to drain out.

CHOLLAR.—The hoisting apparatus at the Sharon shaft on the croppings is working well and smoothly. Ore is now being regularly hoisted from the 350 level. Good progress is being made in cutting out the station at the 400 level of the old Chollar shaft. From this a drift will be run to strike the Sharon shaft at a depth of 400 feet. Drifts will also be run in other directions from this point. The drift on the 1300 level that is being run by the Nor-

cross folks yesterday had but 50 feet to go to connect with the old Chollar incline.

OCCIDENTAL.—In the upper tunnel the south drift from the north incline winze was extended 10 feet; total length, 188 feet. West crosscut No. 2 was advanced 8 feet; total length, 46 feet. West crosscut No. 3 was extended 10 feet; total length, 35 feet. Extracted to tons of milling ore from the above-mentioned openings. From the station on the 100 level of the north incline winze the south drift was extended 15 feet; total length, 59 feet. The north drift was extended 12 feet; total length, 46 feet. Each of these drifts shows narrow stringers of ore.

GOULD AND CURRY.—On the 425 level the south-west drift from the main south drift was advanced 40 feet; total length, 144 feet. The face is in porphyry. On the sixth floor the upraise, 42 feet above the track floor, is in quartz, some of which shows milling value. On the 300 level the south drift from the east crosscut was extended 15 feet; total length, 48 feet. It is in clay and quartz showing value. A north drift from the west crosscut was advanced 25 feet; total length, 85 feet, and is in porphyry and quartz.

SAVAGE.—The upraise above the 600 level continues in good ore. It is up 20 feet, at which point good ore is being stoped out. On the 800 level the south drift from crosscut No. 3 has been advanced 18 feet, all the way in quartz. An east crosscut from this drift has been extended 20 feet in quartz which gives good assays. No. 1 east crosscut has been started from the main lateral drift on this level. It is now out about 15 feet.

HALE AND NORCROSS.—On the 1300 level the main south drift has been advanced and timbered 50 feet. The face is now about 50 feet from the old Chollar incline, with which it will connect in about a week. On the 1200 level the north drift has been timbered for a distance of 40 feet. On the fifth station level, the south drift has been extended and timbered for a distance of 25 feet.

HAYWOOD.—About 30 miners are employed and sufficient ore is extracted to keep the Thompson and Briggs mills in operation. A prospecting drift is being run toward the hanging-wall on the 200 level. It has already shown up a large body of fine ore. The management expect to put on a third mill in a short time—as soon as it can be obtained.

BEST AND BELCHER.—On the 800 level west crosscut No. 4 was extended 22 feet; total length, 234 feet. The face is in porphyry. On the 1300 level east crosscut No. 1 was advanced 75 feet; total length, 341 feet. East crosscut No. 2 was advanced 65 feet; total length, 278 feet. Both are in vein porphyry.

YELLOW JACKET.—Are extracting and sending to the mills 160 tons of ore a day. This ore is coming from the 1300 and 1400 levels. Prospecting is in progress at several points between the 1300 level and the roots of the sagebrush. At one or two points some good milling ore has been found, but no very extensive deposits as yet.

BELCHER.—Are extracting and shipping 100 tons of ore a day. This goes to the Santiago mill. The Vivian mill, which has been crushing Overman ore, will soon be put to work on ore from the Belcher. A full force of miners has not yet been put to work in the ore-producing sections.

OVERMAN.—The usual quantity of ore is being taken out on the level of the Petaluma-street tunnel. This has been crushed at the Vivian mill, but as the Belcher folks now want that mill, it will be necessary to make new arrangements for the reduction of the ore of the mine.

ALTA.—The rock in the face of the drift on the 825 level still continues hard. It has about 160 feet to go to connect with the winze down from the 725 level. The Keystone raise from the 725 level is up 140 feet. It is still following the banging-wall.

MEXICAN AND UNION CONSOLIDATED.—On the 1300 level the joint Union and Mexican drift, running northeasterly, was extended 22 feet. This drift is now 426 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 15 feet; total length, 319 feet.

IOWA.—Work is going on at the usual points. Superintendent Curtis is now below in search of suitable machinery for crushing the gold quartz that has been found in considerable quantities in several of the openings made.

UTAH.—On the 472 level the north drift from the main west drift was extended 45 feet; total length 458 feet. The face is still passing through vein porphyry and quartz, the latter showing value by assay.

CROWN POINT.—As yet a full force of miners has not been put to work, but they are now extracting 130 tons of ore a day, which is being worked at the Mexican mill, on the Carson river.

OPHIR.—On the 1065 level west crosscut No. 1, from the south drift, was extended 42 feet; total length, 195 feet. East crosscut No. 1 was advanced 30 feet; total length, 362 feet.

SCORPION.—The east drift on the 300 level has been advanced 30 feet; total distance east of the shaft, 270 feet. There has been no change of material during the past week.

BULLION.—Are making fair headway in the east drift on the 200 level. It is still in porphyry. The work of cutting out the station on the 300 level is progressing favorably.

JUSTICE.—Work in the drifts on the 250 and 300 levels is progressing as usual. Some good milling ore is being taken out in making explorations on the two levels.

ANDES.—A considerable amount of prospecting is being done on the 200 and 300 levels, and the usual amount of ore is being saved for milling.

OEST.—A new horse-whim has just been set up, and much excellent ore is now being raised. Some of the quartz shows well in free gold.

ALPHA AND EXCHEQUER.—Good headway is making in sinking the shaft below the 120 level.

ATLANTA.—The new tunnel is being pushed ahead with two shifts of miners.

VIVIAN.—The usual amount of good milling ore continues to be extracted.

Aurora District.

THE CAMP.—Walker Lake Bulletin, April 6: Springtime has struck Aurora, everything looks pleasant and everybody feels hopeful. As yet, business

is very quiet, but the prospects are bright. The arrival of Mr. Ann will be the precursor of a renewal of work on the company's mines and other mining property now in litigation will soon be relieved from the embarrassments of legal proceedings. In the meantime, the Silver Lining is still working the usual number of men, and good progress is being made. The upraise is being pushed as fast as possible and connection will soon be made. The ore is looking well and bullion will be produced in a short time.

Central District.

GOOD ORE.—*Silver State*, April 9: S. W. Ruse went down to Central district a few days ago, where his father is at work on the Emma Nevada mine. He brought up a sample of the ore and it assayed \$644.10 in silver to the ton. It there is much of that kind of ore in the mine it will pay, if silver is down to 93 cents an ounce.

Columbus District.

AN IMPORTANT DEVELOPMENT.—Walker Lake *Bulletin*, April 6: On Sunday night the two ledges of the Georgene mine were struck in the lower shaft level, and ore was hoisted from the shaft on Monday. This is a most important development, and will probably make the Georgene the leading mine of the county. The indications are that the force will be doubled in a short time, and generally the outlook of Candelaria has become very promising.

THE MOUNT DIABLO.—The Mount Diablo force is being increased daily and ore is being piled up in heaps at the mill. Large quantities of ore are stored in the tunnels ready for hoisting and the reserve in sight was never so large as at present.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, April 10: During the past week ore shipments were made from the mines of the district to the Richmond works—Avon mine, 12 tons; Massachusetts, 1 ton; Silver Connor, 11 tons; Robinson, 5 tons; Hoosac, 3 tons; Eureka tunnel, 15 tons; Dunderberg, 77 tons; White Pine, 2 tons; Roslin, 12 tons. To the Eureka Con.—Fraser & Molino mine, 1 1/2 tons; Lincoln, 1 1/2 tons; Harris, 2 1/2 tons; May, 1 1/2 tons; Silver Lick, 1 1/2 tons.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, April 8: Fair progress has been made with the work at all points. North gangway, 400-foot level, has been extended 20 feet.

BELLE ISLE.—East crosscut, 250-foot level, has been advanced 5 feet. Rock extremely hard. Line crosscut, 150-foot level, advanced 5 feet; total length, 121 feet. North drift from same extended 10 feet; total length, 82 feet.

NAVAJO.—During the past week have cut out and started a winze on the east vein 75 feet south of No. 3 crosscut, 150-foot level, to prospect the vein below that level. South crosscut from line crosscut, same level, advanced six feet; total length, 55 feet. East crosscut at south end extended 10 feet. South drift on west vein extended seven feet. No material change in any of the workings.

NEVADA QUEEN.—Operations were suddenly and entirely suspended on Wednesday morning by the total destruction of the works by an explosion of giant powder. Superintendent Coffin authorizes the statement that the works will be rebuilt just as soon as lumber can be procured. There is at the present time, however, none on hand in the yards in Truckee, but the mills at that place will start up next week, and it will take but a few days to fill the orders from here. The roads between this place and Elko are improving every day, and no fears need be entertained of any delay in freighting from the railroad.

Willow Creek District.

MINERS AT WORK.—*Cor. Silver State*, April 7: The Planet mine, owned by Choat Brothers, is a gold-bearing lead, and is situated on the north fork of Willow creek and on the east side of Gold hill, and on this mine there is a tunnel run into the hill on the ledge about 100 feet with good pay ore all the way. A winze was sunk on the lead 50 feet in depth, and had from two to three feet of good pay ore. This winze was sunk about 20 feet from the face of the tunnel, which will make the depth on the ledge 100 feet, and the ore they extracted from the tunnel and winze in drifting and sinking is 100 tons, which they intend to work immediately in two astras, which are run by water-power, with the capacity of about three tons in 24 hours. The Denmark mine, owned by Chris. Raabe, is on the same lead as the Planet. This mine is on the forks of Willow creek, and has a shaft sunk on the ledge 50 feet, with good ore from top to bottom. A lot of it has been shipped to the Reno reduction works, and will speak for itself. There are several tons on the dump which he intends to work in an astras and will start it up about the 1st of May, and all of this ore was extracted in sinking. The Golden Era mine is owned by H. H. McColley & Co. This mine is situated on Gold hill, and has a tunnel run on the lead 100 feet; the ledge being from two to six feet in width. There has been some very rich ore extracted from this mine. This ore lays on the dump, and free gold can be seen in it without the aid of a glass. H. H. McColley intends to resume work on it in a few weeks and make it a paying mine. The Mammoth mine is owned by Shrewsbury & Wilson. This mine is situated on the top of Gold hill, running north and south, and is about 1000 feet above the level of Willow creek. The lead is 25 feet in width. The formation is slate and quartzite. Twenty feet from the surface there is a crosscut run from the footwall to the hanging, which is 25 feet, and on the hanging-wall there was two feet of good ore. At this point a winze was sunk to the depth of 40 feet, with two feet of good ore all the way. There is several tons of choice ore on the dump, which they intend to work as soon as possible. The Jeff Davis mine, owned by J. B. Bowden & Co., is the south extension of the Mammoth, and has several tons of ore on the dump, and is about to be sold to a San Francisco Co. The Iowa, owned by Harris & Drummond, is a silver mine, and is situated about one mile from Willow creek. Several tons of ore extracted from this mine and worked in H. H. McColley's mill gave good results; it is a fine-milling ore. Mr. Harris has resumed work on it, and has about 100 tons of ore on the dump that will assay from \$50 to \$100 per ton, and from what can be seen it is a very promising mine. H. H. McColley has resumed work on his Flat creek mine. This mine is the extension of the Wild Deer, which looks very favorably.

ARIZONA.

BIG MILL.—*Prescott Courier*, April 9: The Vulture mill will shortly have 180 stamps. There are thousands of tons of gold rock in sight. A large mill will soon be erected near mines recently purchased from W. H. Robbins & Co., in Bradshaw district. All miners who have worked to the Peck and Occident are of the opinion there are great quantities of ore under the water. If so, Alexandra will shortly have a large population. The Peck, if memory serves us correctly, yielded nearly \$2,000,000 in a short time—that, too, with the poorest sort of management. Brooks & Ferguson have sent in a lot of rich ore to the sampler. Mr. Slack has leased the Happy Jack mine, Lynx creek, struck a fresh body of high-grade ore, and is delivering a lot of 20 tons at the sampler. Several small parcels of placer gold were received here yesterday. Another large shipment of silver was this week made from the Tip Top mill. Chlorides of Humboldt district shipped \$30,000 worth of ore last week. Mr. Jones, one of our energetic mining men, returned here yesterday from the East, where he purchased machinery which will be added to the Azlan mill, Groom creek. His intention is to start the mill some time this month and learn, by actual working test, the process that is best calculated to work ores of this section.

TOMBSTONE.—*Democrat*, April 4: Machinists are now engaged in examining the machinery of the Grand Central hoisting works, and it is very likely that this means a rebuilding of the property and a resumption of work on the hill. There is now more activity among the mine-owners than for a long time, and taking everything into consideration, the *Democrat* feels safe to predict and almost assert that before many moons the city of Tombstone will be in the midst of a permanent and substantial boom.

COLORADO.

RIO GRANDE COUNTY.—*Rio Grande Prospector*, April 7: Foreman Arthur Burton, and Assayer E. C. Koch, of the Anne Company, Summitville, brought in another gold brick last Sunday. This brick is valued at \$31,450, is 914.6 fine, weighs 1663 ounces, and is the product of 23 days' run of 40 stamps. Less than a month ago, the same company landed at Del Norte a brick worth, according to late New York assay, \$33,147.71. This brick was the product of 28 days' run of an average of 50 stamps. It weighed 1691 ounces, and was 948 fine. The Little Annie Company has just realized \$8600 from 29 tons of concentrates shipped to Denver recently. Here we have a product in gold of over \$73,000 from an average of less than 50 stamps in 51 days. The gold bricks have been landed at Del Norte and handled by many of our citizens, so there can be no mistake about it. The concentrates are included in this estimate, without which the output amounts to \$64,597.72.

IDAHO.

AROUND KETCHUM.—*Keystone*, April 7: The rapid disappearance of the snow from the mountains and the advent of the genial, warm days of spring are hailed with delight by the miners, as both combined give promise of an early reopening of roads and the speedy resumption of active operations. A long and tedious winter always has a depressing effect upon a mining camp, and to worry through it requires more than little patience. The first indications denoting the throwing off of the icy fetters and the advance of spring are anxiously watched for, and as the days gradually grow longer and longer, and the great banks of snow succumb to the warm rays of the sun, time passes much quicker, while the lethargy of winter is shaken off and preparations begun for the work of another season. Every indication points to a season of unusual activity about the mines during the coming months, and when once operations have commenced they will be continued on a far greater scale than heretofore, until the storms of another winter drive the wrestlers of earth's hidden treasures back once more into more reasonable and comfortable quarters. It is very probable that the mines on Warm Spring creek, Bassett gulch and Boyle mountain will cut an important figure in the output of ore next season. During the winter a great deal of work has been done, attended with more or less success, and a good showing is made as a result. The owners of a number of claims in these localities are highly pleased over the prospects and intend to prosecute the work on their mines more vigorously than ever at the earliest possible time after the roads are again in traveling condition. The reports from Smoky district are of the most encouraging character, and new strikes are reported every few days. It is anticipated that at least 400 men will be at work in the several mines and upon claims by next June, while some put the number at a still greater figure. It is gratifying to be able to record the growing interest taken in Smoky district mines, and the prediction made last year that the district would soon become the great mining camp of this part of the Territory will apparently be verified. Owing to the uncertainties of travel and the worse than no mail facilities at present, only meager reports are obtainable, but all coming in are of the same general tenor and of the most encouraging kind. In the King of the West, Carrie Leonard, Dollarhide, Silver Star, Tyrannis and several others, a great amount of work has been done during the winter and the mines show large bodies of ore. It will be a busy time when shipments can be resumed.

KEYSTONE.—*Challis Messenger*, April 5: Al. Gay was down from the Keystone mine and returned yesterday. He informs us that head partner, Chas. Cook, have taken out a few tons of good ore this winter, while sinking on the chute of ore, and that they have a very good body of ore developed. They have been running a tunnel for the past six weeks, which tapped the ledge below the shaft on Saturday last. They expect to take out a considerable quantity of good ore now in a short time, and to make a good thing before their lease expires.

ROCK CREEK MINES.—*Wood River Times*, April 6: E. M. Morrissey, of the French mine, which lies between the Guy and the Montezuma, on Rock creek, was in town yesterday, and informed a *Times* man that he and his partner, Ed. Mahan, have a good showing in their claim. They run their first tunnel 108 feet without finding the ledge; but the second tunnel (a lower one) struck the ledge when in 50 feet. They have 17 or 18 inches of chloride ore, the assay showing \$291 per ton, and he thinks

it will run not less than \$200 on an average. Mr. Morrissey says that Ole Rorem, lessee of the Guy, which has lain idle for some time, has reduced the water in the mine to the tunnel level, and will begin an exploration at once. The old workings will be used if possible; but if they are so badly caved that it cannot well be done, Mr. Rorem will sink 50 or 60 feet. He is satisfied that the Guy will soon resume its place among the producing mines of Wood River. D. J. Johnson and Al. Long, lessees of the Montezuma, have run a tunnel over 70 feet, and started an upraise. They have a fine showing of ore that runs \$150 to \$200 per ton, and will be ready to ship when the roads permit—which will probably be in two or three weeks.

NEW MEXICO.

SHIPPING ORE.—*Socorro Bulletin*, April 9: The Graphic, Kelly, Grayhound, Cavern, Juanita, Hard-scrabble, Tiptop and Fashion, in the Magdalena district, are all producing and shipping ore. Frank Wilson is working on a 12-foot face of 31 per cent copper ore in the Compromise mine, 40 miles east of this city. The ore in addition contains 38 ounces silver and some gold. Col. E. L. Mann and Mr. Griffith, of the Uncle George Mini & Company, are engaged in uncovering the vein on their extension of their Silver Glance claim, in the Linitar district, preparatory to sinking a deep shaft on the most propitious portion of the lode. It is a good idea, and an example which we would commend others to follow. Too many working shafts are made in a hap-hazard sort of way.

KINGSTON.—*Cor. Socorro Bulletin*, April 9: The camps never looked so well on the middle, south and north Perchas. New and rich strikes are being made every week in the lime belt, and the fissure veins on the north Percha are showing up better and better as development is being prosecuted. Three of the properties composing the Ingersoll group were sold last week for a large sum, not made public, the Ingersoll people, however, reserving the Ingersoll extension.

HERMOSA.—The Pelican-Eagle group is the scene of considerable activity. Twenty-three miners are working on leases and are taking out a considerable quantity of ore which they will soon ship to Socorro. Richard Mansfield White has a number of teams on the way to Engle loaded with ore destined for treatment in Socorro from his Polomas Chief. It is way up ore. The Aetolope shipped ore last week by bull team for Socorro.

GOLDEN.—While the excitement which attended the recent rich strike in the gold placer here has in a measure subsided, the placer miners are still busily at work and are making money. S. P. Conger has struck it very rich on the Canon del Agua grant. He affirms he has rediscovered the old Saint Lazarus mine, of early times, which was worked by Pueblo slaves under the supervision of their task-masters, the Spaniards, prior to 1680. The stamp-mills at San Pedro are running night and day, and the general manager, Mr. Chittenden, has a force of men boring a new artesian well to supply his 25-stamp-mill more fully with water.

MONTANA.

DUNKLEBERG CREEK MINES.—*Cor. New Northwest*, April 9: The Dunkleberg Creek mines, through the energy of your townsman, Dr. A. H. Mitchell, are enjoying a substantial boom. Your correspondent, with Prof. John F. Smith and Wm. Albright, went over the hills to what is now called Mitchellville last week. The first thing that attracts attention is the immense piles of ore sacked up near the company's assay office preparatory to shipment. They are down 80 feet on the Forest Rose, with an incline shaft, and have an incalculable amount of ore in sight that carries from 40 to 50 per cent lead, and from 33 to 55 and 100 ounces in silver. There are eight men employed in the mine. They expect to more than double the force the coming week. There are four men at work at the Bellair, which is also a producer. There are 34 men working in Mitchellville at present. This camp is situated similar to Boulder, only the canyon is not as wide. The trend of the lodes is north-east and south-west. The Forest Rose, Bellair, Little Joe, Stonewall Jackson, and the Contention are the principal producers so far. The last named mine was one of a group sold to Vice-president Oakes, Dr. Mitchell and others last summer by Frank Stalabass. On the 1st of January, Mr. Stalabass came back to his old field and performed a coup d'état—that is, he jumped or made a relocation of most of the leads he had sold. He has a force of five men at work on the Contention, with Helena parties backing him. The owners of the Bellair, Forest Rose and Little Joe lodes are Dr. Mitchell, Wm. Perriman and Frank Carnes. They have been bailing their ore to Drummond all winter, but the railroad company is going to put in a sidetrack for them immediately at a point near Benton Hoover's ranch, which will be their shipping point in the future. There are, altogether, over 100 locations in the Dunkleberg district. A peculiar feature of this district is the formation. On the southeast it is a granite and porphyry and conglomerate where the ore is not so base. Contiguous to this on the northwest side of the gulch it is lime with a quartzite contact. One feature, however, about this district that insures it a prominent place in the catalogue of producing districts, is that it is productive of very high-grade lead ore. Every smelter that has tested it is now bidding for it. There are parties there from Butte now negotiating a bond or lease on the Stonewall Jackson, which is owned by Frank & Dunkleberg. The machinery for the new mill at Black Pine is still at Drummond. They will either haul it up Willow creek right away, or through Henderson gulch, which is the most favorable route for a good country road. They have some 14 men at work in the mines, and while the mine continues disclosing extensive resources, Manager Pack realizes the importance of keeping up exploration work ahead of the extraction of mineral, and levels are being run on the plane of the ore body preparatory to the extraction of the ore disclosed. The lumber is on the ground for the new mill.

THE RENA MINE.—*Butte Inter-Mountain*, April 9: Yesterday Mr. A. C. Ritter, of Argentina, came up to Butte to remain a few days. Knowing that he was recently an owner of a promising mining property near Argentina, an *Inter-Mountain* re-

porter inquired of him for some particulars. The Rena mine is situated in the Montana mining district, about three miles north of Argentina. A perpendicular working shaft has been sunk on the property to a depth of 100 feet. There is also an incline shaft to the same level. A crosscut there shows a well-defined lead of about two feet in width, between well-marked walls of porphyry shale. Thirteen carloads of ore from this mine have already been shipped to Denver and Omaha, and the ore ran on an average \$90 to the ton, two-thirds of which was gold and one-third silver. The ore also goes about 15 per cent lead. The mine was discovered and owned by Witter, Miles & Lawrence, who sold it a short time ago to a St. Louis company for a consideration of \$30,000. The mine is considered very promising.

OREGON.

CLEANING UP.—*Jacksonville Times*, April 8: A few of the miners of Josephine county have commenced cleaning up. Haskins, Long & Co., of Star gulch, have finished cleaning up and made good wages while at work. The Sterling Co. is running two pipes day and night, and disposing of a large area of ground. Many of the mines are cleaning up, the continued warm weather having made the water light in many places. Simmons, Decker & Co. and Wimer & Sons, of Waldodistrict, still have plenty of water, and are making the most of it. Thos. H. Berryman, of Applegate, who has one of the best drifting claims in Southern Oregon, continues to do good work there. Smith & Lynch, of Wagner creek, will no doubt make a good season's run. They recently picked up a piece of gold worth \$128. J. Klippel, of Poorman's creek, has washed off a large piece of ground this season, and will not finish cleaning up before the middle of June. D. W. Marsh and J. Baker, two experienced California miners, are prospecting in the Applegate country. They speak favorably of this section. E. Roten has discovered a new ledge in Willow Springs precinct, which shows considerable free gold. There is said to be plenty of this ore in sight. Klippel & Baumele's mill, on Shively gulch, is not making a steady run as yet, owing to the scarcity of quartz on the dump. This deficiency will probably be supplied soon. Miller & Huggins, of Farmer's flat, are engaged in cleaning up, and will be done about the middle of the month. They have picked up several pieces, one of them weighing \$10. Simmons, Ennis & Co., who are opening a large placer claim in Waldo mining district, Josephine county, are making excellent headway, and by next season will no doubt have their huge cut finished and everything ready for piping on an extensive scale. Cornelius & Co.'s mill in Rock Point precinct will commence crushing quartz from the Swinden ledge in a few days. It has been improved and put in good order, and will no doubt do much better work than formerly. A large force is engaged in taking quartz from the ledge, which looks better than ever.

TRAIL CREEK MINES.—*Bedrock Democrat*, April 9: The *Democrat* was yesterday the recipient of a call from Messrs. Earnest Nadeau and John Laundry, who have just returned from a visit to the Trail creek gravel mines, whither they went for the purpose of seeing what the present outlook promises toward this season's operations on these mines. They report the prospects very flattering for a prosperous season, more water running in the ditches than at the same time previous years, and snow on the mountains on an average of six feet in depth. To give our readers a better idea of where these mines are located, we will state that they are due west from Baker City 40 miles, just back of the high, snow-capped peaks that can be seen towering toward the heavens as viewed from our city. They are situated in a low divide between Trail creek and the north fork of the John Day river, the water supply for the working of the mines being attained from the John Day by means of a canal six miles in length and with a carrying capacity of something over 800 inches. These gravel mines are owned by a company of experienced miners under the firm name of Powers & Co., and have been worked for many seasons past with most gratifying results. The gravel banks are to the depth of 60 or 70 feet and the pay dirt extends from the grass roots to bedrock. Operations for the present season will commence in about two weeks, and work will be carried on more extensively than ever. Two Little Giant hydraulics will be placed in position to drive against the immense gravel beds, and a force of some 12 miners to perform the many different offices required in a well-regulated placer mining claim, will successfully operate this valuable property.

UTAH.

PARK CITY.—*Record*, April 9: Surface water handicaps active work in the upper levels of the Crescent, but this trouble will soon be at an end, since the snow on the hills is fast disappearing. The three-compartment shaft that is being sunk on the vein at an incline from the end of the lower tunnel and way in the hill, is going down at a lively rate, having already reached a depth of nearly 150 feet. As soon as the large quantity of machinery arrives, about May 1st, no time will be wasted putting it in place, so that very soon advantageous development work on the Crescent will be pushed, and large quantities of high-grade ore extracted. Since the concentrator has had an overhauling its capacity has been increased to about 30 tons in 24 hours and still a large amount of ore could be treated. Yesterday Ezra Thompson's force of freighters was busy unloading four cars of hoisting machinery for the Daly mine. It will take several days to transport the lot, 50 tons, and daily the balance of the mining machinery, about 80 tons, is expected from San Francisco. At the mine, extensive preparations are going on to receive the mammoth machinery and put it up without delay. It is expected that the new hoisting works will be running by June 1st. A rich strike in the tunnel of the Rochester group was recently made. It is impossible to obtain the particulars of the richness or extent of the vein encountered, but enough is known to justify the assertion that very soon ore shipments will be inaugurated. The operations of the Rochester and the Southern Tier Co. will cause Snake creek to boom this summer. Fred W. Hayt, manager of the Southern Tier, is up at the mine examining the character and extent of the late strike, which is known to be as rich as at first reported.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court Department 10, San Francisco:

CRYSTAL SPRING WATER CO. April 8. Object, to supply San Mateo with pure water for domestic purposes. Capital stock, \$50,000. Directors—B. N. Morgan, S. L. Jones, R. E. Rammond, Edward Ziesche and F. R. Drinkhouse.

SIRIEX MARINERS' COMPASS CO. April 8. Object, to purchase, manufacture and deal in improved mariners' compass invented by Leon Siriex. Capital stock, \$750,000. Directors—E. P. Voisard, Leon Siriex, John L. Boone, C. E. McNear, Chas. Gaillard.

CALIFORNIA PRODUCTS EXHIBIT BUREAU. April 8. Object, establishing in this city a bureau for the collection and public exhibition of the products and the native manufactures of California. The Directors are John D. Wagner, S. A. Jones, John Holden, J. W. Miltoe, P. S. Donney, W. W. Brown and Alva Udell.

HERCULES COLD STORAGE CO. April 9. Object to operate in icehouses, ice machines, refrigerator cars, etc. Capital stock, \$150,000, in shares of \$20 each. Directors—Charles L. Taylor, D. E. Francis, P. J. White, Joseph W. Hostetter, Charles Alpers, George B. Mowry, John H. Miller.

EMIL QUARZ CONDENSED COFFEE MANUFACTURING CO. April 9. Object, to manufacture and sell condensed coffee. Capital stock, \$10,000. Directors, John Gray, August Kroeger, Emil Quarz, A. E. T. Worley, Thomas J. Haynes.

Mining Share Market.

There is not much new to report concerning mining strikes. They are inactive, and neither bullion shipments nor ore developments seem to be able to raise prices any.

All is again falling into regular working shape on the Comstock. At the Yellow Jacket mine 165 tons of ore are being hoisted daily; at the Crown Point 130 tons a day are being extracted and shipped, and at the Belcher 100 tons. At both these latter mines more miners will soon be put on and the output of ore increased to the full capacity of all the mills they are able to command.

The Savage ore-producing sections are yielding the usual quantity of excellent rock, and new deposits of great promise are being opened up.

At the Consolidated California and Virginia all is going on well and smoothly in the ore-producing sections. A furnace (the first of two that it is proposed to set up) for furnishing a supply of carbonic acid gas, by means of which to extinguish the smoldering fire in the vicinity of the 1500 level, is now ready for use. Either coke or charcoal will be used in it. Confined as is the smoldering fire in the old works by strong bulkheads on all sides, it is thought that the space can be filled with the gas just as a bottle is filled with water.

New York Metal Market.

Telegraphic advices dated April 14th give the following New York prices:

BAR SILVER—96 3/4 c per oz.
BOKAX—54 1/2 c.
COPPER—LAKES—\$10.40.
IRON—No. 1, \$32.00.
LEAD—\$4.30 to \$4.35.
QUICKSILVER—\$3.25 to \$4.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Neglected, spot closing at \$10.36 to —. Transferable notices (Lake) issued at \$10.35 to —. Transferable notices (Chili Bars) issued at \$10.30 to —. Lead—Dull at \$4.30 to \$4.40 spot. Transferable notices issued at \$4.35 to —.

Tin—Quiet at \$22.40 to \$22.50. Transferable notices issued at \$22.45 to —.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$22.75 to \$22.90; Billiton Tin, \$23.10 to \$23.40; Banca Tin, \$23.15 to \$23.50; Baltimore Copper, \$10.30 to \$10.60; Orford Copper, \$9.35 to \$9.70; F. S. C. Copper, \$10.00 to \$10.25; Foreign Lead, \$4.75 to \$4.80; Foreign Spelter, \$4.70 to \$4.75.

MAKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$21.00 to \$21.50; No. 2, \$20.00 to \$21.00; Grey Forge, \$17.00 to \$19.00; Hudson River, Grade No. 1, \$21.00 to \$21.50; No. 2, \$20.00 to \$21.00; Grey Forge, \$17.00 to \$19.00; Southern, Grade No. 1, \$21.50 to \$22.00; No. 2, \$21.00 to —; Grey Forge, — to —.

DELINQUENT NOTICE.

Gover Improvement Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment No. 2, levied on the 24th day of February, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Engene Dutilh.....	3	10	\$100 00
Eugene Dutilh.....	46	5	50 00
J. C. Haselton.....	36	10	100 00
A. Ogden.....	1	10	100 00
A. Ogden.....	45	5	50 00

And in accordance with law, and an order of the Board of Directors, made on the 24th day of February, 1887, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of said Company, on Tuesday, the 26th day of April, 1887, at the hour of 3 o'clock p. m., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

PATENT SOLICITORS.

252 MARKET ST. S. F.

ELEVATOR 12 FRONT ST. S. F.

Practical Treatise on Hydraulic Mining.
By A. O. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, burly-gurlys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tallings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

SILVER-PLATED AMALGAMATING PLATES

FOR SAVING GOLD

—IN—

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED:

Only Refined Silver and Lake Superior Copper used. Weight Guaranteed.

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of JOHN TAYLOR & CO., Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

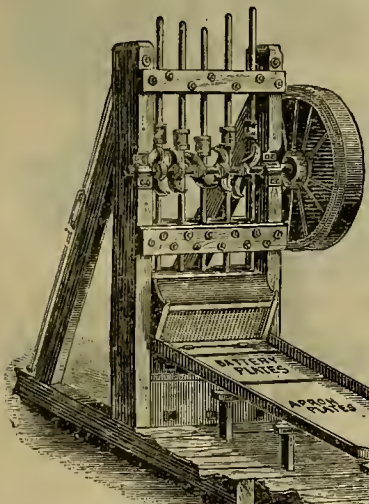

NOTICE.—My Silver-Plated Plates are well known, and in use everywhere. They still continue to assay at least one-quarter more silver for the same money than any plates made here. One trial of my plates in competition will prove this. Light, thin silver-plating looks the same as heavy, but has no durability.

KENDALL'S PATENT, AUGUST 24, 1886.

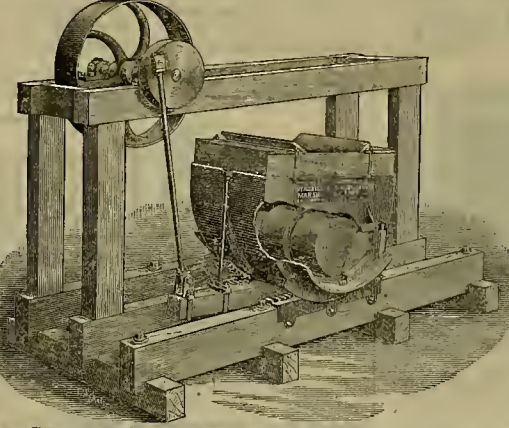

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

SEND for Circulars and Price List. MARSHUTZ & CANTRELL.

THE HAZELTON BOILER.

A NEW DEPARTURE AND RADICAL CHANGE IN FORM OF STEAM GENERATOR.

The Most Notable Improvement ever made in this Department of Engineering, affording a degree of Safety, Durability and Economy never before attained. Over 100 now in use, aggregating upwards of 13,000-Horse Power.

THE NEW YORK MUTUAL GAS LIGHT COMPANY has been running a 275-horse power Hazelton day and night for the past six years. Also five more, aggregating upwards of 1000-horse power, all carrying 125 degrees pressure. The Superintendent says: "Not a new tube has been put into any of them, nor have they required any repairs whatever. They do not scale, are easily managed, perfectly safe, and I consider them the best Boilers extant."

THE HUDSON GAS LIGHT COMPANY, of Hoboken, N. J., has used two 80-horse power for two years, running day and night, and the Superintendent says: "They have required no repairs and are in as good condition as the day they were completed. Are quick steamers and economical in fuel. The lowest grade of fuel produces and maintains for us not less than 100 pounds steam pressure, at which we always work."

MESSRS. ALDEN, SAMPSON & CO., OF NEW YORK, say: "The 200 and 350-horse power Hazelton Boilers which we have at our Works at New town, N. J., as well as the 40-horse power in use at our factory at Hallowell, Maine, are giving good satisfaction. We consider them very economical in fuel, easily kept clean, rapid producers of an abundance of dry steam, and perfectly safe."

THE JERSEY CITY STEEL COMPANY, of Jersey City, N. J., are using two 100 horse power, utilizing the waste heat from flue boilers. The Manager says: "Each Boiler gives us from this waste product nearly 100-horse power, after passing through a 30-foot Flue Boiler. They require no repair, we experience no trouble in keeping them clean, and they are every way satisfactory. The quantity of fuel to produce a given result is decidedly less than any Boiler we have ever used."

The Superintendent of the LA LUZ MILLING CO., OF GUANAJUATO, MEXICO, after using a 70-horse power for a year, says: "I have run it with the worst water I have ever seen put into a Boiler without experiencing any trouble whatever. In the matter of economy, nothing can equal it. The 70-horse power Hazelton used only half as much wood as the 25-horse power Tubular Boiler which it replaced, developing twice the power. I see nothing to indicate that it will not be the most durable, as I believe it to be the safest and most economical Boiler now in use. I have had nearly 20 years' experience with all kinds of Boilers, and give the Hazelton preference against all competitors. In fact I told my company that we could not afford to run the ordinary tubular or any other kind of Boiler if they were put up in our Mill free of cost. I have ordered three more of 75-horse power for the new Mill of this Company, now being erected."

HENRY DISSTON & SONS, OF PHILADELPHIA, the well-known saw manufacturers, after running a 60-horse power Hazelton for ten months, ordered seven more for their works in Tacony, Pa. The General Manager says: "The 60-horse power Boiler bought fourteen months ago has developed an average of 85-horse power, and it has not scaled or given us a particle of trouble. We consider them the best Boilers made."

THE WEYMOUTH PAPER MILLS OF NEW JERSEY, after running a 100-horse power about a year, say it gives perfect satisfaction, and they consider it the best Boiler made. Steam dry; also works much beyond its rated capacity.

Reference is also made on this Coast to the California Cotton Mills at East Oakland, running a 150-horse power. Also to the Black Point Pumping Station of the Spring Valley Water Works, San Francisco, running a 200-horse power, and the Southern Pacific R. R. Co. running a 75 H. P.

 GEO. H. STRONG, }

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enabled us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

Portable and Durable.

WEIGHT, 4 TONS.

It is a full fledged Quartz Mill without gearing, cone or pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working.

Nautical Science.

The Chamber of Commerce of this city has petitioned the Regents of the University of California to establish a department in nautical astronomy and practical navigation. This would be another step toward the practical, which seems to be the present tendency in educational matters. To a seahoard region like this it would seem to be a necessity. But this has been one of the neglected studies. A great deal of money is expended on mere theories, and it is but right that something in the practical direction indicated should be done. The proposition was made by Capt. Wm. H. Parker, and it is to the effect that at the university there should be established a Chair of Nautical Science; and that primarily the student should be instructed in elementary and nautical astronomy and the science of navigation, the first objects being to make the student a good, practical and intelligent navigator.

After this success is secured, the idea is to enlarge the subjects taught to some knowledge of shipbuilding, cannon and naval tactics. And this because Congress, in giving the land scrip to the agricultural colleges, especially required them to teach military tactics (the object being to prepare our citizens to defend the soil); and as our next war must inevitably be fought principally on the ocean, it is only right that some of our young men should be educated to constitute what we may call the naval reserve.

The Chair of Nautical Science would not necessarily be confined to those actually preparing to enter the merchant service, but would be open to all. Nautical astronomy is as necessary to a liberal education as is practical astronomy, and there is no reason why one should, in making a voyage, look upon the art of finding the ship's position at sea as a mystic operation, or be unable to understand why the day is changed in going from San Francisco to China. Moreover, it is believed that lectures on naval history, salvage, protests, contracts, rights of search, collisions, law of blockade, etc., would not only interest the general student, but would be absolutely essential to those intending to become admiralty lawyers.

One of the editors of the PRESS some time since suggested to one of the Trustees of the Stanford University to bring this subject to the attention of Senator Stanford, with a view to his establishing a Chair of Nautical Science there, and providing opportunities for constructing and testing models of vessels. It is too soon, however, to look for any action in that quarter. The petition of the Chamber of Commerce will cause the University Regents to look into the subject. The study suggested is a practical one and would benefit many.

THE Lexington mines are located on and about Alamo mountain in Ventura county. The Frazier mines are about a few miles distant, but in Los Angeles county. A spur of the Alamo mountain runs north into the latter county, in which the Cedar mining district is located. There are three quartz-mills in constant operation in the latter district.

THE Cour d'Alone Water & Mining Company has ordered the necessary pipe and hydraulic giants for the purpose of operating the placer ground on the point of Bear gulch, opposite Raven, and will commence operations as soon as the weather will permit.

Electricity and Ores.

We recently mentioned the tests made of Dr. Rae's electric process in the working of ores at the mill of J. M. Douglass & Co., Dayton, Nev. Experiments were at first made on tailings, to see if the mercury contained therein could be put in a condition so as to be collected and saved. When these experiments were successful, tests were made with the pulp in the pans to endeavor to prevent the loss of mercury and amalgam, which their presence in the tailings showed was going on. This was considered to be mainly due to the "flouring" of the mer-

THE ECONOMIC QUARTZ MILL, ROCK BREAKER AND ORE FEEDER.

cury, so common in all mills where pans are used. We gave the details of the results of these tests at the time. They were so successful that a more complete plant was contracted for and put up at the mill, so that long-continued work with the system might thoroughly prove its efficiency.

We received this week a letter from Wm. A. Rulison, superintendent and assayer for J. M. Douglass & Co., Dayton, Nev., in which he says:

"Douglass mill started up on Wednesday, April 13th, and we have gradually increased until now we are running 16 pans (full capacity of mill) and 12 settlers on 135 tons per day. The Rae system is apparently working better than on the test run of 52 tons, made some time ago. We have also applied the electric system to our cleanup pan running on blanket tailings, and the results are beyond our most sanguine expectations, throwing down every particle of 'flour' quick."

PROF. JOSEPH LE CONTE, of the University of California, is announced to address a meeting of the National Academy of Sciences at Washington on the subject of "Some Phenomena of Binocular Vision."

Donations to the Mining Bureau.

The following are among the recent additions to the Museum of the California State Mining Bureau:

Silver ore from Carson Creek mines, Calaveras Co., Cal., by S. L. Burbridge.

Sandstone—A very fine building material; large dressed block and specimen in the rough; Blacklock quarry, Curry Co., Oregon, from the company.

Fossils from Sailor canyon, Placer Co., Cal., J. R. Sanborn.

Volcanic dust from the great eruption of

A Small Quartz-Mill.

Of late there has been so much demand for small ore-crushing plants that inventors and manufacturers have been giving considerable attention to such things. We illustrate on this page the James' patent "Economic" quartz-mill, with rock-breaker and automatic ore-feeder. This appliance was first invented by a practical miner, but it was not until quite recently that it was improved and patented in its present form, so that it is now in reality a new machine presented for the first time to the consideration of miners.

It is simple in construction, composed of few parts—strong and durable—and combines the advantages of the regular stamp-mill and arrastra, both as a crusher and gold-saver, while the price is so low as to place it in the reach of all. There is no part of the Economic mill that can get out of order, and there is no wear except on the shoes and dies. The operation is a reciprocating one, requiring very little power, for gravitation does half the work, the effect being to throw the weight of the shoe-block (1200 pounds) in unison with the force of the reciprocating power alternately and separately on each shoe, thus creating sufficient agitation to expel the pulp as fast as it is reduced, while the gold is returned in the mortar in amalgam. The result is substantially the same as obtained in the regular stamp battery, which is known to be the best gold-saver.

The construction of the mill is such that it admits of a high rate of speed, say from 150 to 175 revolutions per minute of the shaft. This gives from 300 to 350 strokes, and as there are four shoes, from 1200 to 1400 strokes of the shoes per minute are given. The action of the shoes is practically that of the stamp in coming down, but after they strike there is a sliding motion which tends to grind the ore. Running at this high rate of speed, it must be evident that the mill will do a fair amount of work and that the agitation will be ample to expel the pulp.

Messrs. Tatum & Bowen, of this city, the manufacturers, state the capacity at from 6 to 10 tons per 24 hours. They have arranged also to make double or triple mills—that is, two or three rockers are placed in one mortar, which, of course, increases crushing capacity in proportion. The screens are on the two opposite sides of the mortar, on the line of the throw, so there is a double discharge, where two or more rockers are used. The rock-breaker is of a capacity of about 24 tons per day. Mills can be ordered without the rock-breaker, if desired, but, as shown in the cut, the whole makes a complete milling plant. The automatic ore-feeder is not plainly shown in the cut, but it is all that is required to feed the ore automatically. The mill complete weighs 2400 pounds. The rock-breaker weighs 800 pounds. About 4-horse power is required to run both machines. The mortar is 17 inches by 36 inches. Height of mill, 5 feet; length of screen, 24 inches. The prices are given in the advertisement in another column.

SUB-TREASURER BROOKS is at a loss to know what to do with incoming coin. The vaults contain \$22,000,000 in standard dollars, \$28,000,000 in gold and \$7,300,000 in currency.

LIEUT. CHARLES W. DANENHOWER, the Arctic explorer, shot and killed himself at the U. S. Naval Academy on Wednesday last.

Tarawera, New Zealand, June 10, 1886, Mrs. A. E. Bush.

Fossils from the Tassajara valley, Contra Costa Co., Cal., G. W. Martin.

Eggs and horns of the horned shark, San Pedro, Cal., Benj. Hill.

Rich silver and copper ores (Peacock copper), from New Mexico, Chas. Kaufman.

Stream tin concentrations from Dakota, Melville Attwood.

Silicified Wood—Large specimen of the root of a tree or hush, Sonoma Co., Cal., W. L. Watts.

Gold Quartz—El Dorado Co., Cal., T. Davidson.

Silver Ore—Tepetste mine, Mexico, E. Wolleb.

Silver Ore—Very rich; Jesus Maria mine, Mexico, M. A. Wheeler.

Lower jaw and teeth of mastodon, Mexico, fine specimen, J. Z. Davis.

THE Port Townsend Argus says there were 43 lumber cargoes carried away from Puget sound during March, aggregating 27,249,043 feet and valued at \$379,202. The increase in coal and lumber shipments is large and gratifying.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ems.

Fracture of Glass Tubes.

EDITORS PRESS:—In the *Scientific American* of the 9th of April attention is called to the fracture of a glass water gauge on the boiler of a locomotive; and as the subject was referred to in the MINING AND SCIENTIFIC PRESS of December 13, 1884, in a communication entitled "Fracture of Glass Tubes," the cause of such fractures seems to remain open for discussion, or, what is much better, it invites discovery. The regularity with which water gauges are broken, when a No. 16 brass wire is pushed in and withdrawn from the tube, demonstrates the existence of a law; this law may be as old as creation and as wide as the universe.

The time intervening between the contact of the wire with the inside of glass tube and the resultant fracture of the tube varies from 5 minutes to 12 hours; but in all of my experiments no tube failed to break, and there was a suggestive similarity in the curvilinear lines of fracture.

The cut represented in the *Scientific American* has spiral lines of such mathematical exactness as to excite doubts as to its being absolutely correct. But the tendency to break in curved lines is marked in my experiments.

My theory now is, that the latent molecules of electricity in the glass tubes may be polarized or set in action, by which each atom might exert force in changing its poles; and if this were done, the rigid, brittle nature of glass would break on lines of greatest force or least cohesion, when metal would only expand according to recognized and demonstrated laws. (See Tyndall's "Notes on Electricity," p. 137.)

Prof. Davidson tried an experiment with copper wire on two glass tubes. In each case the tube was cracked in 24 hours, and although the character of the cracks may be a remarkable coincidence, yet each tube had a circular crack at the ends, with a longitudinal crack connecting the rings.

In Colorado, the fractures (when brass wire was used) might follow in five minutes, and seldom exceeded five hours; and the separation of the glass immediately followed the lines of cracks which quickly ran through the tube when the fracture commenced.

In San Francisco and vicinity, the fracture is similar, but seems to occur much later than in Colorado.

If the fracture of glass tubes, under these conditions, be regarded simply as an empirical fact, even then the experiment is interesting, and a careful investigation may lead to important results. The brass wire which was used with greatest effect in my experiments was shaped like a helix, and enough wire unwound to pass through the tube.

EDWARD E. CHEVER.

From Nogales, Arizona.

EDITORS PRESS:—The usual February rain was omitted this year, and the agricultural, mining and stock interests of Arizona and Sonora began to suffer. A couple of days ago we had a little rain—not enough to do much good. Now it is snowing. March was so warm that stoves were discarded and extra quilts relegated to their summer depositories. We all thought summer had set in, though somewhat early. The weather changes here from hot to cold and the reverse, with great suddenness and frequency, in spring and fall.

The building of small honeys still continues, though general business is only fair to middling. There is considerable activity in Sonora mines and prospects, denunciations being made at the rate of ten per day in Magdalena district. The Nogales smelter stopped some time ago for want of ore, and though there is now a pretty good stock on hand, it will probably not blow in for some weeks yet. The company has been buying silver ore on a falling market, and is, perhaps, in no hurry to realize. The fall in silver is bad for the retail trade here, as that is all done in Mexican coin, which sympathizes with the rise and fall of bullion.

An effort has been made by the residents to cleanse the village, and considerable benefit has resulted. There is also a movement toward incorporation, but serious doubts are entertained by many as to whether an incorporation would have any better effect than to saddle the community with the maintenance of a gang of political bummers and papsuckers and a heavy debt.

The recent border trouble has led to the encampment of a company of U. S. infantry a mile from town, where, in case of another disturbance, they would be of little use, as the half hour or so which would elapse before they could be summoned to the scene would probably be about all the rioters would require. But it seems that the discipline of the U. S. army is not such as to admit of the quartering of a garrison or guard within a mile of a whisky-shop.

Rohrbies have been rather frequent of late, and there are a good many cases of smallpox on both sides of the line, though but few have, thus far, been fatal. The want of municipal power on this side, and of proper laws (or the

enforcement of such) on the Mexican side, make it impossible to control an infectious disease by the isolation of patients. Fortunately, the natural salubrity of the place operates to prevent epidemics; moreover, not all of the cases reported as smallpox prove to be such, for if a person exhibits any kind of cutaneous eruption, he or she is held to be guilty until innocence is proved, and must move out or the residence is *flagged*. Our doctors don't seem to be very expert at diagnosing smallpox, as they have declared several persons affected who were no more so than the writer is now.

On the whole, Nogales is slightly progressive, and there are worse, as well as better, places in the world. X.

Nogales, April 12, 1887.

Mercury.

[Translated for the Press.]

There are only four localities where mercury or quicksilver is found in abundance. These are California, Austria, Almaden in Spain, and Peru. The mines in this latter place were discovered in a very curious manner. Cinnabar, the soft and reddish rock of which mercury forms a part, when ground very fine serves as a beautiful red paint.

The Indians used this to adorn their bodies. This caused the country where they were living to be examined for cinnabar. The Romans had used it for hundreds of years in the decoration of their images. It is of great value now, in our times, and we call it vermilion. The other part of the rock is composed partly of sulphur. The cinnabar is crushed and exposed to heat. In the meantime, mercury in the form of vapor passes into a vessel framed for the purpose, where it cools. After being reduced to this liquid state it is pure and is in condition to use.

In this form it is used largely to separate the metals from the rock to which they adhere.

The rock having been well crushed, the material is passed through a screen and is washed to obtain all the gold and silver possible. Quicksilver is then placed in it, which appears to be absorbed at once, and as it takes up or moves with the metal in the ore, this metal is separated from the sand or crushed rock. If gold is the metal that is to be amalgamated, a yellowish-white amalgam will be found. This is heated in retorts and the mercury or quicksilver disappears, leaving the gold. Although mercury is so useful in many ways, it is also poisonous, its vapor being dangerous to inhale. It is not many years since the mines of Austria took fire, poisoning 1300 laborers, many of whom eventually died. Even the water used to extinguish the flames, and which passed into a river a short distance from the mines, killed the fish.

The mercury is transported in some countries in sacks made of dressed sheepskins, but is mainly carried in cast-iron flasks.—*From El Minero Mexicana.*

CRYSTALLINE STRUCTURE OF IRON METEORITES.—From an exhaustive study of the very large collection of meteorites at Harvard College, Mr. O. W. Huntington concludes that many of the masses of meteoric iron now known are cleavage crystals, broken off probably by the impact of the mass against the atmosphere. These masses show cleavages parallel to the planes of all the three fundamental forms of the isometric or regular system. The Widmanstätten figures and Neumann lines are sections of planes of crystalline growth parallel to the same three fundamental forms of the isometric system. On different sections of meteorites, Widmanstätten figures and Neumann lines can be exhibited in every degree, with no break where a natural line of division can be drawn. The features of the Widmanstätten figures are due to the elimination of incompatible material during the process of crystallization. The results of this investigation confirm the theory that the process of crystallization must have been very slow. The most probable theory of the origin of meteorites seems to be that these masses were thrown off from a sun among the fixed stars, and that they were slowly cooled while revolving in a zone of intense heat.

STATIONARY ENGINEERS.—The Stationary Engineers' Association, which meets at Huddy's hall, has received applications for leave to organize branches at Hollister and San Diego. The secretary was instructed to enter into correspondence with that object in view. With the organization of these branches the engineers will have five associations in the State, the parent being in this city, and two branches at Sacramento and Eureka. The method of initiation is rather a novel one, unlike that of any similar organization. The applicant is required before acceptance as a member to give practical proof of his competency in open meeting by putting into shape the dismantled pieces of a horizontal slide-valve engine which is brought into the assembly-room. Besides this practical test, which is always insisted upon, the member must also answer questions as to his theoretical knowledge.

A STEAM WAGON that runs on ordinary roads and hauls 30,000 pounds is making successful trips between Bisbee and Fairbank, Arizona. The distance is 60 miles and the trips are made wholly by daylight. The wagon is owned by the Copper Queen Mining Company.

Mining Parlance.

It is surprising to see what ignorance is displayed every day by the so-called "mining men," not particularly of this camp, but generally speaking throughout the entire West, in their lack of knowledge of the rudiments of mineralogy. It is as essential that a mining superintendent should know what kind of formation he is working in, and what minerals are in his ores, as it is for a carpenter to know what kind of wood he is finishing a room with. Not long ago we overheard a prominent mining man asking a friend of his, "what kind of iron ore is manganese?" His friend being a much younger man, and realizing the position occupied by the questioner, answered rather reluctantly "that iron was one element and manganese another," and "that there would be just as much sense in asking what kind of silver ore is gold." Persons charitably disposed might say that "this is only one instance out of a hundred." Yes, that may be; but when you see a man, in whom you have all the confidence in the world, look at a piece of clay and give you as his opinion that "it is a fine specimen of decomposed chloride of silver," it rather opens your eyes, to draw it mild.

And again, when an ex-dry-goods clerk, but now a mining superintendent, speaks of a kind of ore as containing the "chloride of carbonates," you feel like presenting him with a "Dana," or better still, wishing him back to where he belongs—in a dry-goods store.

The conclusion of all this is, that the directors of mining corporations evidently think that any one can superintend the sinking of a hole in the ground, and they send Tom, Dick or Harry out to do it, whether he be a bookkeeper, dry-goods clerk or a general "Jack-of-all-trades." And it will so continue until the corporations realize the enormity of the duties of a superintendent. We have not the space to enumerate them all, but we think it quite essential that he should be at least familiar with the material in which he works, for in the misusage of mineralogical and mining parlance he not only sets himself at ridicule, but also the company which he represents.—*Tombstone Democrat.*

NYE COUNTY MINES.—The Belmont (Nev.) *Courier* says: The outlook for a revival of mining in Nye county is extremely encouraging. Ophir continues to give forth a steady stream of bullion; the new Cincinnati Company of Union district is adding its quota to the silver product; the Barcelona mine at Spanish Belt continues to yield rich ore which is shipped to Salt Lake for reduction; in Philadelphia district the Belmont mine is producing high-grade ore, and so also is Latty's mine; the mines of Tybo are looking well, and are now in shape to produce large quantities of good-milling ore, and the mill will be ready to drop stamps about the 1st of May; the chloridizers in the Ione mines are extracting fine ore, and J. B. Massey and A. Lsbeau are shipping rich ore from Lodi. Nye's mines will be extensively worked this year, and work will be resumed on mines that have long lain idle, early this summer. The mineral here in vast quantities and patiently awaiting capital and enterprise to extract it and turn it into bullion. Mining will always pay in Nye when the work is prosecuted in a legitimate manner.

THE GREAT FLUME AT SAN DIEGO.—It can now positively be stated that the flume company has succeeded in placing \$600,000 worth of bonds, and the great work of bringing mountain water from the headwaters of the San Diego river to San Diego, a distance of 36 miles, will be pushed to completion. The last \$10,000 worth of bonds has been taken by the College Hill Land Association, which owns 1200 acres of land on the mesa near the city, for a college site, and which by this means secures a water supply. The contract for grading the flume line has been let and the contract for building the flume has been taken by Moore & Co., of San Francisco, who have contracted for the 7,000,000 feet of lumber required for the flume. The placing of bonds removes the last obstacle to the completion of this great enterprise, upon which \$150,000 has already been expended to insure an abundant supply of pure mountain water for domestic and irrigation purposes.

A CALIFORNIA MARBLE QUARRY.—It is said that on the banks of the South Yuba, about four miles from this city, there is a deposit of granulated limestone or marble. We have heard of it before, and once, while on a prospecting trip, we saw the alleged marble quarry but we did not examine it closely, as we were then skeptical on the subject of the existence of limestone in that section. We understand that during the past winter the owners of the mining claim upon which the alleged marble is found quarried out some of the rock, and they pronounce it a first-class article. We cannot vouch for the correctness of their judgment. We have seen close formations that, on the surface, very closely resembled limestone, and in the absence of proper tests might pass for such. We shall investigate the matter at our earliest opportunity, and report. If there is a marble quarry there, it might be utilized.—*Nevada City Herald.*

STEPHEN RICKARD, M. E., who has been for some time at Mezquital del Oro, Mexico, has gone to Denver, Col.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SULPHUR SPRINKLER.—John Fatjo, Santa Clara. No. 360,571. Dated April 5, 1887.

This invention relates to a device for sprinkling sulphur upon vines, so as to protect them from the ravages of insects and parasites. It consists of a double conical vessel, the smaller portion of which is centrally located, one end being beveled and provided with a gauze or screen sprinkler, and the other end having a screw-cap through which the material may be introduced.

SCREEN BOTTOM FOR CHARCOAL WASHING AND FILTERING TANKS.—Albert Gaukröger, S. F. No. 360,581. Dated April 5, 1887. This relates to a screen bottom to be used in connection with the tanks in which the charcoal used for purifying purposes in sugar-houses and elsewhere is washed and filtered. It consists of a suitably shaped casing, having fine perforated or other screen material upon its upper and lower surfaces, and in combination with this a filling of coarse sand or fine gravel introduced into the bottom of the screen and between these surfaces.

PIN-RAIL ATTACHMENT FOR VESSELS.—John McKeown, S. F. No. 360,535. Dated April 5, 1887. This invention relates to that class of attachments for vessels which are used for guiding the lower end of the tackle known as the "burton," which is used in unloading; and the invention consists in cylinders or drums above and below the pin-rail, and secured thereto by means of a bolt passing through them and through the intervening pin-rail. The invention consists further in the peculiar construction of these drums or cylinders and the means for fastening them in place. It is the object of the invention to provide a bearing surface upon which the end of the "hurton" is guided and slips, of such a character as to reduce the friction and thereby save the rope.

ELEVATOR.—Henry Albert, Crescent City. No. 360,604. Dated April 5, 1887. This safety appliance for elevators may be briefly described as follows: In each side of the top of the cage is pivoted a weighted balanced catch, the outer end of which comes in contact with, and, under ordinary speed, slips by the successive bars or stops of the rack in the elevator well or shaft. When the cage attains an undue speed in its descent the contact of the catches becomes so severe as to throw them beyond their centers of gravity, causing them to make a complete half-turn, in which position their reversed ends, the one resting on the rack-bar or stop and the other on a fixed stop on the cage or car, effectually arrest the descent of the cage. In connection with these balanced swinging-catches there are several other features of importance. There is also a further feature—namely, the sliding spring-controlled or cushioned cross-head or bar by which the reversible catches, the fixed stops, and the balanced stops are carried, whereby the jar occasioned by the sudden arrest of the cage is wholly obviated and relieved.

PHOTOGRAPHIC APPARATUS.—A. P. Whittell, S. F. No. 360,499. Dated April 5, 1887. This invention relates to improvements in the apparatus for taking photographs, by which each sensitized plate has its portable folding camera attached, and the use of lenses for focusing the picture is obviated. The objects of these improvements are to make each sensitized plate a complete camera without adding greatly to the weight or bulk of the plate, and which will be ready for immediate use at all times and places; also, to lessen the cost of portable photographic apparatus for popular use, and facilitate their manipulation by the amateur and inexperienced, who may by their use always obtain a good image, as no focusing of the apparatus is required. These objects are attained by the following means. In a light tight folding box, made of paper or other suitable material, a diffraction image is produced upon a sensitized plate by admitting the light, which is reflected from the object to be photographed, through a minute aperture in the apparatus, placed at a suitable distance from and opposite to the surface of the plate, the size of the picture being varied by the distance at which the sensitized plate is from the aperture, relatively to the distance of the aperture from the object being photographed, the image, under the varying circumstances, remaining always clear and well defined.

EXECUTION BY ELECTRICITY.—The last Legislature of New York appointed a committee to examine into the most expedient method of inflicting the death penalty in cases of murder in the first degree, and to report on the subject to the present Legislature, whether by gall or otherwise. It is stated that the committee agreed to recommend the abandonment of hanging and the substitution of an electric method.

C. X. HOBBS, well known in this State, and latterly a superintendent of mines in South Africa, was killed there a few weeks since by Jeff McClelland, formerly of the Comstock, but now superintendent of the Filgrim creek mines, Tranevaal. The men had quarreled.

An Upland Loco-Weed.

In the PRESS of Nov. 6, 1886, we gave an engraving and description of a loco-weed occurring in Colorado and New Mexico, botanically known as *Astragalus mollissimus*. Upon this page may be seen another loco plant more common than the preceding and found in abundance on the high plains and in the mountain ranges from British America to Mexico. Its botanical name is *Oxytropis Lambertii*. Although the titles are apparently quite different, the plants are really closely related. Dr. Aea Gray, writing of the two plants named in the *American Agriculturist* some years ago, said:

All the plants sent for identification and said to cause loco poisoning have been of the Leguminosae and of the *Astragalus* tribe. The species to which this damage is attributed in the plains of Colorado proves to be the *Astragalus mollissimus* of Torrey—a very downy species, as its name indicates. We never found this species on the mountains. But there the same ill effects are charged upon plants of similar appearance, belonging to a nearly related genus, *Oxytropis* mainly to *O. Lambertii*, which abounds at all elevations up to 8000 or 9000 feet. The botanical difference between these plants is so little that they might all be counted as species of *Astragalus*, but there is reason to think that this particular *Astragalus* of the plains of Southern Colorado is much the most dangerous. For this species is not found as far north as Wyoming and Nebraska, where the *Oxytropis* abounds on the plains; and there we never heard of this trouble.

These plants are all of the legumes or pea family, and the fact of their injurious character gave Dr. Gray occasion to write this very interesting history of the pea family:

There was a prevalent notion that plants of the pea tribe (*Papilionaceae* plants) generally are innocent, if not wholesome. No one suspected a tribe which gave us peas, beans, lentils and the ubiquitous peanut, and supplies such fodder as clover, medick, lucern, vetch and cow-pea. In the first edition of his "Natural System," Lindley wrote: "The general character of this tribe is its nutritious, or, at least, wholesome, properties." Later, the note is changed, and in the "Vegetable Kingdom" he declares of the order "that, upon the whole, it must be considered poisonous, and that those species which are used for food by man or animals are exceptions to the general rule, the deleterious juices not being in such instances sufficiently concentrated to prove injurious." What a pity that our cattle are not better acquainted with the corrected rule! In Europe and in the Atlantic States no harm is known to come to cattle from want of proper discrimination. But when European flocks were taken to Australia, and to pasture and forage almost wholly new, thousands of sheep perished in the Swan River colony in consequence of cropping the leaves of some leguminous plants to which they were attracted. What made the matter worse for the botanists was that the very plants which did the mischief had been recommended by one of them (Mr. Preiss, a German) as the best thing the agricultural society could cultivate as artificial food for stock. But another botanist, Drummond, a canny Scotchman, got up some experiments and proved that the people were right in charging the damage to these very species (of *Gastrolobium*) which the German botanists on general principles expected to be innocent and useful. The same plants are fatal to goats and even to cows and horses. The symptoms, as described, are almost exactly like those produced by the loco-weed. In other parts of Australia, species of a different genus (*Swainsonia*), very like *Astragalus*, and like the bladder senna (*Crotalaria*), destroy cattle in the same way.

It is recorded that the poison plants of Australia were found on analysis to contain a poisonous alkaloid, apparently *Cytisin*, to which the injurious properties are attributed. It was thought chemical analysis might show something similar in our loco plants, but so far the analyses made do not disclose it. The plant shown in the engraving, *Oxytropis Lambertii*, grows in strongly rooted clumps, has an erect habit. The leaflets are about one inch long by one-fourth to one-third inch wide, and are hairy, especially upon the upper surface. The flower stalks (says Dr. George Vasey in his description) proceed from the root stock and are usually 9 to 12 inches long, and naked except near the top, which has a rather close and thick cluster of flowers, much like those of the *Astragalus* in general appearance, but differing in some minute characters which separate it into another genus, and are succeeded by erect lance-oblong, pointed pods of about an inch in length. The flowers are subject to much variation in color, some varieties being purple, some yellow and others white.

WHITEFISH EGGS.—J. D. Redding, special agent of the United States Fish Commission has received a letter from Charles R. Buckland, agent of the New Zealand Government in this city, that the 10,000 whitefish eggs sent from here had crossed the equator in excellent condition, and that it was the most successful shipment ever sent to the colony. This is the first successful attempt in crossing the equator with fish-ova after transportation by land for a long distance. The shipment was originally from Western New York and New England waters, and the eggs were repacked here at the suggestion of Mr. Redding by James A. Richardson.

Copper Mining at Spenceville.

About seven months ago, believing the ore body to be exhausted and for other reasons, underground work at the Spenceville copper mine was suspended and the men sent to the company's copper mine at Campo Seco, Calaveras county. But a difficulty has been presented in the fact that the ore from this mine does not yield satisfactorily under the process used at Spenceville—burning and leaching and then precipitating the solution. Experiments are now being made to the end that a satisfactory and remunerative result may be secured. Pending the result of those experiments, the

Campo Seco ore is found, underground operations at Spenceville will not be resumed, but the water will be "forked" every year and the solution precipitated. This would require the services of but two men. If, on the contrary, a remunerative process for working Seco ore is not obtained, then the Spenceville mine will be further prospected in the hope of finding the rich body of ore which is thought to exist in the vicinity and from which the water obtains its solution.

When underground operations were stopped at Spenceville, there were many thousand tons of ore on the different dumps. Five or six men have been at work right along attending to the burning, leaching and precipitation of the same. A yield of about \$5000 per month has been ob-

A LOCO PLANT—*Oxytropis Lambertii*.

men have been sent back to Sweetland and orders given to pump out the mine and prospect for a new ore body.

The work of "forking" the water commenced about six weeks since. A pump is not used, the water being hoisted out of the mine in a large automatically acting tub, holding 200 gallons. The water was seen to be very green, showing the presence of copper in solution. It was determined to run this water through the boxes, which are filled with scrap iron, thereby causing precipitation—separating the water from the copper. This was and is now being done and it was found that from every 1000 gallons of water $7\frac{1}{2}$ pounds of copper cement, worth about $7\frac{1}{2}$ cents a pound, is obtained. The water is being taken out at the rate of 1000 gallons every five minutes, so it may be seen that quite a large amount of the copper cement is obtained every 24 hours.

If a satisfactory process for working the

tained thereby, and it will require some three months more to treat the remaining ore.—*Grass Valley Tidings*.

MATTERS in Bodie district are very quiet. Arrangements are about completed for increasing the capacity in the pumping machinery at the Lent shaft, so as to free the lower levels of Bodie Consolidated and Mono of water and do some deep prospecting.

The payrolls of the Comstock mines and mills for March aggregated \$203,838, a material falling off from February, caused by the shutting down of several mines and mills. It is thought the April payroll will reach \$250,000.

The introduction of water-power into the Grass Valley district for the purpose of operating the machinery of the quartz mines is working a revolution in favor of that industry.

Yield of the Comstock Mines in 1886.

There is a tax on the bullion product of the Nevada mines. Quarterly returns of ores raised and milled by the various corporations have to be made to the assessor in each county for that purpose. The Comstock lode is in Storey county. There are scores of mines on that lode, and developments are constantly going on in many of them. Not over half a dozen, however, have anything to report to the assessor for taxation. For the last quarter of 1886 these returns were as follows:

	Tons.	Average.	Bullion.
Belcher.....	10,750	\$8 33	\$89,420
Crown Point.....	10,838	9 31	101,434
Con. Cal. & Virginia.....	31,653	25 45	805,535
Kentuck.....	3,238	12 70	41,141
Savage.....	169	11 40	1,824
Yellow Jacket.....	16,505	10 04	165,724
Totals.....	72,692	\$16 57	\$1,205,082

For the same quarter in 1885, says the *Bulletin*, the same mines, with the substitution of Lady Bryan (196 tons) in place of Savage, reported a gross product of 60,471 tons ore raised, valued at \$749,897, showing an average of \$12.40 per ton. The comparison shows an increase of over 12,000 tons raised and nearly \$500,000 more bullion produced. The best average for the last quarter of 1885 was \$15.20 for the 21,150 tons from the Consolidated California and Virginia mine. In the last quarter of 1886, this mine produced 50 per cent more ore, which showed an increase of \$10.25 per ton average. This is certainly encouraging to those who have been toiling against adverse circumstances for so many years.

The quarterly output of the above mines for 1886 was as follows:

Quarter ending	Tons.	Average.	Bullion.
March 31.....	68,288	\$12 00	\$816,465
June 30.....	76,703	10 40	793,194
September 30.....	51,103	11 95	610,785
December 31.....	72,692	16 57	1,205,082
Totals.....	268,786	\$12 77	\$3,430,526

The mines contributing to the above result were as follows:

	Tons.	Average.	Bullion.
Belcher.....	37,221	\$10 17	\$379,507
Crown Point.....	37,973	11 03	417,370
Con. Cal. and Virginia.....	119,708	14 40	1,768,290
Kentuck.....	12,467	13 63	170,481
Overman.....	1,740	10 32	17,955
Savage.....	2,162	21 17	45,788
Yellow Jacket.....	57,410	10 00	574,100
Totals.....	268,786	\$12 77	\$3,430,526

Substantially the same mines in 1885 produced 228,004 tons ore and \$2,895,249 in bullion, showing an average of \$12.70. The best average for that year was \$14.63 for 59,500 tons from the Con. California and Virginia mine. The Comstock mines did better last year than they have for a long time. Some six or seven months ago, the Con. California and Virginia mine began to show an increased yield of higher grade ore, and during the last six fiscal months the superintendent has sent to the office bullion to the value of \$1,933,602, of which \$765,698 was in gold and \$1,167,904 in silver. The value of the silver is given on the old and artificial basis of \$1.29 per ounce, whereas its gold value has not averaged much over \$1 per ounce. In 1883 the product of 11 Comstock mines was \$1,875,547 from 124,599 tons ore, showing an average of about \$15 per ton. Reduced cost of crushing and increased ore output has enabled the California mine to pay four dividends in the past four months, amounting to \$432,000.

Silver Coinage in March.

The coinage of standard dollars in March amounted to \$3,020,380. This is the largest amount yet turned out for any single month since the resumption of coinage in March, 1878. The amount is nearly one-half as large as the total silver dollar coinage in the first 80 years of the history of this coinage. Last October \$3,000,000 was coined, but that was the first month the amount had gone up to that figure. The law requires that not less than \$2,000,000 nor more than \$4,000,000 shall be expended monthly for silver bullion for silver dollar coinage. The utmost limit has never been reached. The aim of the department has been to keep as near the minimum as possible. The law authorizing the redemption of trade dollars provides that they shall be converted into standard dollars independent of the law of 1878. We may, therefore, look for an increase in the silver coinage for some months. The amount of standard dollars in Government vaults now exceeds \$200,000,000 for the first time. There is now more silver coin than gold coin under the control of the Government. The amount of standard dollars made from March 1, 1878, to March 31, 1887, is \$258,545,977. This amount is disposed of as follows:

In circulation as coin.....	\$ 56,873,605
In circulation by certificate.....	131,930,489
Total in circulation.....	\$188,804,094
Idle in U. S. Treasury.....	69,741,883
Total coinage.....	\$258,545,977
The amount of idle dollars was decreased	\$6,600,000 in March.

THE destruction of the Nevada Queen hoisting works by a powder explosion will be a sad blow to the business interests of Tuscarora, Nev., for a few months.

CHINESE are swarming into the placer diggings near Unionville, Humboldt county, Nev.

Passing Events.

Work will soon be commenced on the water-mill on the Comstock, and this is expected to bring brisk times in that region. The use of water-power for quartz-mills is coming into practice in many places on this coast, and wherever the system has been introduced economy in crushing ore has resulted.

Some of the Southern California mining camps are attracting greater attention just now, notably the Piru or Lexington, the Cargo Muchacho and the Julian districts.

California manufacturers are expecting much better times from the workings of the Interstate Commerce Act, though the representatives of certain interests are much opposed to the operations of the new law.

In this State the prospectors are again abroad, and in colder regions they will shortly come out of their winter quarters for summer's work.

Immigrants continue to come into California by the hundreds weekly. They are settling the State up rapidly. Lands to the south having greatly risen in value, many are now searching out the cheaper lands in the upper part of the State.

The resident miners of Gold Hill are again at work.

Finding Mines and Making Mines.

There appears in a recent issue of the New York *Financial and Mining Record* an editorial to the effect that "Mines are Made, not Found." In support of this position we are reminded how much skill, time and money are required to open, equip and bring a mine into a productive condition, and without the application of which it would not only be non-productive, but would have no existence. Now, while the above doctrine is in no case more than partially true, there are some in which it is wholly untenable, there being instances in which mines may be said to be found, and not made. As examples of this kind we have the earliest deposits discovered and worked on the Comstock lode; first at Gold Hill and a little later on the Ophir and the Mexican grounds at Virginia City, at both which localities the rich ore occurred on the very surface, at Gold Hill in croppings that stood many feet above the ground. All the miners had to do here was to break down the quartz with picks, after which it was taken on wheelbarrows and dumped into the arrastras, the machines first employed for working it.

The Eberhardt mine, in the White Pine district, one of the richest bonanzas ever discovered, was a find, pure and simple. So, also, was the Sheba mine in Star canyon, Humboldt county, Nev., which contained an ore body very similar to that in the Eberhardt mine. In the same category may be placed the "Razor Blads" veins at Auetin, in the Reese river country, where the rich ore occurred in the very apex of the veins and went down several hundred feet with but little interruption.

If tradition may be credited, a goat-herd, pursuing one of his flock up a steep mountain in South America, laid hold of a shrub, which, giving way, revealed a mass of silver ore so rich that the discoverer, a peon, accumulated a large fortune packing it off and working it in a clandestine manner. This deposit, which proved afterward one of the historic mines of this world, furnishes another example of a mine found already made!

But there is some force in the *Record's* postulate, after all. Human agency has, even in the few instances mentioned, a good deal to do with the creation of a mine—at least of a profitably productive mining property. Nature must, of course, furnish the ore, depositing it under conditions more or less favorable. This done, her agency ceases. She might, it is true, have done a good deal more—might have deposited the pure metal and even coined it into money of convenient denominations. Having failed in this, it becomes necessary for man to supplement her work; hunting after and finding first the ores, then digging them out and extracting from them the precious metals, to be afterward coined into money, converted into jewelry or otherwise disposed of, as interest or fancy may dictate.

The finding of a mine already made is a bit of good luck of such rare occurrence that it must not be depended upon by those who purpose embarking in the business of practical mining. They must make their calculations on a different basis—calculate that they will have to deal with ore bodies as they generally occur in nature; large, small, rich, poor, medium, free, and base; calculate that while some can be easily reached, others again can be reached only under great difficulties. Such being the conditions under which mining for the precious metals has to be carried on, they who would conquer success must be prepared to conform to them, inasmuch as success in this business depends almost wholly on skill, prudence, and well-directed effort—so much so that it may be conceded that our New York contemporary is more than half right in saying "Mines are Made, not Found!"

The river mining companies in the Honolulu district, Klamath river, are getting their claims in order for successful work, two or three companies having already commenced hoisting gravel. The others will shortly have their windmills and wheels completed to start hoisting also.

The hoisting works of the Nevada Queen mine, recently destroyed by an explosion, will be rebuilt as soon as lumber can be procured.

The Petaluma *Courier* reports a new discovery of coal on the ranch of Peter Malone, on the east side of Sonoma mountain.

California Mines on the New York Stock Board.

Listed on the New York Mining Stock Board appear the names of 50 California mines, half of which are there classed as dividend-paying and the other half as non-dividend-paying properties—that is, such as have never paid any dividends at all. It is not to be understood that the so-called dividend-paying mines are all paying dividends at present, for, of the entire number so designated, only five are now actually doing so, the others having paid no dividends for periods ranging from two to six years. The mines here represented as paying dividends at this time are the Plymouth Consolidated, the Sierra Buttes, the Derbec and the Mount Pleasant; the Idaho, at Grase Valley, which has paid monthly dividends regularly for the past ten years, being, by a singular blunder, set down in this catalogue as having been delinquent in this respect for the past two and a half years.

Even after restoring the Idaho to its proper standing, the exhibit is by no means a flattering one—only five mines out of 50 making more than enough to pay their way is not much to brag about! Procuring a mine to be listed on the New York Stock Board is not, however, a true gauge of its merits. A good many of those so listed possess, in fact, no merit whatever, several of these California mines belonging to that class of properties. So far from having made any net earnings, some of these mines have made no earnings at all. But this does not imply that the companies representing them have been without revenues, the assessment machine having, in most of these cases, been vigorously worked, even though little or no work has been done on the mines themselves. A sorry showing indeed would this mining industry of California make, judged by its record in this New York institution! which includes not more than four or five of our first-class mines and scarcely more than a score that are here recognized as being entitled to rank even in the second class, the balance being properties of still lower grade, some of them sheer wildcats!

But the dividend-paying mines listed on the Stock Boards, whether of New York or elsewhere, constitute but a small proportion of the paying mines in this State, a majority of which are owned and worked by small non-incorporated companies or by incorporated companies who have nothing to do with stock operations, and never make any public display of their earnings. We have some 30,000 men employed in the mines of California, earning good wages or making improvements on their properties, few of whom either know or care what mines are listed on the New York or the San Francisco Stock Boards, this being a matter that does not interest them.

The Late William Ashburner.

Prof. Wm. Ashburner, a well-known man on this coast, died at his residence in this city on Tuesday. He was formerly on the State Geological Survey, with Prof. Whitney, and has long been identified with mining interests. He was a mining engineer by profession, though of late years he has done little in this direction. He was Honorary Professor of Mining at the State University, and one of the Regents of the institution. Prof. Ashburner was also a trustee of the Leland Stanford Jr. University. For several years he was president of the Board of Trustees of the California Academy of Sciences, and has served one or two terms as president of the San Francisco Microscopical Society. Prof. Ashburner was also a member of the Historical Society, the Technical Society of the Pacific Coast and the Geographical Society.

The deceased took a very active interest in the affairs of the State University, and he will be greatly missed in the Board of Regents. He was a man held in high esteem for his talents and his social qualities. He was quite active in all of the societies with which he became associated. Of a genial disposition, he made many friends in all directions, and his loss is deeply regretted by a large circle.

The Placerville *Democrat* states that mining men of means are examining into the scheme to tunnel through the mineral belt to the east of Big canyon, and that there is a likelihood of the project being pushed forward at an early date.

Academy of Sciences.

President H. W. Harkness was in the chair at the last meeting of the California Academy of Sciences. Dr. Carl Von Hoffman was elected a member, and Adley D. Cummins and George J. Specht were nominated for membership.

The following contributions to the cabinet were received: Sixteen specimens of copper ores, country rock, etc., from J. R. Souham. Specimens of lava from Mauna Loa, from F. L. Clark. Specimens of fossil leaves from Elsinore, San Diego county, from J. D. Hoff. Vertebræ from fossil skeleton found near San Aido, on Salinas river.

Captain F. L. Clark, of the Hawaiian islands, delivered an instructive address on the Hawaiian volcanoes. He presented to the Academy the first of a series of maps he is making by direction of the King. It is of the south part of the island of Hawaii, showing the position of the crater of Moku-a-wro-wro, on the summit of Mauna Loa, nearly 14,000 feet high. The active volcano of Kilauea is shown on the eastern slopes, with the recent flow of lava from near the summit to the seashore, near the south point of the island. Captain Clark gave many interesting details connected with his subject.

Dr. George Hewetson read Part I of a paper "On Sponges." This paper was illustrated by photo-micrograph stereoscopic views projected on a screen by Dr. E. S. Clark.

Dr. H. H. Behr read a brief memorial of the late Dr. Albert Kellogg, and on motion the following preamble and resolutions were read and adopted:

WHEREAS, Our co-worker in the field of science, Dr. Albert Kellogg, whose amiable qualities of head and heart won the friendship of all who knew him, has, by that divine and inscrutable Providence which governs all things, been removed from his late sphere of action and consigned to his last resting-place of mortal man; he it

Resolved, That it is with sincere regret that the officers and members of this Academy of Sciences have received the announcement of his death, and we do hereby desire to express our sympathy with the relatives and friends of the deceased.

Resolved, That this memorial paper and these resolutions of condolence and respect be spread in full upon the minutes of the Academy.

President Harkness announced the death of Dr. F. H. Jensen, a resident member of the Academy. He called upon Dr. Behr, who gave a brief sketch of his friend's life. Dr. Jensen was born in Germany in 1847 and died in San Francisco last week of consumption. He was educated as a chemist and took a high rank in the University. His specialty was the preparation and use of explosive compounds, and he was employed for some years in the great tunnel of St. Gothard. In 1880 he went to Peru for his health and thence came to California as chemist for the Giant Powder Company. By his death at the early age of 40, the scientific world has lost a devoted student and the Academy a worthy member. Dr. Jensen was also a member of the Technical Society of the Pacific Coast.

Mining Accidents.

On Monday last Terrence Smith was crushed to death at the Mabel Drift mine, North Bloomfield, by a boulder falling on him. Deceased was an old resident at Moore's flat, and leaves a wife and five children.

Thomas Harris was killed by a mass of coal falling on him, on Tuesday last, in the Vancouver Coal Co.'s mine at Nanaimo.

George Pasent was hurt at his drift claim at Tippecanoe, Sierra county, last week. He was working with a self-acting ground-sluicing apparatus; the gate getting out of order, he got down in front of it to fix it with a crowbar, when the gate suddenly raised, the water caught him and carried him over a fall of 12 feet and a long way down the ravine, where he caught on a piece of timber projecting into the stream, and was helped out by the man who was working with him. He was badly bruised, but his injuries are not dangerous.

The Grand Parlor of the Native Sons of the Golden West has been in session at Nevada City, this week, the guest of Hydraulic Parlor. They visited the Manzanita hydraulic mine. It was expected some time ago that arrangements would be made for putting up a monitor and running water through it for half an hour, so as to show those of the visitors who had never seen hydraulic mining what it looked like. Although no injury whatever would have happened from this short exhibition, the Anti-Debris Association caused a notice to be given forbidding turning on of the water.

New Smoke-Consuming Furnace.

Charles C. Carter, of this city, has just received a patent, through the MINING AND SCIENTIFIC PRESS Patent Agency, for a smoke-consuming furnace of that class in which a suction-fan or blower is connected with the smokestack and with the fire-chamber, whereby the smoke and other products of combustion are drawn from the stack and forced through the furnace again. Mr. Carter's invention consists in a conical or inverted funnel-shaped hood located within the smokestack and having a diameter a little less than that of the stack, a second hood located within and concentric to the first hood, and of a diameter enough smaller than the outer hood to leave an annular space between the two; a pipe or passage through the apices of both hoods and communicating with the annular space between them and the pipe from the suction-blower; a damper controlling the pipe or passage below its communication with the annular space between the hoods, and a damper controlling it above its communication with the suction-blower pipe.

In smoke-consuming furnaces of this class it has generally been the custom to stop the suction-pipe from the fan-blower at the inner surface of the stack. The disadvantage of this has led to an improvement, by placing within the stack a conical or inverted funnel-shaped mouthpiece or hood which communicates at its apex with the pipe from the fan-blower, and it is also provided with apertures or ports in its sides, which are controlled by gates operated from without, whereby, when said gates are open and the fan communication closed, the natural draft may take place uninterfered with; and, after this draft has become sufficiently strong and has served its purpose in firing up, then by closing the gates the smoke and products of combustion are confined to the mouthpiece and are drawn up by the fan and discharged into the furnace again.

Experience has shown Mr. Carter the disadvantage of this form of consumer. The funnel-shaped mouthpiece has a diameter a little smaller than the stack, and therefore there is left an annular space around its rim and between it and the inner surface of the stack, through which a portion of the products of combustion passes by the natural draft. It has not been deemed best to close this point of natural draft, as a certain amount is found necessary; and when the damper closing the main natural draft is closed, the smoke and products of combustion have either to find an escape through this annular space between the hose of the mouthpiece and the

stack, or to pass into the body of the mouthpiece and thence into the pipe connecting with the suction-fan. The suction, while very strong in the upper end of the mouthpiece, is very weak at its base, because at that plane the area of the mouthpiece is so great that the force of the suction by distribution is diminished. Therefore, while it is true that a great portion of the smoke and products of combustion passes up into the mouthpiece, a large portion also escapes by the annular passage between the rim of the mouthpiece and the interior surface of the stack.

The object of Mr. Carter's invention is to overcome this difficulty by applying the suction where its power may be employed to a greater advantage and less of the smoke and

products of combustion allowed to escape, almost all being drawn in by the suction. This is accomplished by transferring the point of suction from the apex of the funnel-shaped mouthpiece to the base of the hoods.

Richards' Patent Hydraulic Machinery.

NUMBER 4.

These machines, on which a patent is now pending, are a departure from the usual method of draining overflowed lands.

As may be seen, they are of very simple construction and less than one-half the size and

Fig. 7.—RICHARDS' SIPHON DRAINING MACHINE.

cost of centrifugal pumps of similar capacity. They besides require no foundations, being held by the pipes as shown in the drawing. The shafts stand across embankments in position to be conveniently driven by portable engines, so that permanent steam-power is not required

process of construction. The cars are running regularly every half hour, and more frequent service will be put on as business increases. On Sunday we run four cars, and carry during the afternoon about 1500 passengers a distance of three miles with perfect ease. Our usual speed

The Los Angeles Electric Railroad.

We have received from C. H. Howland photographs showing the cars, etc., of the Los Angeles electric railroad, from which we have made the engraving which appears on this page. Mr. Howland, who is manager of the Los Angeles Electric Railway Co., sends us the following description of the road:

"This is the first electric road constructed on the Pacific Coast, and the most complete and successfully running road in America.

"It is at present completed and in regular service for three miles. Two miles more are in

improvements over the Baltimore plant.

"Our road has but few grades, and one short one about 150 feet per mile. At Baltimore the grades are 353 feet per mile. At Pittsburgh the same company is putting in a road with grades 750 feet per mile.

"Los Angeles has been the pioneer for electric lighting, and now steps ahead of any city on the Pacific Coast in electric railways. Should San Francisco enterprising desire to introduce electric railways, all necessary information can be obtained at Los Angeles."

Steam Pumps in Mines.

By the bursting of a steam pipe recently, in the Pennsylvania Coal Company's No. 2 shaft, at Nanticoke, Pa., a large number of men were suffocated. The accident happened on Sunday, when the colliery was not being worked, and no men were below. The fact that the men were suffocated in a few minutes

proves that the men employed in the vicinity of the bottom of the shaft would have shared the same fate if the accident had occurred on a working day. Those in less ventilated portions of the mine would also have been in a dangerous position. In pumping from these deep workings, where heavy volumes of water are raised, a great deal of steam is used,

and on the bursting of a pipe, a great volume of steam can escape before means can be adopted to stop the flow. Passing into confined workings, this steam would be most dangerous. In fact, this is considered by Pennsylvania coal journals as a new element of danger added to the already hazardous occupation of mining for coal. Such accidents do not often happen, but the liability is something to be considered.

The *Mining Herald and Colliery Engineer*, in speaking of this accident, says: The employees of more than half the collieries in the anthracite coal regions are exposed to just such danger. At the bottom of nearly every shaft or slope there is one or more large steam pumps, propelled by steam, and the sudden bursting of a steam pipe, as in the case of the Nanticoke accident, must endanger the lives of every person employed in the mine. The steam pump is a necessity, or at least has come to be regarded as such, and until something better suited to the work of draining mines is invented, will continue to be used. The only means, therefore, providing for the safety of the men employed in the mines against such accidents as this, is by the use of downcast instead of upcast fans. If the main opening of the mine be an upcast and an accident of this kind should

ELECTRIC ENGINE AND TRAIN ON LOS ANGELES ELECTRIC RAILROAD.

except for the larger sizes. There is no limit to size or capacity unless the work is to be done by portable engines, in which case it can be subdivided by using several machines as one plant, or on one tract of land. The smallest size in contemplation is 12 inches, capable of discharging 4000 to 5000 gallons a minute. Arrangements are now being made for testing the economy and efficiency of these machines, after which they will be erected under proper guarantee of successful performance. The water-driving details of the machine will not be described here, but will be given with suitable drawings at some future time.

FROM BUTTE, M. T., the hullion shipments last week were \$191,328.

is from 10 to 12 miles per hour; sometimes 15 miles per hour; can run 20 miles per hour.

"We use at present a 30-horse power engine at the station generating the electricity, which is conveyed by overhead wires to any portion of the line, and connected with the motor on the cars by a trolley running overhead.

"The cars used are provided with seats for 35 passengers. We have had them crowded with as many as 97 passengers.

"The road can be constructed at one-third to one-quarter expense of a cable road, including equipment, and can be run at greater speed and at less expense. The system invites the most rigid examination.

"The system used here is the Daft system, the same as that used at Baltimore, but with many

occur, the steam would be forced up the shaft or slope, and would be prevented by the air currents from finding its way into the distant workings. This would reduce the danger in case of such accidents to a minimum, but with upcast fans and a volume of air to carry the steam in upon the men at work in the distant recesses of the mine, the danger to be feared from such accidents is really appalling.

THE *Territorial Enterprise* says: At this season of the year there is a vast deal more water flowing down all the rivers of Nevada than can be utilized by the mills or on the ranches. What is wanted is reservoirs in which to catch up the water that is now running away.

MECHANICAL PROGRESS.

A New Steel for American Safe Manufacturers.

The English correspondent of the *American Manufacturer* says that a new steel possessing peculiar properties, which, it is thought, will recommend it to the safe and strong-room manufacturers of the United States, is now being manufactured by the New British Iron Co., Congreaves Works, near Birmingham, England. He has inspected samples of the new metal, whose nature consists of a very soft exterior and a very hard interior. This is not accomplished by the welding of two steel plates in juxtaposition, as is frequently done with regard to steel and iron composite plates, but the metal is rolled all at once. The difference in structure is not observable as the metal leaves the works for the address of the consumer; it is not until the consumer has himself manipulated it that the change which constitutes its value occurs.

The Merits of the New Steel.

The steel all through is at first sufficiently soft to allow of the operation upon it of all the necessary fitting and drilling occurring in the building up of safes or strong-rooms, and the instructions to the user are that, after fitting and drilling have been performed, the metal should be reheated red hot and plunged into water, when the interior section becomes so hard as to be perfectly drill-proof, while no change occurs in the nature of the outside section, so that being soft it will resist the burglars' sledge successfully. Rivets are made of the same material in the same way for riveting together the various parts of the structure.

Price of the New Material.

The prices of the new material in plate or bar form is \$80 f. o. b. Liverpool, which price compares very favorably with the figure, something like \$125 per ton, which has hitherto had to be paid for Sheffield steel of a similar nature.

Already samples of the new material have found their way to some 54 of the leading safe manufacturers in your country, and expressions of opinion have been invited upon them. The result has been wholly favorable, and such as to lead the manufacturers to believe that a profitable market can be found upon your side. One or two firms remarked that by the operation of the blow-pipe the temper of the interior of the steel could be taken out, but it is hardly to be supposed that burglars would provide themselves with special appliances of this description.

A New Material—Vulcabeston.

This is the name of a new article, intended to combine all the valuable qualities of asbestos and India rubber, of which, as its name indicates, it is mainly composed, although other vulcanizable materials enter into its composition. It forms a substance of the toughness of horn, although it can be made of any degree of flexibility; it is a non-conductor of electricity, and stands the severest test of acids, steam, gases, etc. From its quality of permanently resisting heat, which has been so long known as the characteristic feature of asbestos, it has been adopted by the United States Government for use around steam engines.

One of the most important uses of the new article is as a molded piston-rod packing ring, made to fit any sized rod or stuffing-box, and to be sprung in place with a slight pressure, one or more rings being used as desired, and forming a perfectly tight seam joint. These rings do not wear the rod as do metal rings, and they are self-lubricating. The first set made of these rings has, it is said, been in use over 11 months, in a Hartford, Conn., manufactory, on an engine run at 280 strokes per minute, and is still in perfect order, and said to be in as good condition as when first put in.

Vulcanized asbestos piston-rod packing, in the form of flexible rope, of all sizes, will not shrink or blow out, and is especially adapted for use on locomotives and ocean steamers, and in other places where loss of time in repacking is of the greatest consequence, and when the use of ordinary steam packings would, consequently, be entirely inadmissible. In consequence of its great strength and durability, it can be used wherever metallic packings have heretofore been necessary.

The new vulcabeston is made into sheet packing, hard, medium and soft, in sheets or rolls, in all sizes of round and oval gaskets, and in hard and medium-molded piston-rod packing rings of all the regular sizes, any special forms being readily made to order. The vulcabeston can, if desired, be made of any color, and is thus well fitted for a variety of ornamental work and other special uses. This material is manufactured by the H. W. Jobne Manufacturing Co. of New York.

USING OIL IN BOILERS.—The *Manufacturers' Gazette*, of Boston, recently published several articles on the use of oil in boilers. The editor, who is a practical man and one who has had considerable experience in the matter, says he believes "in a limited amount of oil, and that is crude petroleum, first, last, always and only. The quantity to be used is very, very small. We would take in every instance a boiler which had a slight amount of scale upon it, release every particle of this scale or sediment,

blow it out, and keep it out, and we are sure that our readers will profit by following the direction which have been given so many times, with increased safety to themselves and an advantage in economy, and we believe it is just as applicable to a cast-iron as a wrought-iron boiler, although we have not positively proved that such is the case from any actual experiment or test." The *Scientific American* says on this subject: "The proper way to use the crude oil is to send it into the boiler through the feedwater, only once a day, and only in very small quantities. One-half an ounce per day will keep an ordinary tubular boiler of 50-horse power as clean as possible; and after a few months of regular use the shell will be found as smooth as a piece of japanned work, provided it was not pitted at the start, and the tubes will be perfectly clean and smooth. The oil must be introduced into hot water, and for some reason it does its work better under pressure. If any 'constant feeding' of the oil into a boiler takes place, the fire seems will commence to leak, for this has been tried; there seems to be a call for only a small amount of the oil, and the small amount must not be exceeded."

ALUMINIUM STEEL.—Messrs. S. French and B. M. Plumb, of 36 Lombard street, E. C., London, the European agents of the Cowles Electric Smelting and Aluminium Company of Cleveland, Ohio, are showing two interesting samples to illustrate the beneficial effects of the addition of small quantities of aluminium to steel. Each specimen consists of a bar of iron, and a bar of Siemens-Martin basic steel welded side by side and broken off. In one specimen, however, the steel contains one-fifth of one per cent of aluminium, while in the other the metal is of the ordinary quality. In this latter case the position of the weld is clearly visible, there being a clear line between the crystalline structure of the iron and the fine grain of the steel. But in the former sample no such line is to be seen, and the characteristic of the steel appear to extend far into the iron, rendering it impossible to tell by the appearance where one ends and the other begins. The same firm has also a forged bar of aluminium bronze, containing five per cent of aluminium, which has broken in this testing machine at a strain of 36 tons per square inch of original section, and with 60 per cent elongation. A bar of this metal forged, bent, and broken in company with a similar bar of Siemens-Martin basic steel, exhibited characteristics identical in every respect except color.

THE INTELLIGENT MECHANIC'S LABOR.—A group of gentlemen were discussing the necessity of brain labor in some life vocations, and after allusions had been made to several well-known citizens who were successful and prominent in their professions, one of the speakers, himself a retired merchant and influential politician, declared that Blank, naming a draftsman and inventor employed in a large machine tool manufactory, did more brain labor than any other man in the city. Some examples were cited of well-known mechanics, and the conclusion was reached that intelligent mechanical labor required as much solid thinking as any other way. The intelligent, valuable mechanic is not a mere walking machine; materials are not always plastic; they are sometimes perverse, and judgment and calm consideration are required in their management. The parts of a machine, however closely planned, do not come together unaided and naturally, as eye-stones converge in a caucor of vinegar; it requires head work to "assemble" the parts of a machine of any kind, and nowadays when mechanical work requires an accuracy of proportions and a nicety of dimensions such as were not dreamed of a generation ago, the mechanic who is not brainy in his line will surely get left.—*Ex.*

RAPID WORK.—Some idea of the extent to which mechanical ingenuity and efficiency have advanced may be had from the following statement: "It is now possible to construct a complete sewing machine in a minute, or 60 in one hour; a reaper every 15 minutes, or less; 300 watches in a day, complete in all their appointments. More important than this, even, is the fact that it is possible to construct a locomotive in a day. From the plans of the draughtsman to the execution of them by the workmen, every wheel, lever, valve and rod may be constructed from the metals to the engine intact. Every rivet may be driven in the boiler, every tube in the tube sheets, and from the smoke-stack to the ash-pan, a locomotive may be turned out in a working day, completely equipped, ready to do the work of 100 horses." Without such machinery and the skilled labor to operate them, the civilized world of to-day would be an impossibility.—*Ex.*

GRATE BARS UNDER A BOILER.—In placing grate bars under a boiler, the usual practice, when using coal, is to place the bars from 22 to 24 inches below the boiler to get the best results. In large wood-working shops, when shavings, etc., are used, the distance is usually about 28 inches. Grate bars should be about three inches lower at bridge-wall than at fire-door. Bridge-wall should be built up to within eight inches of the boiler, and have from one-sixth to one-eighth the area of the grate. The best plan for burning sawdust (in large quantities) is to have the furnace extend further forward than the boiler, and have a feed "well-hole," through which to introduce the sawdust, above the regular "stoking" door.

SCIENTIFIC PROGRESS.

Sea Telephony.

A report from Fort Myers, Florida, where Mr. Edison is sojourning, says that he is working on his sea telephony. The inventor says that already he can transmit sound between two vessels from three to four miles distant, the one from the other, and he seems confident, now the principle is established, that he will be able to increase this distance between his stations as the apparatus becomes more perfect.

The Florida waters are peculiarly favorable for experiments of this nature, because of the absence of steamers upon them, or other disturbing sounds on the adjacent shores—resembling in their quiet repose the waters of the open sea, where the invention he is striving to perfect will find its most important application.

Up to the present time, Mr. Edison has not succeeded in transmitting articulate speech through his sea telephones, nor is this essential to the success of the system. By means of submarine explosions, he is enabled to form a series of short and long sounds in sequence, and by these, as in the Morse system of telegraphy, words and sentences can readily be transmitted.

In the original experiments in this direction, made by Prof. Trowbridge, and from which these have sprung, two vessels, each furnished with an electric generator and a steam engine, were anchored a mile or two apart in quiet waters. Wires charged with the current were hung over their sides into the water, the upper ends being connected with the telephonic transmitter and receptor. It was sought to send articulate speech between them, and when the two were quite near together, this, it is said, was readily accomplished. Later, however, this seems to have been regarded as impracticable, and the system, now experimented upon by Mr. Edison, of transmitting short and long sounds, was adopted, and, up to a certain point, gave no little promise.

The distance which separates the purely scientific from the practical success is so wide, however, and the way is so beset with obstacles, that it is no easy matter to find, or if found to keep, the right road, and so it was that these first experiments, valuable as they were, soon ended, and it remains for the practical man, the experimenter rather than the student, to take up the problem and push it on to a solution. Edison is peculiarly fitted and equipped for this work. When in good health, he is a close and constant observer, tireless and original. If he succeeds in finding a practical and reliable means of transmitting any kind of intelligible signal through the water between two vessels several miles apart, a principal cause of disaster on the ocean will have been removed. Though many ingenious and admirable contrivances have been thought out of late years to lessen the dangers of ocean travel, nothing has been done to prevent collisions in thick or foggy weather, which may fairly be said to be the most menacing of all.

Were the sea-telephone perfected, however, collision in thick weather could readily be averted. Vessels would keep their telephone warning going, as well as their whistles, and, while the latter only sounded a general alarm, the telephone would give the exact compass course of the direction whence each ship was advancing, and this, too, in time to prevent a meeting.—*Scientific American.*

OXYGEN IN VITAL PHENOMENA.—Some interesting information is given by Dr. B. W. Richardson, respecting the influence, under varying conditions, of oxygen in vital phenomena. It was obtained by inclosing mice in glass chambers containing atmospheres in which the proportion of oxygen varied with the experiment, and observing the time that elapsed before the animals became narcotized at different temperatures. It was found that at a temperature of 55° F., when oxygen and nitrogen were present in the proportion of one and four (i. e., common air), the animal became narcotized, and died asleep, in one hour and 50 minutes. In two parts of oxygen and three of nitrogen, as well as in three of oxygen and two of nitrogen, the animal remained free from narcotism 30 minutes longer, but eventually became rapidly narcotized and died within two minutes of the same time. But with four volumes of oxygen and one of nitrogen, narcotism did not occur for two hours, and then lasted six hours before death took place, while with pure oxygen, narcotism was also deferred for two hours, but only lasted four hours. When the temperature was lowered to 20° F., the effect was to reduce the vital combining power to such an extent that oxygen became practically an anesthetic gas; in pure oxygen the animal was narcotized in a few minutes and died in half an hour, while in common air the animal remained longer awake, but died in 45 minutes. When temperature was raised to 70° and 90° F., pure oxygen sustained life longer than common air in equal volume, but at 125° F. coma and death took place in 15 minutes.

THE MEDICAL POSSIBILITIES OF PHOTOGRAPHY.—The *Evening Post* says: "In the *Camera* magazine a very curious phenomenon, in connection with photography, is recorded by the person who observed it. He took a portrait of a child apparently in full health and with a clear skin. The negative showed the face to be

covered with an eruption. Three days afterward the child was covered with spots due to prickly heat. 'The camera had seen and photographed the eruption three days before it was visible to the eye.' Another case of a somewhat similar kind is also recorded, where a child showed spots on his face a fortnight previous to an attack of smallpox. It is suggested that these cases might point to a new method of medical diagnosis."

SINGULAR AND INTERESTING EXPERIMENT.—In an experiment recently made before the Society of Chemical Industry, in England, one of the members is reported to have proved not only the possibility of a flameless combustion of gas, but also to have practically demonstrated the enormously high temperature capable of being obtained by such flameless combustion. Taking a hall of iron wire, about three pounds in weight, he placed it on a slip of fire-clay, and directing a blow-pipe on it for a few seconds, suddenly blew the flame out; the temperature increased so rapidly that in a few seconds the wire began to fuse and run into drops, and this temperature was steadily maintained. The room was darkened, but the closest examination did not show a trace of flame, though the fact that the gas was being consumed was proven by repeatedly relighting and extinguishing it. This same experiment was repeated in another form by directing the flameless heat into a small fire-clay chamber in which a refractory clay crucible, made especially for nickel-melting, was partially fused and worked into a ball like soft putty—the sides of the fire-clay chamber being at the same time fused. The heat was so great that the blow-pipe laboratory was much too hot for comfort, even during the evening succeeding the experiment.

MORE INSTANTANEOUS PHOTOGRAPHY.—Mr. Mallin, a photographic artist, of Southampton, England, has recently been very successful in taking instantaneous photographs of flying gulls. Animals in far more rapid movement have been photographed by Mr. Muybridge, in America, or M. Marsy, in France; but these are produced by special apparatus, and rarely give much more than a silhouette of the object photographed. The photographs of the gulls were taken by Mr. Mallin under ordinary conditions and with ordinary apparatus; but the lens must have been a good one, and a very rapid shutter must have been employed. The plate also must have been of special high sensitivity. About 60 birds are shown quite sharply and distinctly, and their various attitudes are curious. Most of them have the wings spread in the orthodox manner, but some of them are caught in the position with the wings hanging down, which, from the shortness of the time during which it is maintained, the eye does not appear to catch. The photographs are striking examples of the speed with which objects can now be thus reproduced.

THE PRINCIPLE OF INERTIA.—In treatises upon physics and mechanics, inertia is defined as that property of matter which prevents it from putting itself in motion when it is at rest, or from bringing itself to a state of rest when it is in motion. It is by virtue of the principle of inertia that dust is expelled from our clothes when they are beaten, every particle of it tending to a state of rest. Although we have cited numerous experiments on the principle of inertia, we shall mention another one which has been pointed out to us by Mr. H. Gilly, licentiate of sciences: Upon the forefinger of your left hand, held vertically, lay a visiting card, and upon this place a silver dollar and try to remove the card without touching the coin. In order to do this, give the card a smart flip with the fingers of the right hand and it will fly to a distance, leaving the coin balanced upon the forefinger. Care must be taken to give the flip in an exactly horizontal direction and in the plane of the card.—*La Nature.*

A VALUABLE INVENTION.—A peculiarly constructed microphone is now being used in Germany for the purpose of detecting loss of water through leakage in town mains. The apparatus consists of a steel rod, which is placed upon the cock in the neighborhood of which the leak is suspected, and a microphone attached to the upper end of the rod. A dry battery and a telephone complete the equipment. No sound is heard in the telephone if the cocks are closed and no leak occurs; but a leak even of a few drops through a badly fitting cock causes sufficient vibration in the pipe to affect the microphone and give audible sounds in the telephone. At a recent meeting of gas and water engineers, in Eisenach, it is stated that the apparatus is so simple to handle that, with a little practice, ordinary workmen are able to detect and localize any leak.

SUNLIGHT ON VITALITY.—M. Duclaux has studied the influence of sunlight on the vitality of micrococci. A few hours' exposure to the sunlight weakened the pathogenic micrococci, and finally killed them. The inference is, that sunlight is a universal hygienic agent, one that is most active and powerful, common to both private and public sanitation.

NATURALLY BLIND CREATURES.—There are 172 specimens of blind creatures known to science, including crayfish, myriapoda, etc. They are mostly white, whether from lack of stimulus of the light, or from bleaching out of the skin. Some species have small eyes and some none.

ENGINEERING NOTES.

Tests of Wood for Building.

The recent numerous accidents from the breaking down of wooden bridges, and the less frequent ones of the giving way of floors and buildings, give a peculiar significance, at this time, to the following extracts from an article in a late number of the *Age of Steel*, by J. B. Johnson, Director of the U. S. Testing Laboratory at Washington University:

If one is ignorant of the character and strength of his material, he is as badly off as if he knew not the stresses to which it was to be subjected. What shall we say, then, of those builders and designers who know neither the one nor the other? There are few more astounding facts than this, that a large proportion of the structures which are daily erected, to the safety of which we trust our lives, are little better than blind guesses as to their ability to stand the loads to come upon them. Usually, however, the guesser—that is to say, the designer—tries to be sure and guess large enough; but he occasionally guesses too little, and not unfrequently guesses so large as to make the cost unnecessarily great. Custom is made to determine the dimensions of the structure and the character of the joints, whether for a warehouse, an elevator or a dwelling; a machine, a vehicle or an engine.

Manufacturers, builders, architects and too many engineers rely solely on the tables and formulae given in the trade or engineering handbooks. They know nothing of the original experiments from which the tables are derived, and too often are unable even to verify the truth of the formulae. As a matter of fact, the portions of these books referring to the strength of materials, and especially of wood, were based on experiments on small specimens and were made about 100 years ago! Some of the arguments in favor of a new test are given below:

All the old tests were made in England, and, as already remarked, on small specimens. The Western American woods have never been fairly tested for strength. Such tests as have been made on large specimens of American wood have shown the strength to be only about one-half what all the tables give them. Many cheaper kinds of timber may prove more valuable for structures than more expensive varieties, which have been supposed to be stronger.

Thus pine supports or pillars have been found stronger than oak ones, when tested in full-sized samples. Notches cut in beams or joists, whether at the ends or in the middle, have been found to weaken the pieces a great deal more than is generally supposed. When a joint is notched into a floor beam or header, it is only about one-half or one-fourth as strong as when left full size and resting on the bottom. It always splits from the notch. If the portion below the notch be sloped off so as to come to the full depth at the middle, the strength is doubled. That is to say, by removing a portion of the joint (in case of a notch), the strength is increased. This seems paradoxical, but it is true in practice and consistent with theory. It then does not fail by splitting from the end, but by breaking apart in the middle. The shearing or splitting strength of timber is of great importance in struts, and is almost always overestimated. A few well-arranged tests will give more information to the designer than all the tables in the handbooks on these matters.

CAPT. EADS AND THE PANAMA CANAL.—Whatever may be the effect of the death of the dauntless inventor, Captain Eads, on the future of the proposed interoceanic ship canal, that great competing enterprise, the Panama canal, now gives promise of successful completion. The indomitable de Lesseps declares that his mind is perfectly at ease in regard to the progress of the work, and that in three years the Panama canal will be opened for navigation, without a lock to intercept the free passage of vessels from one ocean to the other. The work of cutting through the rocks is being pushed with great vigor by the contractors, and the use of electric lights will soon enable them to turn night into day and work a double force, making it possible to do six years' work in three. Although the cost of this enterprise will be prodigious, greatly exceeding early estimates, and although obstacles in the form of disease among workmen and discontent among stockholders have tended to discourage the enterprise, the venerable de Lesseps does not seem to have lost heart for a moment, and it now looks as if the old man might live to see the completion of this, one of the greatest engineering achievements of the age.

A USEFUL AND APPROPRIATE MONUMENT.—Engineer Symons, U. S. A., has prepared plans and specifications for a memorial bridge across the Potomac, at Washington, in honor of General Grant. The center length of the bridge as designed is 4650 feet, 1339 feet less than that of the Brooklyn bridge. The central span is 160 feet wide in the clear, the main arches span 240 feet, and the smaller arches span 120 feet. The carriageway is 40 feet wide, and the two sidewalks 10 feet each, making the total width of the bridge 60 feet. The cost is estimated at \$10,000,000.

It has been discovered that a few hundred dollars' worth of gold specimens have been stolen from the State mineral cabinet at Sacramento.

GOOD HEALTH.

The Cancer Disposition.

We this week publish a letter received from Col. F. A. Bee, Chinese Consul of this city. Mr. Barton, the writer of the letter appearing in last week's issue, desires us to state that he will be most willing to give any information in his power to those who may so desire. We feel it our duty to thank those who have come forward, with freedom and graciousness, to give their testimony. Many others have promised to do likewise—assist as in our efforts to collate evidence. Mr. Barton's address is 2422 Buchanan St., S. F.

Sir: I have read with considerable interest the various communications in your journal relating to the query "Can cancer be cured?" I am prompted in this connection to give you a case that came under my observation directly in point. I had, in my employ in this consulate, a gentleman who, for over five years, acted as marshal and clerk. During three years he was afflicted with a sore, the size of a dollar, on his right hand, between his thumb and index finger. He used *ad libitum* every healing salve, ointment, plaster and poultice that he could hear of, but all to no purpose. Well-known physicians of this city prescribed remedies. Finally his fears that it was a cancer prompted him to consult two well-known surgeons. They made a diagnosis and informed him that it was a cancer, and a time was set to remove it with the knife. On informing me of this decision I requested him to permit me to have it examined by a practitioner who, I had been informed, had cured several cancer cases. He readily consented, and three weeks after he brought the cancer into my office preserved in alcohol. He remained in my service for over a year thereafter and there was not, nor has there been since, any signs of its return. If it was not a cancer then the medical gentleman prevaiated. Yours truly,

F. A. BEE.

The Effect of Strong Light Upon the Eye.

The exposure of the eye to intense light has been attended with many curious and unfortunate results. In the case of Prof. J. Plateau, of the University of Ghent, who, while trying to observe the effects of irritation of the retina gazed steadily at the sun for 20 seconds, a chronic irido-choroiditis developed, which ended eventually in total blindness. Dr. J. A. Andrews, in an article upon this subject, collects a number of cases in which choroiditis and retinitis occurred in persons who had observed an eclipse of the sun. The single flash of a sun reflector has been known to cause retinitis, and other temporary visual disturbances of a functional character have been frequently noted. M. Reich has described a curious epidemic of snow blindness which occurred among a body of laborers engaged in clearing a way through the masses of snow which obstructed the road between Passanaur and Meti, in the Caucasus. The rays of the sun, reflected from the vast stretches of snow on every side, produced an intense glare of light, which the unaccustomed eye could not support without the protection of dark glasses.

A few of the starkest among the laborers were able to work with impunity, but the majority suffered severely. Among 70 strongly marked cases, 30 were so severe that the men were absolutely unable to continue their work or to find their way home. They were collected in a covered place, where Reich found them on his arrival prone on their faces, striving to hide their eyes from the light, and crying out from pain. Recovery was gradual but complete.

W. C. Rockliffe records a case of acute conjunctivitis brought on by exposure of the eyes to a 3000 candle-power electric light. It is estimated that exposure of the naked eye for one minute to an arc light of 2000 candles will cause conjunctivitis. The violet or orange lights are said to be less injurious than the normal white light.

The light of lightning is too transient to cause any injury from simple retinal over-irritation; but it is known that cataracts sometimes follow lightning strokes, and these are believed to be produced by some physico-chemical influence.

Glassblowers suffer from an opacity of the lens, brought on, not by the light, but the intense radiant heat (145° F.) to which they are exposed during their work.

Of all forms of artificial illumination, the incandescent electric light, so far as facts now go, is the best. Among 1100 persons who worked by this light, Dr. Andrews found not a single case of injury. On the other hand, many persons testified to the fact that they could work longer by it with less fatigue than with the gas or oil light. This is due, it is found, to the steadiness, absence of heat, and perhaps the greater proportion of violet rays. Short-sighted persons are, in particular, benefited by the use of the incandescent lamp.—*Medical Record*.

TAKE SUFFICIENT DRINK.—Medical authorities now declare that it is of vital importance to health that the system should receive daily a sufficient quantity of water to amount to what sailors would call a "flushing"—that is, sufficient to wash away the waste. Most of

the matter which should be excreted is solid, and requires a comparatively large volume of fluid to dissolve it so that it may be cast off, an example of which may be seen in the case of uric acid, which needs several thousand times its weight in water to dissolve, or else it crystallizes in the shape of calculi, or produces other disease. Three and a half pints of water or other clear fluid, not obstructed by semi-solid contents, should be taken daily by every adult, and by large people as much as 4½ or 5 pints, in order to keep the cells of the kidneys well washed out, the effete waste matter from the possibility of depositing itself where it may do harm, and the system in health generally.—*Harper's Bazar*.

DISINFECTING FROM WHOOPING COUGH.—The following method of disinfection of sleeping and dwelling apartments and clothes is recommended by M. Mohn in the treatment of whooping cough. It is said to cure the cases immediately. The children are washed and clothed in clean articles of dress, and removed to another part of the town. The bedroom and sitting-room or nursery are then hermetically sealed; all the bedding, playthings, and other articles that cannot be washed are exposed freely in the room, in which sulphur is burnt in the proportion of 25 grammes to the cubic meter of a space. The room remains thus charged with sulphurous acid for five hours, and is then freely ventilated. The children return the same day, and may sleep and play in the disinfected room.—*Lancet*.

TO PREVENT PITTINO IN SMALL-POX.—Dr. A. S. Deane says that when he was physician to a large fever-hospital in Ireland, a young girl was admitted in the vesicular stage of semi-confined variola. He was experimenting at the time on the various methods proposed for preventing pitting. The plan adopted in this particular instance was to cover the face with a paste of whiting mixed with carbolic oil, while the patient's hands were confined in a sort of strait-jacket. The result was eminently satisfactory. No scar remained anywhere, except on the point of the chin, where the friction of the bed-clothes continually rubbed away the application.

EXERCISE.—It is gratifying to note that the masses of the American people are realizing the benefits of healthful exercise, and it is a great satisfaction for this generation to know that the result will be the production of a more perfect race of men, both intellectually and physically endowed with the glory of perfect manhood, a sound and vigorous mind in a healthy body.

USEFUL INFORMATION.

Cheapening and Adulterating Goods.

There are many spasmodic complaints of impure, adulterated, imperfect and unsound articles of production offered to purchasers and consumers, and remedies asked for. The sugar is adulterated with sand or glucose, the coffee and spices with various foreign cheaper substances, the woolen goods are part cotton, or hair or shoddy; the silk is weighted and stiffened with colors and jute and cotton, the iron is part cinder, or from poor ores; nails made from scrap and old rails, steel is anything but steel, our silver is platinum or zinc, or sterling or nickel; our gold is copper and zinc and tin and silver and lead; in short, the world is a deceit, a cheat, a humbug and a fraud.

But is this so? Is the world shoddy, padded, veneered and varnished? If so, why? What is the remedy? Is there no profit in genuine material, honest work and truthful results? But, again, we may ask, do not producers make what there is a market for? Does the world want the genuine, honest, pure and unadulterated, or does it want something "just as good"?

While America has all the protection necessary from the foreign cheap and nasty products, she ought to be able to produce the genuine. If our ports were open and free to the floods of imitation trash of the world there might be excuse for trick, deceit and fraud.

But where is the blame? Do the people want to pretend for what they are not, want to appear to live above or out of their honest spheres? Is it not the want of genuine, honest, healthful character on the part of the people which gives market to shoddy?

Suppose it is, but who can tell the difference? My diamond earring just as envy-engendering in paste and plate as my neighbor's in real. We eat and drink and sleep and wear as our inherent honesty of character compels, and a world absorbed in its own affairs takes little heed. If our own standard of manhood and womanhood is satisfied, justice us, then where the blame?

But is anybody deceived? Is it not a reflection upon the intelligence of the American people to say they are deceived or cheated? Are there any who will admit they are so ignorant? Do we buy two dollars' worth for 50 cents? Do we ever believe the representations of sellers? Do we ever believe our eyes, our ears or our noses regarding the purchase of two dollars for 50 cents? The world makes what there is a demand for. Cheap clothes, cheap food, imitation ornaments, cheap railways, cheap tools, cheap gas and cheap steam and electricity, and cheap diamonds—cheap people.—*Chicago Journal of Commerce*.

LIME JUICE AND OIL.—A large quantity of lime juice has been exported from Trinidad in recent years. The simple juice finds a market in America, and the condensed juice in England. A tree yields on an average about ten gallons of juice. The limes are allowed to drop off, and then passed first through the cutter, which rips them open, and next through rollers and a press to separate the juice. These cutters, rollers and press are constructed in a very primitive way, and admit of great improvement. The juice is then exported either as it is or condensed by boiling. A barrel of limes yields seven gallons of juice. The cost of producing lime juice, including packages, should not exceed 12 cents per gallon. The essential oil of limes is extracted from the rind before crushing by grating on rasps with the hands. The oil thus extracted is called band-made oil. A hundred gallons of juice will yield by distillation about three quarts of the essential oil.

CLEANING GAS CHANDELIERS.—The following hints are given in *Modern Light* for cleaning gas chandeliers: It is seldom that gas chandeliers are gilt; they are nearly always lacquered with yellow lacquer and burnished. But whether gilt or lacquered, they may be cleaned thus: Take the chandelier to pieces and boil the pieces for several minutes in a strong lye, then brush them over with a soft brush. Next pass them through a strong solution of cyanide of potassium, which is a deadly poison; then wash the pieces thoroughly in a large vessel of boiling water, dry them in clean sawdust, wipe them dry with a wash leather, and when required, re-lacquer. Finally, refit the parts together.

WASTE OF STEAM IN WHISTLING.—A well-posted railway man says that the obligatory tooting of a locomotive on the New York, New Haven & Hartford railroad, in an ordinary day's run, involves a waste of steam requiring the consumption of 250 pounds of coal to renew. He estimates the whistling expenses of that particular railway at \$15,000 per year. There is a similar waste in the howling of the whistles of stationary and steamboat engines. It is a matter worth the serious study of practical railroad men, whether they cannot devise a cheaper noise with which to give notice of the approach of trains to stations and grade-crossings.

CANNED FISH, MEATS, ETC.—A correspondent in British Columbia, who is engaged in the business, gives the following practical information: I recently opened several cans of salmon that were processed in July of 1879, 1880, 1881, and on comparing them with last season's cans, found it impossible to detect the slightest difference. I hold that if a can is once perfectly sealed, the contents will remain unaltered as long as the metal casing remains intact. A can will keep if every portion of the contents has been subjected to a temperature of 212° Fah., whether the air has been expelled or not.

A NEW NAIL FOR FASTENING ON MOLDINGS.—For attaching moldings and other light lumber, a new kind of nail has been contrived, which leaves no nail-holes. It is made with a point at each end and with an outwardly projecting head or shoulder midway between the points. The nail is first driven into the wood by means of a punch which straddles the protruding point and bears on the head. When enough have been driven in, the molding is placed over the nails and driven down.

PAINT FOR DAMP WALLS.—For painting walls or other objects exposed to damp, a composition is said to be much used in Germany formed of very fine iron filings and linseed oil varnish. When the object to be painted is to undergo frequent changes of temperature, linseed oil and amber varnish are added to the first two coats. This paint may be applied to wood, stone, or iron. In the case of the latter it is not necessary to free it first from rust or oily matters.

PULLEYS AND BELTS.—A belt has been known to refuse to do the work allotted to it, and continue to slip over pulleys two feet in diameter, but from the moment the pulleys were changed to three feet in diameter there was no further trouble. These observed facts seem to be at variance with and to contradict the results of the experiments that have been made.

TO CLEAN CERTAIN KINDS OF JEWELRY.—Any gold jewelry that an immersion in water will not injure, can be beautifully cleaned by shaking it well in a bottle half full of soap-suds to which a little prepared chalk has been added, and afterward rinsing in clear cold water and wiping dry.

LAGER BEER.—The English are far ahead of all other nations in the consumption of beer—in the following proportions: The consumption in Great Britain is 30 gallons per head of the population, in Germany 20 per head, and in the United States only seven gallons.

COLOR-STAIN FOR MARBLE.—A good color-stain for marble may be made of equal parts of zinc sulphate, ammonium chloride, and copper acetate (verdigris), all in fine powder; it must be carefully applied.

TO PREVENT DECAY OF WOOD.—A hot mixture of one-third paraffine and two-thirds gutta-percha, forced into the pores of wood, is winning favor as a means of preventing decay.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

LOYAL LEAD.—*Ledger*, April 16: The parties owning this promising mine in the Black Hills, near Drytown, are negotiating the sale to the Valentine Brothers, of San Francisco, the owners of the Mahoney. The sale was to have been consummated last Monday. The purchase price was in the neighborhood of \$50,000. This property gives every promise of being one of the best paying mines in the county. The present owners, seven or eight in number, who have worked it on a small scale with a ten-stamp mill, have made big wages for four or five years past, and have paid for the mine out of the gold extracted. The development, however, has reached a point when it will be necessary to put up expensive machinery. The Pennsylvania, adjoining the Gover on the south, goes with the Loyal Lead. At the Gover between 25 and 30 men quit one day last week. Their wages were a few months in arrears, although they might have been paid at any time had they so desired. A new underground foreman was placed in charge, and some of the men did not appreciate the energetic manner in which he assumed the duties of the position. A cleanup of the mill was made after a run of ten days, which realized \$2500, and this, with other funds in the hands of the company, was sufficient to pay all the strikers, and they were allowed to go. Their places were promptly filled, and mine and mill are running as smoothly as before. W. Boxall has run his prospect tunnel into Matley's hill, close to Jackson, a distance of 300 feet. The rock has been exceedingly hard. Within the past week, the rock has changed to a much softer character, which is an indication that the ledge matter is not far off. Work was resumed on a small scale at the big tunnel at Middle Bar last week. They are prospecting with hand-drills at present. The five-stamp mill of Spagnoli Brothers, at Clinton, was started Saturday last. They have about 80 tons to crush for testing purposes. The five-stamp mill on the Reed & Askey claim, near Pine Grove, has been running for several days. The crushing consists of 100 tons of quartz, which from all appearance ought to yield from \$12 to \$14 per ton. They expect to clean up early next week. It is reported that the Valentine Brothers have bought a controlling interest in the North Gover for \$25,000. Henry Emerson, who for several months has been cleaning up around the old sulphurets works of the Gwin mine, got through with his job last week. He has shipped 14 tons of sulphurets to San Francisco.

SUTTER CREEK.—*Cor. Amador Ledger*, April 16: Work at the Wildman mine is still progressing favorably. At 50 feet the miners came across a drift 30 feet long. Upon examination they found excellent rock in sight, and by cutting into the footwall a couple of feet they also discovered quartz of good quality. This drift, however, has been timbered up. They are now down 75 feet. The large hydraulic pump is completed and ready to be placed in position.

Calaveras.

FROM MURPHYS.—*Cor. San Andreas Prospect*, April 15: At the Oro Plata shaft of the Red Wing, through which the quartz is being hoisted, is a capacious one and well timbered. Three Burleigh drills are in the level and drifts now being run; two of them are kept in motion day and night. To give one an idea of the capacity of one of these drills in an expert's hand, 50 feet was drilled in one shift. Another point of interest is the milling and concentrating departments. Tustin pulverizers are used for the reduction of the quartz, of which there are four. Below the pulverizers are located the concentrators, two of which are running, doing the work of four formerly used with the old belt, but with the new corrugated belt invented by J. B. Morse of this place, better results are gained with half the expense. A big strike was made in the Central Hill gravel mine of McCormick, Bisbee & Thomas. The bottom is full of gold, ounce nuggets frequently picked up; six ounces was washed out in one pan, and 32 ounces washed out yesterday. Several thousand dollars have been taken out of the mine during the past week without a final cleanup. The strike is important from the fact that it veers to the right, as if seeking an outlet in Six Mile creek. Tom Goodwin, of the Calaveras Co., has returned from the city and intends pumping out the water. The other mines from the Calaveras westward on Indian creek, ending with the Esmeralda mine, are doing fairly, and diligent work is being done. The Esmeralda with its ten-stamp mill made a fine run in the last fortnight, and exceedingly rich quartz is now being extracted. I was shown some very rich quartz taken from the Collier mine recently.

SULPHURETS.—*Angels Echo*, April 6: About 15 tons of sulphurets extracted from the Utica mine in this town was shipped to the Selby Smelting Works at San Francisco during the week. The above amount was the result of a month's run of the budle process, which works like a charm. The mines of Indian Creek district are all making a good showing. The Calaveras mine, which has been closed down for several months, is reported to start up shortly. The Kelly mine is running night and day. About 30 men are employed at this mine. The ore which is now being mined is reported to be of high grade, and an immense cleanup is expected shortly. The Wood mine, though temporarily shut down for repairs, will resume operations in a few days. This is one of the best paying mines in the district. Other smaller claims are being prospected throughout the district, many of which are yielding fair returns.

Fresno.

HILDRETH.—*Iron Gold Miner*, April 15: More new ground has been opened up in the Francis & James mine during the past week and the results have been encouraging to its owners, who will probably develop the property further by sinking the shaft 200 or 300 feet, and crosscutting the pay chute. The ore body in the east drift is continuous, but the extent of the pay chute is still unknown, though the indications are that it may extend 350 or 450 feet each way from the working shaft. Louis Wilson will soon resume work on his property—the Wilson mine. The ore worked through Smith's arastra

gave the most satisfactory returns. Since work was stopped the shaft has filled up with surface water, which can be pumped out in a day, however. The mine is an extension of the Francis-James, and everything indicates that the day is not far distant when the Wilson will be one of the best bullion-producers in the camp. Improvement still continues as depth is attained in the Hildreth mine. The ledge holds its own in size, and the ore seems to be of a better milling quality. The mill will commence work on rock that runs \$80 a ton and contains four per cent of sulphurets. It is said that the Dalhousie is one of the finest prospects in Fresno county. The ledge is 3½ feet wide and prospects 20 cents to the pan. The ore carries three per cent of sulphurets that assay \$280 per ton. Offers have been recently made to the owners of the Rough & Ready, by parties who are willing to put up machinery, etc., for an interest, but their propositions have not been accepted. Sinking will be resumed at once, as well as drifting on the east level. F. Scully informs us that a 3-foot ledge, containing one-third galena sulphurets, has been opened up in shaft No. 2, and in order to develop this part of the mine work has been discontinued for the present in the tunnel. The ore in this mine is similar to that in the Rough & Ready. New locations are being made continually, as the record for this district will show. Many of the new finds are looked upon with favor, which shows that prospectors are being rewarded for their trouble. It is well worth while to walk around Table Mountain to look at Lee & Byrnes' prospect. The ledge is 18 inches wide and from it they take enough ore to keep their arastra running. The ore contains 2½ per cent of sulphurets. The Bonanza is an extension of the Lee & Byrnes prospect, and is owned by Clark & Robinson and promises to repay development. Barney and Harry Clark have been getting out \$75 rock during the last 60 days and will soon have 250 tons on their dump to arastra. The ledge is small but very rich. Riley Armstrong and James Mussel have just returned from a prospecting trip on the Last Chance mining belt. They discovered a fine vein of ore about four miles south of the Last Chance mine. It is in slate formation and five feet between walls, with over two feet of solid quartz that prospects fairly on the surface.

Inyo.

NEW COSO.—*Inyo Independent*, April 16: Mr. Hunt, a representative of San Francisco parties, recently bought a mining claim at New Coso, a few miles from Darwin. A large shipment of goods and supplies for the mine are now at Keeler. As soon as this lot of goods can be hauled to the mine, work will be pushed with vigor. J. C. Eddy is running his mill at old Coso. The run will cover a period of some weeks. J. A. McKenzie is getting out ore right along from the Lucky Jim mine. There is still so much snow in the mountains around Lookout that teams cannot get to the charcoal; this delays starting up the furnace. In the meantime more ore is accumulating at the furnace, and teams are hauling steadily from the mines to Keeler for shipment to San Francisco.

Mono.

ARASTRA.—*Mono County Relief*, April 15: We have been informed that the Cleveland mine, in Jordan district, is producing some very good ore. The arastra and water-wheel have been completed and the arastra is now being run to its fullest capacity, three tons per day, on rock from the mine. It is quite probable that Jordan district will make a stir in the mining world in the near future.

Placer.

FOREST HILL.—*Placer Argus*, April 16: Mr. Ed Boyle, who assumed the contract for running the May Flower tunnel, at Forest Hill, in December last, has given it up. The company now intend running it themselves under the superintendency of Mr. F. Chappell. The pumps will be started up in the shaft next Friday. It was nearly full of water, no work having been done in it for over two weeks. The tunnel will now be vigorously pushed forward to completion, which it is expected will be accomplished in about six months.

Nevada.

NO SALE.—*Foothill Tidings*, April 16: The time for which the Crown Point mine was bonded has lapsed, and the deposit of \$2000 forfeited. Mr. Kelly, the gentleman who had the bond on the property, offered an additional \$2000 for an extension of time to May 1st, but it was refused. It is doubtful if Mr. Gauthier will now sell the mine, as daily developments prove the same to be more and more valuable. Arrangements are being made to obtain a United States patent for the claim. The surface ground has been located and improved by settlers, and Mr. Gauthier is giving deeds therefor to them.

THE CENTENNIAL.—*Grass Valley Union*, April 17: The Centennial Gravel Mining Co., of Washington Township, will soon resume operations after suspension during the winter months. The machinery will be driven by water-power. The shaft is 300 feet in depth, with seven feet of gravel at the bottom, and when work was stopped the bedrock had not been reached.

BRUNSWICK MINE.—*Grass Valley Union*, April 13: The Brunswick Gold Mining Company is the name of the new incorporation which has purchased the East Eureka mine (generally called the O'Connor) which is on Union Hill, and east of the Idaho mine, being on the same vein system. The company was organized in the city of New York a few months ago, with a capital stock of \$2,000,000. The trustees are A. A. B. Kellogg, Cornelius Corson, Geo. H. McAdams, Henry D. Murray, Francis H. Grove of New York, W. B. Price of St. Louis, John J. Collier of Louisville, Albert P. Brayton of San Francisco, and George Fletcher of Grass Valley, all prominent in business circles in their respective communities. Since the organization of the company subscriptions to the stock have been taken to raise a fund to pay for the property and to create a working capital, and this having been accomplished to an extent to justify the commencement of operations, there will now be no unnecessary delay in starting work. The 20-stamp mill on the property is in good shape, and can be put to crushing ore as soon as it can be supplied. It is in contemplation to sink a new shaft on the pay chute, the location of which is now definitely determined, but in the meanwhile the mill will probably be kept running on the ore that can be taken out of the drifts and slopes already opened. George Fletcher, as resident director, will have the management of the mine,

and will at once proceed to getting things in shape for regular work. The Brunswick mine is regarded with much favor by the miners of the district.

DELHI.—*North San Juan Times*, April 16: The Delhi mine is away up. It is yielding rock that mills over \$100 to the ton. The ledge is very rich and all the rock taken from it is run through the mill. Candle-boxes full of specimens are taken from the mine in which quartz is the exception, gold predominating. The Delhi is to the Ridge where the Idaho has been to Grass Valley. The Delhi is a bonanza.

San Bernardino.

DAGGETT NOTES.—*Cor. Los Angeles Herald*, April 16: The 60-stamp mill now in course of erection for the Oro Grande M. and M. Co. will be ready to drop stamps on ore from the Waterloo mine by September 1st. The Runover mill, owned by the Garfield Mining Company, is kept constantly running in rich ores from the Garfield and other rich mines owned by the company. The Barber mill, ten stamps, keeps pounding away night and day upon custom ore furnished by chloriders, turning out a constant stream of bullion. The Odessa mill at Hawleys has put on a larger force of men and will commence running on full time shortly. Waterman & Porter's mill at Waterman has shut down for the time being. From what I can learn it is not for lack of ore. The Alvord mine near Camp Cady has shut down, but the mill will be kept in operation crushing some 200 or 300 tons of ore on the dump. The mines at Ord Mountain, which are gold and copper, are looking remarkably well. A party left here during the week for the Soda Lake base metal mines. They have an idea of putting up reduction works in that vicinity. Five stamps have been added to the 5-stamp mill at Mesal, and the mill started up last Friday, one week ago. Rich ground has been lately struck in the mine owned by Bahten Bros., Kerr & Patton, at Providence, silver ore assaying up in the thousands with a goodly quantity of gold intermixed having lately been discovered. It is rumored that the old Bonanza mine, which has in former times yielded so much precious metal, will soon resume operations. Occasional rich strikes of good ore are reported along the line of the railroad.

Santa Cruz.

BLACK SAND DEPOSITS.—*Santa Cruz Sentinel*, April 16: P. Leonard has disposed of a half interest in the black sand deposits on his ranch at San Andreas to a San Francisco party, and a company to work the deposits on an extensive scale will probably be organized before long. An engine and pump will be placed in position next week for the purpose of increasing the supply of water from one inch to three inches. The deposits are about a mile from the beach and half a mile from the railroad station. Mr. Leonard owns 200 acres of land at San Andreas, of which 60 acres have been tested and show that the sand is from four to eight feet in thickness, and averaging from \$2 to \$7 per ton. The sand is about 40 feet below the surface, and to work it a main tunnel 300 feet in length has been run, and from it smaller tunnels branch off. At present 50 tons of sand per day are being taken out, yielding from \$1 to \$5 a ton. "Three men," says Mr. Leonard, "can easily take out 300 tons of sand a day, from which \$100 can be made clear of all expenses. An analysis has shown that of what remains after the gold is extracted 80 per cent is iron." Mr. Leonard intimated that the establishment of iron works on the ranch for the purpose of utilizing the iron after the gold is extracted is among the probabilities.

Shasta.

LOWER SPRINGS.—*Shasta Courier*, April 16: Lower Springs district is flourishing. The Captain Atkins, Calahan & Co. mill, situated on Salt creek, 2½ miles from Shasta, is running on good pay quartz from S. H. White's White Oak mine. The company has a roaster in operation, and will soon have up chlorination works. S. H. White has bonded the White Oak mine for \$10,000 to Baker & Gage, and they are sinking a 100-foot shaft. They are down 45 feet in good pay rock. S. H. White is also sinking a shaft on the Eastern Star, and will go down 100 feet. The quartz prospects fine. White has stuck to the Lower Springs mines with great tenacity, and is in a fair way to reap a rich reward for perseverance.

FRENCH GULCH.—The mine of M. and C. S. Plumb and Charley Webb has about the best exhibit for the work this side of the ridge. It has 80 feet of tunnel, with a 5-foot lode to fall back on. They will probably start up their arastra in eight days; situation on left-hand fork of French gulch.

BONDED.—The Scherer Tellurium mine, near the Middle Creek depot, is bonded for \$50,000, and work is going on, with what result we are not informed.

BEING DEVELOPED.—Wm. T. Coleman has a force of 10 men at work on the mining ground he purchased a year ago, this side of Dr. Dingee's place. A boarding-house and sleeping apartments have been built, and the mine will be developed with all the speed that energy and capital can utilize. We understand that work will be resumed on an extension of the Coleman claim.

GO.—*Cor. Shasta Courier*, April 16: Work has been resumed on the Dayton, J. P. Wright's arastra is running on ore from his new find. It is paying well. The Manzanita is turning out its usual grade of ore, and E. L. Ballou's arastra is running on the same. Shirland & Hubbard are running their arastra on ore from their Creighton ledge. Mine looking well. Hardscrabble is using a full head of water. The brush dam being built to hold back the debris is so far doing its duty. Campbell & Co., now at the Chicago, have been doing some prospect work at the Crystal, and are much pleased with the outlook. Wm. Lee is doing some development work on his claim near the Crystal. Capt. Atkins, and others interested, have been here the past week, looking out a favorable site for a Russell furnace.

Sierra.

MILL.—*Sierra Tribune*: It is the intention of the owners to erect a Forbes mill at the Calico quartz mine this season. From all accounts, that mine will pay to work. It is situated on the Middle Yuba, about three miles above the Savage placer mine. Good prospects have recently been encountered in the old Wheeler quartz mine at Downville. The principal owners of the property reside in the East, and they have been informed of the strike. The Cleveland mine is yielding very good returns under the management of A. W. Crowell. The last cleanup amounted to \$3400. The Alaska

mine at Pike City is working 100 men, and is paying as well as ever.

TO RESUME OPERATIONS.—A *Tribune* reporter met one of the representatives of the Gold Valley Empire quartz mine in Downville last week, and was informed that active operations would be resumed in that quarter in a short time. They expect to employ about 200 men there this summer, and will erect extensive smelting works and all necessary adjuncts thereto. The mine was sufficiently opened last season to warrant the owners in carrying out their plans as laid down when the present company organized. The mine is connected with Sierra City by a good wagon road, and if we mistake not from the information at hand this town will reap great benefits from the work to be carried on there.

INCORPORATED.—The Forest King quartz mine, located in Gold Valley district, was incorporated recently under the name of the Parker Mining and Milling Company, J. D. Fagg, H. H. Robinson, W. E. Parker, M. Lenaban, and Jerry Dooley were elected directors, and T. F. Batelle, secretary. The business office is at Loyalton. From a gentleman who was down from the mine yesterday, we are informed that work is progressing favorably there. The new boarding-house has been completed, and active work is going on underground. There is about seven feet of snow still remaining in the vicinity of the mine.

Siskiyou.

SCOTT BAR.—*Yreka Union*, April 16: The Quartz Hill Company struck a good prospect in their claim this week. A. Milne is working in his claim on Hetchel hill.

HYDRAULIC.—Hon. R. H. Campbell has 12 men at work in his hydraulic claim at Quartz valley, and will increase the force largely at the end of the month.

Trinity.

THE BROWN BEAR.—*Journal*, April 16: From Mr. Henry Martin, superintendent of the Brown Bear mine, who was in town this week, we learn that quartz is looking well in that vicinity, and everything about the mill running smoothly. Mr. Martin is now running a tunnel 4½ feet wide by 6½ feet high, into the west hill to cut the extension of the Brown Bear. He started the tunnel the middle of last January and expects to cut the ledge in two months more.

MINE BONDED.—We are informed that Fred Groteland, of Redding, and another gentleman have bonded the Big Bonanza mine, at Minersville, for a San Francisco company, for \$30,000, the company having until the 10th of May to put up the coin.

Tuolumne.

POCKET.—*Tuolumne Independent*, April 16: Robert Watson & Co. took out a nice pocket from their quartz claim, at Brown's Flat, on Saturday, and a smaller one since.

Ventura.

THE NEW CAMP.—*Cor. Ventura Free Press*, April 15: The Ventura people cannot realize what a rich mineral belt there is in the northeastern portion of this county, and the mines will not receive much support from them. This district is too near home for them to realize and have full confidence in its richness. This district includes a mineral belt at least 20 miles square, with much of it yet to be prospected. In this belt there is about ten miles square of placer ground that will average three cents to the pan. Nuggets have been found worth from \$5 to \$100. The placer ground is spotted and much of it lies in the old river-bed above the present channel. We are informed by a placer miner who has lived in that section for some time that a man can pan out from \$1 to \$10 per day. About 50 prospectors are in camp, and many more are scattered in the mountains. A grocery store has been started in camp, and stock for three other stores is on the way and miners are continually coming in. The ledges of this district are uniform and have the appearance of being permanent ones, whether at the base or on the summit of the mountains. There is an abundance of wood and water, and there seems to be no reason why this will not prove one of the richest discoveries and one of the largest mining camps on the Pacific Coast. It is estimated that in a comparatively short time the mineral resources of this county will far exceed the agricultural resources, and we doubt not that this will be verified. Capital is what is needed in the camp, and that will soon come. We would advise no one to go there at present with the expectation of obtaining employment, as work has not fairly begun, though several parties are at work on their claims. In going from Ventura by wagon, the trip can be made in three days. Take the stage road and turn off three or four miles this side of Newhall, up the San Franciscoquito canyon, to Elizabeth Lake; thence to Gorman's Station; thence to John F. Cuddy's, and ten miles further to Lexington. By trail: Take the Matijia trail to Mart Beckman's, and next day to Lexington via Samuel Snedden's; or take the Nordhoff trail to Mutaw's ranch, and five miles further to Lexington. From Santa Maria, take the Cuyama wagon-road to Treats; thence to Beckman's and Lexington. From Bakersfield—60 miles—take wagon-road to J. F. Cuddy's. From Lancaster, take wagon-road to Gorman's Station.

NEVADA.

Washoe Enterprise.

OCCIDENTAL.—*Virginia Enterprise*, April 16: Extracted six tons of milling ore from the 100 level. No. 3 east crosscut have begun cutting out a station preparatory to sinking an incline winze. From the station on the 100 level of the north incline winze the south drift was extended 10 feet; total length, 66 feet. The north drift was extended 14 feet; total length, 61 feet. Both of these drifts are following a narrow streak of milling ore.

CON. CALIFORNIA AND VIRGINIA.—South drift No. 2 from east crosscut No. 1 was advanced 15 feet; total length, 127 feet. This drift still continues to show fair-grade ore. On the 1400 level raise No. 2 was carried up 12 feet; total length, 97 feet. It continues to show ore of an average quality. The usual amount of ore was extracted and sent to the mills. The pulp assays average about the same as last week.

BALTIMORE.—Good headway is being made in cleaning out the main drift on the 300 level. Once the drift is in order, a raise will be made from it to

the 225 level. The raise will follow the course of the vein. On the 400 level, the old drifts are being cleaned out and put in shape for prospecting. There is much new ground to explore on this level. On the 300 level, the drift which some time ago cut into the vein is being allowed to drain out.

HALE AND NORCROSS.—On the 1300 level the main south drift was yesterday expected to connect with the old Chollar incline. At noon it was thought that the drift had yet about five feet to go. The material is of a very favorable appearance. The south drift on the fifth station level has been extended and timbered 24 feet.

GOULD AND CURRY.—On the 425 level the south-west drift from the main south drift was advanced 15 feet; total length, 135 feet. The face is in hard porphyry. On the sixth floor, the upraise, 42 feet above the track floor, is in quartz, some of which shows milling value.

IOWA.—The shaft from surface to connect with north tunnel is sinking in good ore, also upraise from same tunnel to connect with shaft is following ledge up in fine ore. Other parts of the mine unchanged since last report. The ledge in which the rich gold rock is being prospected is crossing east and west, and is distant from northwest patent corner of Ophir about 1000 feet.

CROWN POINT.—Sufficient ore is being extracted to keep the mills in operation, and a full force of miners is gradually being put into the mine. The main shaft is now in excellent condition, and all is working well and smoothly. The ore extracted is being worked at the Mexican mill, which regularly works 130 tons a day.

YELLOW JACKET.—About 160 tons of ore are daily being extracted and sent to the mills. Most of this ore is being taken out on the 1300 and 1400 levels. Above these levels a good deal of prospecting work is being done, and a considerable amount of ore is being found in the old upper levels.

BELCHER.—Are extracting and shipping about 100 tons of ore a day. This ore is being reduced at the Santiago and Vivian mills. The force of miners is gradually being increased. There is in sight a large amount of ore that will pay a good profit.

CHOLLAR.—Ore is being regularly hoisted at the Sharon shaft on the croppings. They are now about ready to start a drift from the 400 station of the old shaft to connect with the bottom of the Sharon shaft in the old workings.

MEXICAN AND UNION CON.—On the 1300 level the joint Union and Mexican drift running north-easterly is now 455 feet in Mexican ground. The joint Mexican and Ophir east crosscut was extended 25 feet; total length, 357 feet.

HAYWOOD.—The Haywood has been purchased by the original owners. A large amount of ore is in sight on both the 100 and 200 levels and the Briggs and Thompson mills are kept steadily running on ore from the mine.

BULLION.—The east drift on the 200 level is still in vein porphyry, with some streaks of clay and occasional strings of quartz. The station at the 300 level is about completed.

SCORPION.—The east drift on the 300 level has been advanced 30 feet during the week. The face is still in a mixture of quartz, clay and porphyry. No water is encountered.

UTAH.—On the 472 level the north drift from the main west drift was extended 45 feet; total length, 505 feet. The face is still passing through vein porphyry and quartz.

OPHIR.—On the 1300 level the northeast drift was extended 20 feet; total length, 210 feet. Are cutting out a station in the north drift for winze to be designated as No. 1.

OVERMAN.—The usual amount of ore is being extracted from the level of the old Petaluma-street tunnel. The ore is of high grade, but pays very well for working.

SIERRA NEVADA.—On the 520 level west crosscut No. 8, from the south lateral drift No. 2, was extended 45 feet; total length, 213 feet. The face is in porphyry.

BEST AND BELCHER.—On the 1500 level east crosscut No. 1 has passed through a hard porphyry streak and entered soft porphyry, mixed with a little clay.

JUSTICE.—The usual amount of ore is being extracted on the 250 and 310 levels to the course of prospecting operations.

ANDES.—Prospecting on the 200 and 300 levels and extracting the usual amount of ore, which is being saved for working.

ALPHA AND EXCHEQUER.—The work of sinking the shaft below the 120 level is progressing favorably.

OEST.—The new whim works well, and a large amount of good milling ore is being hoisted.

VIVIAN.—A considerable amount of good milling ore is being extracted.

Cherry Creek District.

EXCHEQUER MINE SOLD.—White Pine News, April 16: From a gentleman just in from Cherry creek, we learn that Fred Frank and a man from Salt Lake have purchased the Exchequer mine and mill at Cherry creek from Murdoch & Cahoon. Mr. Frank and partner now own the two best mines and mills in that district, and the showing in both mines is such that they feel confident of keeping the two mills running all summer. This is good news for Cherry.

Hawthorne District.

GOLD.—Esmeralda News, April 16: Last week Arthur George, Syl. Light and Phil. Bowers shipped to the Reno Reduction Works three tons of gold ore from the Pamlico mine in Hawthorne district, 2½ tons of which netted the boys \$3000, the remaining half-ton being worth \$600. This result is the product of six weeks' work. There are other mines in the district from which, with proper management, a like result might be obtained. The mine was leased to the boys, not because it was then considered valuable, for it was not, but with the hope of discovering something rich. It is such men that bring out a camp, and not the Micawbers who sit around holding on to mines and expecting some one to come along and pay them a fancy price for their claims.

Jackrabbit District.

THE ONONDAGA.—Pioche Record, April 14: The Onondaga mine is looking well. From its inception this mine, which is in limestone, has differed from

every prospect or mine ever struck in the limestone district of Jackrabbit. All others have been a series of pockets, alternately opening and pinching down to the usual knife-blade iron seam to follow, through money and hard lucks, or abandon through sheer discouragement and consequent distrust of the treacherous formation. From the first shot put into the Onondaga, this mine has not shown the least sign of "pinching," but has held its own nobly, gradually improving in both quantity and quality of the ore streak, varying from one to three feet in thickness, showing up a true fissure, with well-developed hanging and foot-wall, as work progressed. Shipment after shipment of Onondaga ore has been made, netting its owners a fair profit. At this writing, the winze being put down from the tunnel level is 65 feet deep, and the average assay of the ore is \$114.65 silver, the percentage of lead being high.

YUBA.—The work of retimbering the shaft of the Yuba mine will be commenced in a day or two, preparatory to starting up mining operations in that mine. On the ninth level of the Yuba there is said to be a large body of lead ore, containing nothing refractory in regard to smelting. Years ago some very good ore was extracted from the Yuba. In those days the demand was for free milling ores—lead ore was at a discount. The milling ore of the Yuba pinched out the lead coming in, the mine was shut down, and eventually the shaft timbering below the second level rotted and tumbled down the shaft, filling it with debris. The estimated cost of refitting the mine is somewhere about \$10,000. Mr. Sam Godbe is to assume control.

Sprucemont District.

THE CAMP.—White Pine News, April 16: Ho, for Sprucemont! seems to be the slogan of the surplus population of Taylor. A loaded team went out Wednesday for the new camp. It is the general belief that 150 men will find employment there this summer. Ben Miller has secured the contract for hauling the ore from the mines to the furnace.

Taylor District.

SHUT DOWN.—White Pine News, April 16: The Argus mill was shut down yesterday, owing to lack of ore, the teams being unable to keep up with the stamps. About a week's headway will be given the teams.

Wild Rose District.

CONCENTRATED ORE.—Silver State, April 16: One of the Paradise Valley Co.'s teams arrived yesterday with 16,000 pounds of concentrated ore. This morning E. Reinhart & Co. shipped 32,000 pounds of concentrated ore to Argo, Colorado.

Willow Creek District.

ARASTRAS.—Cor. Silver State, April 14: Mining matters are about as usual. Faith in the district still remains unshaken. Choate Bros. have set their arastras in motion. Crushing commenced yesterday, and the machinery is said to be moving along smoothly and doing effective work.

ARIZONA.

AROUND PRESCOTT.—Courier, April 16: The St. Louis Yavapai M. and M. Co., of this county, is making regular shipments of silver to St. Louis. Mill is working tailings of Tiptop mine. The company is opening up a good mine on the crosscut. Mr. J. M. Threxton will soon erect a 20-stamp mill for Diamond Joe, in Bradshaw district. The Gray Eagle, one of the richest and largest gold mines in the county, will shortly change hands. The output of water is being taken advantage of by placer miners, and considerable gold dust is the result. There is a rumor to the effect that a Mr. Nichols has been offered \$100,000 for a gold ledge recently discovered by him in Weaver district. Mr. Douglass, mining expert, was here recently, examining the United Verde. W. W. Davis, of Hassayampa, and John Hughes, of Turkey creek, like all miners, think that the era of bullion production has come to stay. Mr. Abel, of Bradshaw, tells of great activity in his section. Mr. Douglass Gray came in yesterday from Agua Fria, where several good leads are being developed.

AROUND PRESCOTT.—Courier, April 9: B. T. Riggs and John Lawler came back to town Thursday from their mines in Santa Maria district. They have had ore from these mines tested and are satisfied. They are wet ores, just such as will be in demand when a general smelter shall be set at work here. J. A. Park, who, besides being a good, practical miner, is a first-class assayer, has gone back to his properties in Hassayampa district. He, too, has a mine that is wealthy in silver and lead. Mr. F. M. Murphy, who has devoted money, time and attention to making known the mineral resources of Arizona, returned recently from a tour of the mines, and tells of the many tons of rich ores he saw on dumps, ready to be shipped to the Prescott sampling works, which will be running in 10 or 12 days. Wm. Jennings is credited with owning a very rich silver mine in Hassayampa district, and we are sorry he is not working it. Mr. John S. Jones will soon start active operations in Groom Creek district. He has strong Eastern backing, but will go slow until he learns just what kind of process is required to get the metals from the ores. We have lived in this section since 1864, have done some mining, witnessed and heard of many failures, but have never lost faith in the mines, and are, to-day, pleased with ourself for having "stayed with" the interest, which is now fast becoming the leading one of this section. Miners, too, are every day opening new treasure stores and do not, as formerly, grumble at "the country." We mean miners who own mines and work them.

IDAHO.

TREASURE BOX BULLION.—Murray Record, April 14: To-day the Treasure Box company had a 62-oz. gold bar run at the Excelsior assay office; value about \$1023. This is the result of 10 tons of quartz and is only a partial cleanup, the bed of the arastra not being taken out. It is well known that by crushing ore in an arastra the amalgam works down in the crevices of the rock bed in the tub, which is only removed and a thorough cleanup made when the bed is worn out. At this rate their ore is enormously rich.

SEVEN DEVILS' MINING DISTRICT.—This mining district is situated in the northwest portion of Washington county, Idaho, about 75 miles from Weiser City, and is accessible by roads and trails up the Weiser valley. The district was discovered by Levi

Allen, of Boise, I. T. J. J. Lewis, of Wood River, and the ex-Governor of Montana are interested with Allen in several locations. These and other leads have been considerably developed, some showing large bodies of ore. Assays have been made showing from 45 to 60 per cent copper, from 16 to 20 ounces of silver and from \$8 to \$12 of gold per ton. The elevation of the camp is between 5000 and 6000 feet. About 30 men have been pushing work during the past winter, and lively times are anticipated this summer. The Union Pacific Company has had an engineer corps in the field surveying northward from Weiser City. The ultimate purpose of this road is to tap the North Idaho country.

YANKEE FORK.—Cor. Challis Messenger, April 14: The mining interests of the camp are not lagging. Wm. McQueen, of Salt Lake City, took charge of the Dickens mine some weeks ago; the Norton Hill has taken on new life. There are 12 to 15 men employed; the mine has been drained and works carried down the vein into new ore, rich in both silver and gold. The old ledge, or original Dickens, has at present a large vein of rich ore, while the small or south vein also shows fine ore.

THE WASHINGTON.—Mr. Morrison, on the Washington, west of the Dickens, has been running and sinking 90 rich ore, all winter. He has now, at the least estimate of miners, over \$150,000 worth of ore in sight—some put it at \$200,000. He is sinking in the lower tunnel, and has about one foot of \$1000 ore—same quality as in the upper tunnel. Six to eight men are employed.

THE CUSTER MILL.—The Custer mill runs along as usual, producing a goodly quantity of silver and gold bullion. Myron Crafts is an experienced metallurgist and practical millman. Dan Murphy has charge of the company's mines.

SHEEP MOUNTAIN.—Messrs. Barber, Brown, and Evan Jones are in the Sheep Mountain country. The mines are looking well, according to last reports. It is expected Sheep Mountain will have a boom this season. The mines are rich and easily opened.

STANLEY BASIN.—A number of placer miners have already gone to Stanley basin, and others will follow soon. The Muloch placer ground, on Joe's gulch, has opened out very rich this winter. Mr. Muloch has a pay streak 15 feet wide which prospects 15 to 30 cents per pan. He recently rocked out four ounces in one day by way of prospecting the pay streak. Everything taken together, it looks now as though the west end of Custer county will make quite an advance in development and prosperity this season.

MONTANA.

WEST OF ANACONDA.—Review, April 16: The work in and about Silver Lake has commenced in earnest, and though the snow is not fully gone enough for general prospecting, there are bare spots on which those familiar with that district and have had their ground marked are now at work. The stage out of Anaconda is loaded each day with passengers going to the richest mineral-bearing belt in Montana, that from Anaconda west to Phillipsburg. A greater portion of those going out into the hills now start for Silver Lake and Georgetown. The oldest mining men in the Territory all say that they are as confident that the mineral belt west of Anaconda is as promising as any in the Territory, and that all it lacks is to be thoroughly prospected. At Georgetown the Pyrenees is still running and some important developments have been made. It has been generally understood for some time past that Eastern parties were negotiating for this mine for a sum, said to be about \$200,000, but as yet the sale is not consummated. There are a number of other claims in the immediate vicinity of Georgetown which are attracting considerable attention, prominent among which are the Dardanelles and the Luxemburg, in both of which Saltoo Cameron has considerable interest. The Grubstake, which is located about two miles northwest of Georgetown, is the mine for which the company was incorporated to work last winter. The work of developing this property on an extensive scale will be commenced at an early day. At Silver Lake the Congdon boys are hard at work on the Silver Reef, taking out ore and piling it up on the dump. They expect to commence shipping ore as soon as the roads will permit hauling to Anaconda. This mine was bonded last season to parties at Salt Lake, but they failed to materialize and the boys now have it, and from present indications they are not the losers by the failure of the parties to take up the bond. In Oleson gulch, Sawtelle & Co. are working on their Silver Chain mine and taking out a small amount of ore. The bad roads render the hauling to Anaconda and shipping an impossibility. Wm. Seebe and Mr. Gunn have discovered a very valuable gold lead in another quarter of Oleson gulch, which promises to be something good. Sawtelle is said to have another even more valuable property than the Silver Chain. In the Blue-Eyed Nellie district every portion of the hill is staked out in claims, all parts of which are said to be fully equal if not superior to the original location. It is known that there are now at least three mines on this hill, the Nellie, the Boomerang, and the Katie Darling. The Nellie is known to us all. The Boomerang has received notice at our hands several times, and is proving to be all that was claimed for it. The Katie Darling is the latest addition to the valuable properties on Carbonate hill, and it bids fair to compete with the Nellie. There is but one claim between it and the Blue-eyed Nellie, and the ore was found the same as at that mine, at the grass roots. We were shown this week a number of specimens from this prospect, which are exactly similar to the Nellie's. A shaft is being sunk on it and we expect to hear any day that the main ore body has been reached. A number of parties pronounced it the most valuable prospect west of Anaconda.

BUTTE.—Inter-Mountain, April 16: Very cheerful is the mining outlook for Butte just now. The big companies are not making much noise, but there is a great deal of work going on and more men employed than ever before. The Anaconda is producing tremendously and seems to be making a desperate effort to offset the low prices by a wholesale output. The other copper producers are maintaining their splendid record and are intelligently using past experience in the direction of a necessary curtailment of expenses. They are now mining, hoisting and treating ore at a less rate per ton than at

any previous time in the history of the camp. The best news of the week is the declared intention of the Bluebird to add 20 more stamps to its 70-stamp mill. There is plenty of motive power, sufficient room and abundant ore to justify the proposed increase. With 90 stamps in operation the company will not only have the biggest dry-crushing, chloridizing mill in the United States, but the biggest in the world. Mr. Van Zandt is also authority for the statement that a second mill to contain 40 stamps will also be erected in the near future for Bluebird ores. A good deal of quiet work is being done on other well-known silver mines. On the Amy and Silversmith the shaft is being sunk from the 400-foot station to a depth of 500 feet. On the floor of the 400-foot level on the middle vein the ore was rich and compact, and there is every reason to believe that the new level when opened up will fully maintain the reputation of the property. It is probable that the other veins traversing the claim will be crosscut and exploited. On the Orphan Girl also the shaft is being sunk and the quality and extent of the shoot in the upper levels give reason to hope for important developments below. The Cora, Acquisition, Gagnon, Burlington and other properties frequently mentioned in our local columns are all in an active state of development, and are daily adding to the royal record of the greatest mining camp of the age.

NEW MEXICO.

HERMOSA.—Black Range, April 14: The carload of ore from the Palomas Chief, 12 tons, returned 157 ounces silver and 6.2 per cent lead. It was treated at the Graphic smelter at Socorro. The work on the Atlantic Cable still progresses and continues to show good ore. A drift has been driven easterly on the contact a distance of about 30 feet, besides the driving of the adit into the bowels of Treasure Hill. Roberts & Guthrie have finished their contract on the Embolite mine, and the ore is sacked and piled on the dump ready for transportation. On the Pelican, Vulture, Albawoss and Eagle group of claims there are 22 men at work, the ground having been parceled out to leasers, who are always ready to take the ground of these valuable properties. Mr. Marshall has developed a fine showing of ore in the south drift at the 50-foot level on his Humming Bird mine. There is also a fine showing in the several adits to the west of the shaft.

OREGON.

CLEANUP.—Jacksonville Times, April 16: Another cleanup was made at Wm. Bybee's claim near Waldo recently, which realized a few hundred dollars. The rains of the past ten days have increased the water supply considerably, which will prolong the mining season. Brown Bros., who are engaged in mining in Wm. Bybee's claim on Rogue river, have done good work this season. Wm. Coker of the California M. Co. has returned to Krbville and work will be renewed with vigor on the ditch between Sucker creek and Illinois river. Mr. Sterling, of Polk county, is in the vicinity of Rogue river, searching for what is popularly known as the Boulder ledge. Some excitement exists in the Briggs' Creek mining district, Josephine county, a large portion of which has been taken up again. Good prospects have been struck. John Chambers and Miller Maury, who have been mining on Louse creek, Josephine county, finished a good run not long since. They have since sold out at a fair figure. Wm. Hamlin has struck excellent prospects on the mining ground he purchased of C. C. Beckman, near Grant's Pass, some time since. Jas. Ferren and son and N. Thoss are engaged in mining some first-class ground in the Silver Creek section. Mr. Reeve, who is engaged in mining on the Klamath river near Happy Camp, made a cleanup of \$28,000 after a 14 days' run, besides cleaning up \$3500 a short time before.

UTAH.

PARK NOTES.—Park Record, April 16: Prof. J. E. Clayton, who recently examined the Ontario mine, in speaking of the future prospects of this great property, in his report which will soon be published, says: "The new ground west of No. 3 has been explored by extending the 600-foot level to the west end line, a distance of 2800 feet. The 1000-foot level is now in about 1000 feet west of the shaft and is in one of the largest ore quites ever found in the mine. Taken as a whole, the mine never looked more promising than it does now. Notwithstanding the great cost of opening and draining this mine, it has paid large dividends to its shareholders, and will, no doubt, continue to pay its usual dividends for many years to come." Last Friday week the Crescent miners broke into the Boss workings, put the latter's men to flight and took possession of the disputed ground. The ground in dispute is said to be very valuable, being extensively mineral bearing. F. W. Hayt, manager of the Southern Tier group, is down from an inspection of the late strike in the mine. The vein encountered in the lower tunnel averages nearly two feet in width, and some exceedingly fine-looking rock has been taken from the ledge. Assays of average samples of the new find run from 2000 to over 4000 ounces, samples of what may be considered as third-class dirt going as high as 180 ounces, with a fair percentage of lead. This good news permanently settles the fate of Snake Creek district, for although prospecting has not been extensively carried on, enough has been done to prove the continuance of the Southern Tier veins for at least three miles, the croppings at many of the claims carrying enough of the precious metals to pay for shipping. The Daly mine is in a very prosperous condition, and is fast making a record equal to its twin sister, the Ontario, for being a rich producer and big dividend-payer. Four new Frue vanners are in operation at the Crescent concentrator. The present fine weather is drying up the roads, and from now on ore shipments will be increased.

ORE AND BULLION SHIPMENTS.—For the week just ended, the Mackintosh sampler received 205.120 pounds of Ontario ore. The Marsac mill shipped on the 14th inst. seven bars of Daly bullion, containing 7500 fine silver ounces. The shipment to-morrow will be six silver bars. On the 9th, the Ontario shipped 37 bars of bullion, containing 20,414 fine ounces of silver. The Crescent shipped during the week the first new lot of concentrates, aggregating 434,023 pounds, to Denver. A 20-ton lot of first-class ore was also shipped to Salt Lake,

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar or repairs.

Golden State and Miners' Iron Works.

Sole Manufacturers,

237 First Street, San Francisco, Cal.

THE FRISBEE-LUCOP MILL,**A CENTRIFUGAL ROLLER MILL**

—FOR WET OR DRY—

Reduction of Ores, Quartz, Phosphate Rock, Carbon, or other Mineral Substance to any degree of fineness in a rapid and economical manner.

Any method of amalgamation may be applied.

At 300 revolutions per minute will pulverize 2000 pounds of quartz per hour to 60 mesh dry, and from 3000 to 6000 pounds wet.

All wearing parts easily and cheaply replaced. May be seen in operation at the New York Metallurgical Works, 104 and 106 Washington St., and Pacific Iron Works, San Francisco.

Certificates as to performance of the Mills, and any information required, furnished on application.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Affairs in the mining stock market are quiet, fluctuations being slight. Up on the Comstock at the middle mines they will now soon be ready to do a good deal of crosscutting. The main south drift on the 1300 level of the Chollar, when connected with the main incline will give a fine circulation of air, and will open up a large area of ground in which cross-cuts may be made. Much good ore is being shown up in the Savage, and were there milling facilities large shipments of bullion would be seen.

When mills are put up great activity will be seen in Pototsi and all the middle mines. There will be new life in all that section. Now little is being done in the Pototsi. All the drifts and openings in the lower levels are filled with ore, and nothing more can be done until there is a chance to mill this ore.

At Gold Hill all is again getting into good working shape at the Crown Point and Belcher. There is in sight a large amount of ore, and it can be taken out as fast as there are facilities for its reduction.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Bluebird, April 13, \$33,440; Alice, 13, \$25,000; Hanauer, 13, \$17,000; Bannock, 13, \$27,500; Alice, 14, \$8,651; Hanauer, 14, \$33,500; Lexington, 15, \$44,480; Bluebird, 15, \$32,443; Moulton, 13, \$15,664; Silver Bow, 15, \$21,728. Last week Wells, Fargo & Co. shipped from Salt Lake in bullion \$49,631; McCormick & Co., \$54,110; T. R. Jones & Co., \$11,480; Union Bank, \$20,355.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

WATER FOR THE COMSTOCK.—The new line of flume to convey water from Martell lake to the Comstock, to be used as a motor for driving stamps for crushing ore, will strike the east line of Mount Davidson 34 feet above the grade of the old line. The stream flowing through the flume will have a volume of 100 miners' inches. The pressure of this volume, falling through a pipe at the level of the collar of the Combination shaft, will be 186 pounds to the square inch. It is proposed to increase this pressure to nearly or quite 1000 pounds to the square inch by dropping the water through a pipe on a 60 inch Luffa turbine wheel placed on the Suto tunnel level of the shaft, 1640 feet below the surface. This will give a fall of 2000 feet from the flume. This power will be transmitted back to the Combination shaft and to the stamp-mill to be built on the surface below the Coollar shaft. By steel-wire battery this pressure will furnish motive power sufficient to drive 250 stamps.

A BIG CONTRACT.—Secretary Whitney has awarded to the Bethlehem Iron Works Company of Pennsylvania the contracts for furnishing about 14,000 tons of steel gun forgings and 4500 tons of steel armor plate at a total cost of \$4,512,938. Its bid, though not the lowest for gun steel, was the lowest in the aggregate for the two contracts.

BACK NUMBERS WANTED.—In order to complete certain files of the MINING AND SCIENTIFIC PRESS, we should be glad to get certain back numbers. Any one having any of the following numbers of the PRESS will please communicate with this office:

1869—Jan. 24, 29th, 16th, Feb. 27th, March 20th, April 17th, 24th, May 1st, June 12th, 19th, 26th.
 1876—Sept. 11th.
 1886—July to December.

IN searching for water near the town of San Luis Obispo, a bed of coal has been discovered. The extent of the deposit is not yet determined. The coal find is near the proposed Southern Pacific railroad line.

New York Metal Market.

Telegraphic advices dated April 21st give the following New York prices:

BAR SILVER—95½@95½ per oz.
 BORAX—54½@54½.
 COPPER—LAKES—\$10.40.
 IRON—No. 1, \$22.00.
 LEAD—\$4.30@4.36.
 QUICKSILVER—63½@64.
 The following is the latest by mail from the "New York Metal Exchange Market Report":
 COPPER—Dull, spot closing at \$10.30@10.46. Transferable Notices (Lake) issued at \$10.35@—, Transferable Notices (Chili Bars) issued at \$9.17½.
 LEAD—Dull at \$4.30@4.40 spot. Transferable Notices issued at \$4.30.
 TIN—Quiet at \$22.45@22.50. Transferable notices issued at \$22.60.
 Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' prices, closing at \$10.35@10.46. Transferable Notices (Lake) issued at \$10.35@—, Transferable Notices (Chili Bars) issued at \$9.17½.
 LEAD—Dull at \$4.30@4.40 spot. Transferable Notices issued at \$4.30.
 TIN—Quiet at \$22.45@22.50. Transferable notices issued at \$22.60.

TRAVELING AGENTS WANTED.

We want a few enterprising, active, faithful men to visit different parts of California and the neighboring States, making the merits of our journals better known to the many people who would be helped thereby, taking orders and receiving payments. Here is a good opportunity to see the country, earn a useful enterprise, and, at the same time, earn a good, honest

The Lithographer Publishing Co.
PUBLISHERS OF THE
"AMERICAN LITHOGRAPHER AND PRINTER,"
Have in course of publication
A DIRECTORY
—OF THE—
Lithographic and Allied Trades,
CONTAINING A COMPLETE LIST OF ALL

Lithographers, artists, designers, photographers, photo-
litho, and photo-engravers, printers in all graphic arts, en-
gravers in all branches, electrotypers, bookbinders, art-
publishers, paper-makers, lithographic and printing ink
manufacturers, all firms and persons engaged in lithographic
and photographic supply houses, manufacturers of and
dealers in lithographic and printing machinery, stationers,
and in fact all who are engaged in these and kindred trades.

Although such publications are issued annually in En-
gland and Germany, yet there is absolutely nothing of this
character in this country.
The success of our Directory is already assured. Our first
edition is guaranteed by contract to be 5000 copies.
The subscription price is \$3.00, and will be \$5.00 after
publication. No payment whatever is to be made in ad-
vance. Addresses will be inserted free of charge under
three different headings, and firms moving on May 1st will
oblige us by sending us immediately notice of their change
of address.

The advertising rates will be as follows:
Full page, 7 full lines.....\$35 00
Half page.....20 00
Quarter page.....12 50
Eighth page.....8 00

Pages of display or illustrated advertisements will be in-
serted, if printed for us, at the same rates, when delivered
in 5000 copies.

All advertisements must reach us by May 10th next.

For particulars and circulars add us

A thoroughly wide-awake trade journal, that will amply
repay advertisers in its line. Price \$3 per year.

Steam Engine Catechism.

A SERIES OF DIRECT PRACTICAL ANSWERS TO DIRECT
PRACTICAL QUESTIONS—MAINLY INTENDED FOR YOUNG
ENGINEERS AND FOR EXAMINATION QUESTIONS.

—BY—
ROBERT GRIMSHAW, M. E.

This book is intended to answer not only "such direct
questions as have been asked by both theoretical and
practical men," but "questions chosen with the view of
saving the reader a long search after some point, and en-
abling him to get directly at the information desired." For-
mulas and mathematical gymnastics are avoided. While
the book is not written for professional men, it is
technically correct and up to date. Published in two
parts. Price of each part, \$1, postpaid.

Part II of the STEAM ENGINE CATECHISM con-
tains answers to further practical inquiries received
since the issue of the first volume. Sold by

DEWEY & CO.,

SILVER-PLATED AMALGAMATING PLATES FOR SAVING GOLD

—IN—

QUARTZ AND PLACER MINING.

The Most Extensive and Only Successful Manufacturer of these Plates on the Pacific Coast.

OVER 3000 ORDERS FILLED!

Only Refined Silver and Lake Superior Copper used. Weight Guaranteed.

Old Mining Plates Bought, Replated or Gold Separated.

Awarded every Medal for Silver Plated Mining Plates on the Pacific Coast for the last 15 years.

These Plates can also be purchased of **JOHN TAYLOR & CO.,** Dealers in Assayers' and Mining Material, 112 to 118 Pine St., S. F.

NOTICE.—My Silver-Plated Plates are well known, and in use everywhere. They still continue to assay at least one quarter more silver for the same money than any plates made here. One trial of my plates in competition will prove this. Light, thin silver-plating looks the same as heavy, but has no durability.

THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, **SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.
